CHEMISTRY and INDUSTRY
REVIEW

VOL. V, 1927

LONDON
THE SOCIETY OF CHEMICAL INDUSTRY
CENTRAL HOUSE, FINSBURY SQUARE, E.C. 2

JOURNAL of THE SOCIETY OF CHEMICAL INDUSTRY CHEMISTRY & INDUSTRY

Official Organ of the Institution of Chemical Engineers, of the Coke Oven Managers' Association, and of the Federal Council of Pure and Applied Chemistry

which consists of Representatives from

The Chemical Society, the Society of Chemical Industry, the Association of British Chemical Manufacturers, the Institute of Chemistry, the Society of Public Analysts, the Faraday Society, the Institute of Brewing, the Society of Dyers and Colourists, the Society of Glass Technology, the Iron and Steel Institute, the Ceramic Society, the Institution of Gas Engineers, the Society of Leather Trade Chemists, the Royal Photographic Society, the Mineralogical Society, the Biochemical Society, the Oil and Colour Chemists' Association, the Institute of Metals and the Royal Agricultural Society.

VOL. 46 **NEW
SERIES**

LONDON, JANUARY 7, 1927

No. 1

EDITORIAL

A Year's Legislation

THE year 1926 has, in many respects, been a memorable one; we should be glad to forget it, but are unable to do so. As we review it we find that it has been one of the wettest and least sunny of all the years: it has also been the occasion for the most disastrous strike that has ever occurred in this country. We shall make but little comment on the strike and its dire consequences: the ordeal by battle has been superseded by many modern expedients as a method of settling a dispute; let us hope that the chemical industry, if not all industries, will learn from this great struggle such lessons as any reasonable man may conveniently note. The chemical industry felt the strike very acutely, but perhaps less than might have been expected: it is an industry of recent and rapid growth; it is free from many embarrassing relics of the past: it has had more than the usual proportion of well-educated, clear-thinking and far-seeing men, and has built up sensible methods and traditions: it is essential that these should be maintained, for the chemical industry and the chemical branches of other industries are destined to be second to none in the kingdom. Legislation is State interference; it is sometimes necessary and is very seldom beneficial to well-conducted and reasonable people; so far as the chemical industry is concerned our New Year's wish is that there may be little legislation and little occasion for it. A few enactments, hardly of first-rate importance, require some special mention here. Of these, perhaps the most noteworthy is the Order of the Ministry of Health known as the Public Health (Preservatives etc. in Food) Regulations, which is already in force, except in respect of bacon, ham, butter, cream, and a few other articles of food. The order appears to us to adopt a novel, almost singular, expedient; it does not prohibit the preservatives that are known to be injurious, it prohibits all preservatives except sulphur dioxide and the sulphites and benzoic acid and the benzoates. It would seem to be of little use for the chemists to discover or invent new preservatives, and yet we can hardly

suppose that 20 years hence no other compounds will be known worthy to rank with the sulphites and the benzoates. We hope that the order will prove beneficial to the community, but our hope is accompanied by traces of misgiving. Aseptic surgery is probably better than antiseptic surgery, but there are many articles of food which are condemned by the present order and yet are more wholesome than food imperfectly treated with preservatives. In the next few years we shall probably become better acquainted with the flavours of sulphites and benzoates; if we get tired of these, how refreshing it will be to go to Jersey or Paris and enjoy the borates and salicylates and formates and any other prohibited compounds; it will be almost like the Americans coming here, not a reason for the journey, but an added pleasure. A less controversial order is being issued by another Government department, the Home Office, dealing with the conveyance of carbon disulphide by road; it is to be conveyed only in steel or iron containers of a specified type or in luted bottles packed in a particular manner; no artificial light capable of igniting inflammable vapour is to be allowed on the vehicle, and no one, while on or attending to such a vehicle, shall smoke. We suppose that the driver will occasionally, in some unfrequented locality, stop and leave the vehicle unattended, while he searches in his overcoat pocket for the remains of the gasper for which his soul has craved. Other regulations are being issued by the Home Office in pursuance of the Lead Paint (Protection against Poisoning) Act. The danger of lead poisoning arises from the process of dry rubbing down, and the regulations state that no painted surface shall be rubbed down or scraped by a dry process; women and young persons, with certain exceptions, are not to be employed in painting with lead paints, and there are other provisions for notification of lead poisoning and for the analysis of paints by inspectors of factories. It is not easy to give a general account of the Public Health (Smoke Abatement) Act, nor the Merchandise Marks Act, nor the Fertilisers and Feeding Stuffs Act. Some of these will

require careful consideration, but the really interesting features of such Acts depend on the study of their exact verbiage and its careful analysis. Manufacture in this country is the care of the Merchandise Marks Act; you may import your malt and sugar from one country, your yeast from another, your colouring matter from a third, your bottles from Czecho-Slovakia, your corks from Portugal, your labels from Germany, your packing cases from Norway, and still sell the liquor as Scotch. Probably there are many people who already know exactly what degree of home origin or home workmanship is necessary to escape the badge of "Made in Latvia." We are not of that number.

Looking Backward

The able surveys of past and future conditions furnished by Mr. Woolcock and Mr. Furness are worthy of very careful attention. They bring out many interesting features and tendencies. It seems that in the chemical industry the distinction between organic chemistry and inorganic chemistry has disappeared. The great merger resulting in Imperial Chemical Industries has brought into one organisation a number of industries, some of which have hitherto been in a state of dignified but precarious isolation. It would seem that there is room for a few other amalgamations in this country, and the pooling of knowledge gives an amalgamation a distinct advantage over several isolated undertakings. It is an extraordinary thing that there should exist in this country a company with a capital of sixty million pounds engaged in the manufacture of so considerable a variety of chemical compounds; it is difficult to imagine what will be the state of the chemical industry fifty years hence. The artificial silk industry has effected a revolution in the textile industry. Who can say what revolutions are in store for the coal industry, the iron and steel industry, the linen industry, the leather industry, and the rubber industry? The manufacture of pyroxylin varnishes grows apace; pyroxylin is a convenient term which includes all those cellulose nitrates which are soluble in amyl acetate and methyl alcohol. These solvents are now made in large quantities, and other solvents are also being developed. Every year we find that fresh manufactures are undertaken here: such compounds as formaldehyde and para-formaldehyde are now made here by Synthite Limited, and possibly other manufacturers; as each compound is made new solvents and new reagents have also to be made. The new ebontes, xylonites and such materials become of increasing importance. The last year has not been a time of rejoicing; delays and disappointments have been its special feature; in many respects the year has been wasted in this country, and we can never recover the waste. It is impossible to regain time spent in idleness. To many of us the only redeeming feature of the great strike was the fact that at one time it seemed as if it would be far worse.

Looking Forward

It is natural that the winter solstice should be a season for mental stocktaking, and that so soon as the mornings begin to be a little lighter we should all look forward to a year of fine weather, good times, prosperity,

and happiness. In the chemical industry we have every reason to feel confident that we shall be more prosperous in 1927 than we were in 1926, and one reason is that the chemical industry is conducted upon scientific principles. The application of science to business should not be confined to the laboratory. The essential scientific principles are that the same causes will in similar circumstances produce the same results, that an investigation of the causes and circumstances will enable you to predict the results, that you may learn to vary the circumstances so as to give you different results provided only that you have found out the laws which govern the operations, and that accurate observations will be a better guide than vague generalities. It is true that these principles are more manifest in the laboratory than in the counting house or the drawing office, but it is merely a question of degree. The solution of industrial problems whether in the works, in the markets of the world, in the laboratory, or in the domain of accountancy, requires the same sort of careful observation, of accurate recording of logical reasoning and hard thinking. The manufacturer who sees how quickly a chemist will perform some simple operation is apt to forget that this speed is the result of many years of study and many months of practice. The chemist who sees a manufacturer rapidly coming to a right decision may also forget how many years of accurate thinking, of acute observation, and of experience have been necessary for this process. The essential difference between the two classes of men is that the scientific man is usually in control of his circumstances; the manufacturer is usually controlled by them. The war, the waste of money it involved, the high taxation, the rise in prices, the industrial unrest, and the great strike were circumstances which the individual manufacturer was powerless to alter. He could merely adapt his plans to them. At the moment no specially disadvantageous circumstances are apparent: the world is poor, and willing to become richer; many people have realised that work is more profitable than arguing, squabbling or fighting; many people have realised the futility of large committees, divided responsibility, and the advice of large numbers of inexperienced and scantily informed enthusiasts. The scientific method is to take only the reliable observations as a guide and to ignore the unreliable. The atomic weight of molybdenum and the best arrangement of a banking system are not to be determined by the opinions of the first hundred people of both sexes you may meet in the Strand or the Whitechapel High Street. We are learning these facts, because of this and because of the lack of obvious elements of danger, we all feel that we are through the worst of the depression. We feel that things are beginning to mend; we look upon a serenest sky and anticipate the glorious sun. There is no reason why the year 1927 should not be a busy and a prosperous year; we have every confidence that it will be such; it will mean hard work, and we shall be glad to work hard. Things are already better, and we trust we shall soon be able to record that they are good. We publish in our advertisement columns greetings from a number of well-known manufacturers, hopeful and friendly greetings. Come, then: stir up, let us begin the good times.

LOOKING FORWARD—1927**By W. J. U. WOOLCOCK, C.B.E.**

Too great a confidence in the future is apt to engender a neglectful attitude to those essential details, attention to which is so necessary if industry is to progress; whereas the greater our hope for the future, the more intense become our efforts to advancement. It is, therefore, unnecessary at the commencement of another year to magnify unduly the events of the past year which have so daunted our assurance, or to regret that we have lost a great part of the confidence with which we faced the future a year ago. In the face of such a recollection it becomes all the more necessary to join in what has become a widespread attitude of hope in the year ahead, and in the case of chemical industry there is little difficulty in visualising the materialisation of our hopes if we give the events of the past twelve months their correct significance.

It must be remembered that, unlike rival countries, England is not prone to produce spectacular evidence of progress and much of the advance that has been made recently has been too little advertised at its inception. In these post-war days when the justifiable assurance of the earlier part of the century has had to give way to very tentative expectations of success, it is especially necessary to prove publicly the hvelness of a rapidly changing industry. We in England are too prone to keep our information to ourselves. Perhaps, however, there is a better realisation of the position of British chemical industry in other countries for within the past few weeks there have been published articles in the foreign press pointing, among other things, to the superiority of British fine chemicals and to the progressive trend towards technical development in the dye industry. In the case of the latter improvement in organisation is obvious. Greater facilities are being offered for rendering technical service to dye consumers; manufacturers are endeavouring to make their technical services as effective as those of their foreign competitors, and research is taking the place which is its right in an undertaking which has to meet keen competition in world markets. The enterprise of dyestuffs manufacturers was amply displayed and ultimately justified in the attempts made to produce novel colours for artificial silk (cellulose acetate) dyeing; and the careful observer can see many other signs of progress during the year. In spite of adverse influences imports of finished dyes show only slight changes from those of last year when compared with the variations during the past few years.

• In the case of the sister industry of fine chemical production there seems little doubt that progress will follow at the remarkable pace which has already been set. Little affected by the coal strike, this industry will find no difficulty in expansion both within and without the scope of the amended List II. Already there is a brighter outlook in this section of chemical industry, and on a reputation which is becoming increasingly recognised there will be based a policy of continued progress in this younger British industry.

In another expanding industry, that of synthetic nitrogen manufacture, the enterprise in the British concern leaves little room for doubt as to the progress which will continue to be made during 1927. Hampered as we are by a lack of natural power supplies, our research

workers, far from being dismayed, are giving increased attention to plant technique, which concentration is placing British processes well in the front line of modern methods, and the progressive policy in the industry has been as certainly though not as prominently displayed as in the case of the Continental concerns.

In the manufacture of commercial solvents which has become of such imposing significance during the past year or two it is particularly gratifying to find that English manufacturers have not been behindhand, and while production of some of the higher alcohols at low prices is already an established industry, research in the field of synthetic methanol and ethanol production is well on the way to a satisfactory culmination.

The older established industries heavy chemical manufactures for instance have undoubtedly passed through a very acute period of their history, and the derangement which was caused by the coal stoppage will not be overcome immediately. On the other hand, the fact that the disturbances were far from resulting in disaster is a matter for some considerable congratulation, and is a recollection on which we can base a firm hope for their future prosperity. Neither must we overlook the immense help that will be gained from association with the new combine in the case of member firms; and for all heavy chemical manufacturers in England there will be an indirect influence, in that international trade will be facilitated by the presence of the combine in foreign markets.

In the light of these reflections, it becomes impossible to take up any but an optimistic attitude towards the prospects in chemical industry during the coming year. After the surprises of 1926, we cannot pretend to affirm that the New Year will be undisturbed by unexpected influences; and without any ideas as to the shape that such factors may take, it is impossible to prepare ourselves for particular crises. But this cannot prevent us from proceeding with the work of recuperation, or from following the lines of investigation which are continually being opened up before us. Certainly British chemical industrialists are becoming more alert to the fact that the greatest factor in modern development is the amount of scope given to the researcher, whether it be in the laboratory, the design office, or the engineering shop, and this alone is ample justification for our taking the most hopeful view of the future.

THE HEAVY CHEMICAL AND ALLIED INDUSTRIES IN 1926**By REX FURNESS**

The record of British trade during 1926 is depressing indeed. The export and import figures show decreases of £105,132,639 and £59,013,963 respectively when compared with the 1925 figures, the December figures being excluded in each case. At the same time, the chemist—mayhap somewhat selfishly—is able to extract the proverbial crumb of comfort from the fact that the chemical industries have suffered less than any other major industry. In fact, the 11 months' figures for the years 1926 and 1925 show that imports of chemicals, drugs, dyes and colours have increased by only £1,000,000, whilst exports have decreased by £1,600,000. It has demanded no little courage, optimism and thought to carry on in the difficult conditions which have ruled

during more than half the year, but it is satisfactory to realise that essential products have been made available to industry in general, and that the export trade has been reasonably well maintained. Indeed, in certain instances, such as soap, glycerin and caustic soda, our export trade has increased. May we not hope that the spirit of optimism which has carried the industry through the dark days shall continue, and, with the aid of the good relationships which have long existed between employer and employee, and to which the record of the past year is due in considerable degree, find justification in a year of prosperity during 1927.

The most important commercial development of the year is, of course, the formation of Imperial Chemical Industries, Ltd., by the combination of Brunner, Mond & Co., Ltd., the United Alkali Co., Ltd., Nobel Industries, Ltd., and the British Dyestuffs Corporation, Ltd., into one great alliance. In international chemical relationships the British industry will be able to command a greater respect and attention in the future, whilst at home both general industry and the chemical industries will benefit by the economies which will materialise in due course. With the general financial re-arrangements and the possible executive and administrative economies which may result we shall not deal at this juncture although these are matters which the chemist neither places nor wishes to place without his consideration—but we may venture to reply to one criticism which has been somewhat widely made. The elimination of competition and the creation of a monopoly often leads to stagnation and self-satisfied ease, it is true, but the vitalising power of comprehensive research is sufficient to ensure true progress. The research records of the companies constituting Imperial Chemical Industries, Ltd., and of the individual members of the new Board of Directors, are worthy of the best traditions of British chemistry and chemical industry. To illustrate briefly, Brunner Mond recently developed synthetic ammonia production, the United Alkali Co. kept the Leblanc process in active competition with cheaper methods of alkali production by reason of the attention given to the winning of valuable by-products, Nobel Industries have recently placed pyroxylin lacquers upon the market, and are showing potential users how to master the technique of their application, and the British Dyestuffs Corporation has been very active in the production of new dyestuffs for special purposes, and of a range of organic chemicals not directly associated with the dyeing of textiles. Altogether it is difficult to believe that anything but good can come to British and Empire trade and industry as a result of the formation of Imperial Chemical Industries, Ltd.

The formation of Nitram, Ltd., by the British Sulphate of Ammonia Federation is another event of importance. The new company will market, in addition to ammonium sulphate, the newer nitrogenous fertilisers as well as composite manures. With the growing appreciation on the part of the farmer of the economic return from the use of complete manures, it is important that too narrow a commercial outlook be absent from a great sales organisation, and Nitram, Ltd., should be welcomed by all producers of fertilisers.

Synthetic nitrogenous fertilisers now form almost one-half of the world's consumption of nitrogenous

manures, so that the continued progress of Synthetic Ammonia and Nitrates, Ltd., at Billingham, is very gratifying. Further, the intensive experience in the conduct of reactions at high temperatures and pressures which has been gained makes many momentous developments probable. It should not come as a great surprise if the announcement were made that this company is to market synthetic methyl alcohol. It is already known that Brunner Mond—the parent company—is amongst those who are keenly and actively interested in the hydrogenation of coal by the Bergius method—a process which has been worked for some time upon a large experimental scale in Germany, and which, according to Bergius himself, has been proved to be financially sound. The production of synthetic methyl alcohol and liquid hydrocarbons in quantity, and the winning of large amounts of low boiling hydrocarbons from coal by direct hydrogenation or by one or more of the processes of low-temperature carbonisation of coal, which have received much attention during the year, may not materialize at once, but the present and prospective progress along these lines is enough to assure us that the British chemical industry will not be found wanting if and when the supply of “natural” motor fuels fails.

The trade in alkalis during the year has suffered somewhat in certain directions. Thus, the diminishing exports of soda ash, soda crystals, and soda bicarbonate from 1924 to 1925, when about 6,000,000 cwt. and 5,500,000 cwt. were exported, have continued during 1926. Up to the end of October there were exported only 3,950,553 cwt., as against 4,795,036 cwt. during the first ten months of 1925. The one satisfactory feature in these matters is the maintenance of the Empire demand. The trade in caustic soda, however, has a better aspect, for an increase in exports during the first ten months of 1926 is to be recorded, the figures being 1,480,291 cwt. against 1,417,670 cwt.

It is, perhaps, characteristic of the vitality of the alkali industry that Brunner, Mond & Co. have this year spent £100,000 upon new laboratories wherein work in connexion with the ammonia soda process will be conducted. It is a happy omen for the success of the new combine and for British chemical industry in general that such a gesture be made, indicating a conviction on the part of those in control that progress is not yet at an end, even in such a well-established and highly developed process.

Acid production has suffered considerably during the year under review, and the fact that the sulphuric acid plants of this country have been worked at about one-third of full capacity is unfortunately broadly illustrative of the position, and it can scarcely be hoped that the present justifiably high prices will be substantially reduced as yet. The effect of this upon sulphate of ammonia producers using by-product ammonia, and upon superphosphate manufacturers, already very greatly harassed, is severe.

The home trade in alkalis may be expected to increase with the commencement of manufacture on the part of several makers of artificial silk. Many of the companies formed during the boom period last year are commencing active production. The Kirklees Artificial Silk Company is producing viscose silk at Tottington,

Lancs., and at Gloucester. The Aintree works of British Enka, Ltd., have commenced production, and will proceed to full scale operations gradually—that is, to the manufacture of 20,000 lbs. of viscose per day. The Rayon Manufacturing Co. and the Western Viscose Co. are beginning production of the artificial fibre, whilst nitrocellulose and viscose are being made at Stowmarket by the Bulmer Rayon Co., which is hoping eventually to turn out 8,000 lb. per week of the former type of fibre and 60,000 lb. per week of the latter. Courtaulds, whose greatly-increased activities are well known both in this country and abroad, are reported to be about to produce acetate silk, in addition to their well-established viscose silk. Advances in production, dyeing and marketing are to be recorded in connexion with Celanese acetate silk.

A word must be given regarding the possibilities of artificial wool. The best known type, produced in a manner very broadly similar to that of artificial silk manufacture by the viscose process, is probably that of Snia Viscosa, the important Italian firm, but other types are being pressed forward. Claim and counter have been made, but the so-called artificial wool has probably a future, possibly not in competition with natural wool, but in conjunction therewith for obtaining special effects in the finished goods. Similarly, immunised cotton obtained with the aid of *p*-toluene sulphochloride has many special properties, including its affinity for basic dyestuffs and its dyeing characteristics (resembling those of cellulose acetate in marked degree), whilst the material is more resistant to alkalis than the cellulose ester products. The work of the chemist in the production of specially treated natural fibres such as immunised and amideised cotton and in the manufacture of "synthetic" fibres will place new materials in the hands of the textile manufacturer, and will enable many novel effects to be realised.

Although it cannot be said that there have been spectacular developments in the soap industry, it is very satisfactory to note that the quality of British soap stands as high as ever throughout the world, and that in a year, during a great portion of which work has been carried on under difficulties, exports have actually increased as compared with 1925. The export figures for the first ten months of the years 1926 and 1925 were respectively 1,298,971 cwt. and 1,233,295 cwt., whilst imports were slightly higher, as the figures 240,691 cwt. and 211,655 cwt. show.

The increase in demand for edible oils and fats has continued, so that refining methods in the soap industry have still claimed considerable attention, for the quality of British soaps must not suffer, and, initially, somewhat lower grade oils have had to be taken. There is no question of the success of such refining methods, as the evidence of the soaps themselves amply demonstrates. Hydrogenated oils have again not been so fully utilised as was at one time expected, not, however, due to any inherent inferiority when their properties and usage are thoroughly understood, but to economic reasons. The relatively slight difference in price between hard fats and soft oils makes hydrogenation uneconomical in many instances. The study of activity of catalyst, elimination of catalyst poisons from raw oils, the production of hydrogen, and kindred problems still proceeds,

and the hydrogenation process may represent more than an insurance against unwarranted rises in the prices of hard fats at no distant date.

The edible oils and fats industries have also carried on in a remarkable fashion, and a slightly greater export trade has been done during 1926 than 1925. Here again no radical development in process has occurred, but refining methods command constant attention, and treated bleaching earths and decolourising charcoals are constantly being offered, with accompanying claims of superiority which are sometimes justifiable.

A new continuous extraction plant has been described and demonstrated in which very small charges of seed are treated upon a counter-current principle with solvent. The rapidity of extraction is a prominent feature of the apparatus, but oil extractors have not been unanimous in accepting the small charge idea, either in this country or in America.

Glycerin has been much in demand during 1926, and a considerable increase in exports has to be recorded. Many substitutes have been offered in the past, especially during the war years, but none has won its way. To-day, however, the claims of ethylene glycol have to be considered, for it has been shown to nitrate well to a non-freezing explosive which may prove a valuable material either in combination with or in substitution of trinitroglycerin. Its physiological properties, too, fit it for many uses now served by glycerin. Methods for producing the glycol from the ethylene of oil gas *via* ethylene chlorhydrin are being developed, and glycerin producers may have to watch ethylene glycol carefully. The proof of the value of glycol ethers as pyroxylin solvents has been given during the year, and a possible demand may allow the production of glycol to be intensified, with consequent reductions in price.

The mention of pyroxylin solvents recalls the fact that motor-car body makers in this country are following the very definite American example of using pyroxylin lacquers in their finishing operations. Nobel Industries, Ltd., have come strongly into this market, and have built a large demonstration centre where the new lacquers are being exhibited and the art of their application taught to prospective users. The manufacture of suitable solvents—the higher alcohols etc. by fermentation processes—has been stimulated.

It may not be strictly correct to class beet sugar as a heavy chemical, but the progress of the industry, in which many chemical engineering methods are applied, merits consideration. The acreage under beet has almost doubled each year since 1924, and this season around 130,000 acres have been cultivated. The rise in yield per acre has also been noticeable, and to-day an average eight tons of beet is grown per acre. British sugar factories this season will produce about 120,000 to 130,000 tons of sugar. The location of the factories is not generally known, and it may be well to give a list of those operating this year as follows:—Cantley, Kelham, Colwick, Spalding, Ely, Ipswich, Kidderminster, Cupar, Felstead and Poppleton, Bury St. Edmunds, Wisington, Peterborough, and Greenock. The total share capital of these organisations is £2,925,507, and the total subsidy paid by H.M. Government up to November 6, 1926, was £2,085,010.

Much attention has been paid to types of extraction

process, refining methods, seed selection and cultivation, fertilisation of beet grounds and so forth, and the industry is making a bold bid to establish itself against the day when State help will come to an end.

The heavy chemical industry in this country is not yet faced with a chlorine problem so acutely as are those of other lands, and large amounts of the gas are used for making bleaching powder and liquors, either within or without chemical works proper, whilst other outlets are being developed. Textile works and paper mills take large quantities of bleach, and much bleaching powder is used now in petroleum products refining.

Paper-making is widely distributed, but consolidation and combination is not absent in this industry. Thus the most recent development of note concerns the Inveresk Paper Co., Ltd., which controls many paper works. Controlling interest in a large German paper and chemical works has been acquired. We have here, therefore, a large and scientifically-controlled paper organisation with supplies of raw materials assured. The use of silicate of soda in paper-making is advancing, and recently disclosed research reveals much of interest to the paper maker in this direction.

The portland cement industry is progressing along the lines of making ordinary cement in rapid hardening form by careful attention to proportioning and fine grinding of clinker. Such rapid hardening cements compete with the aluminous cements of French origin, which must be offered at prices considerably higher than that of portland cement. The plea for much greater practical interest in cement research may, however, be endorsed.

Research in glass technology has been maintained at a high level, and a passing word must be given to many high quality products of the industry, such as optical glass, British Pyrex, chemical glassware, etc., and to the newer Vita glass, the claims of which have been steadily advanced during the year. The valuable effects of ultra-violet radiation upon health are now established, and the property of Vita glass, which allows the rays to pass, is being proved in the results of many carefully controlled investigations with school children and others.

Coal-tar industries have naturally suffered during the year, but reference to the papers given at the Tar Products Exhibition makes it clear that the industry is still very much alive. Problems of low-temperature carbonisation of coal, pulverised coal firing of boilers, coal hydrogenation, gas purification, safety in mines, coal blending and cleaning, etc. do not lie within the scope of this review, but it is satisfactory to note that Britain need feel no shame in regard to her activities in general coal research.

The chemical engineer and plant manufacturer and the metallurgist have had much of interest to record during the year, and the special steels and alloys for use in plant required for specific resistance to chemicals etc. for high temperature-high pressure work as well as non-ferrous alloys and other materials of construction are receiving more and more attention.

Even with the shadow of 1926 still darkling upon us, let us repress any desire to assume the mantle of a Daniel and to interpret the handwriting on the wall into a warning of disaster. Let us rather join the band of hard-working optimists, and in a spirit of determination and hope look forward eagerly to 1927.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

SUPPLY OF JOURNAL TO MEMBERS

It has been arranged that all Members of the Society shall be supplied with the first four issues of the JOURNAL for January irrespective of whether their subscriptions for 1927 have been received or not. Those who have not yet remitted the amount to the Society's offices are recommended to do so as soon as possible in order to ensure that the issues subsequent to that for January 28 are despatched to them on publication.

LONDON SECTION

At meeting, held on January 3, Mr. C. S. Garland presiding, a paper entitled "Modern methods of sewage disposal," by Lieut.-Col. W. Butler, M.B., D.P.H., and Mr. J. H. Coste, F.I.C., F.Inst.P., was read by the latter author.

Mr. Coste first discussed the limitations of the process of sedimentation and showed that mere sedimentation in long channels would remove from 60% to more than 70% of the total suspended matter. If perfect sedimentation on a large scale were possible, however, the effluent would still be unfit for discharge into a river unless the flow of the river were many times greater than that of the effluent. Improved sedimentation could not yield sufficiently good material when a stable effluent was desired, i.e., one which would remain offensive. After considering sewage disposal by irrigation on land, the history of the intensive biological treatment of sewage was given, leading to the development of the activated sludge process by Fowler and his colleagues.

Types of plant for treatment with activated sludge were then dealt with, extensive experiments with both air-diffuser and mechanical agitation plants being described. Experiments made with roughly-sedimented sewage led to the conclusion that ordinary sedimented effluent was a more favourable liquid to treat than crude sewage, and it was found that greater volumes of sedimented sewage could be treated in the paddle (agitation) plant. Dealing with the re-aeration of returned activated sludge, it was found that separate re-aeration of the sludge after separation from the final effluent was a more satisfactory means of keeping it in active condition than that of allowing the whole liquid to remain longer in the treatment tanks.

The nature of activated sludge and experiments on its mode of action were then discussed. It was shown that oxidation plays a large part in the changes produced by activated sludge and figures were given indicating that although a mixture of activated sludge and sewage did not change in character during five hours in the absence of air, yet an immediate change had been effected, practically at the moment of mixing. The "immediate" action of activated sludge varied with the proportion of active material mixed with the sewage, though large proportions did not appear as efficient as smaller ones, probably because the action slowed down as the oxidisable matter in solution decreased in amount. The useful action of activated sludge was associated with the moist solid and not with the liquid portion. The paper concluded by giving the results of experiments

which suggested that the depth of tank had little effect on the results of treatment of activated sludge with diffusers.

An interesting discussion followed, in which questions relating to the disposal of sewage sludge were raised, contributions being made by the chairman, Dr. Calvert, Dr. Voelcker, Dr. Ormandy and several others.

OTTAWA SECTION

At the regular meeting held on December 16, Mr. A. E. MacRae presiding, it was agreed to hold the January meeting on the 19th instead of the 20th, as stated in the programme.

Dr. A. E. MacIntyre, in reviewing a few semi-popular books on chemistry, drew attention to the increasing desire of the man in the street for scientific information; he suggested that books catering to this demand would make ideal Christmas gifts.

Mr. D. W. Stewart, National Research Council, contributed a paper entitled "Some Metallurgical Problems." As a preliminary he ran through the actual ore-dressing operations of a particular mine in British Columbia which produces a lead zinc ore. The metals are practically completely separated by flotation processes. The problems which the speaker then took up embraced such things as, the difficulty of grinding to average run on account of the varying toughness of the ore, the enormous wear on pumps handling daily thousands of tons of material, corrosion problems arising from condensation on the outer surface of pipe lines, and filtering troubles. Selective flotation of either lead or zinc in the presence of one another is accomplished but offers trouble in control, and laboratory tests are most useful at this stage, and are also used for checking the mine flow.

Discussion of this paper, in which many took part, centered largely on details of flotation processes, and was contributed to from first-hand knowledge by Messrs. W. B. Timm and C. S. Parsons.

CALENDAR OF FORTHCOMING EVENTS

- Jan. 10. INSTITUTE OF METALS, *Scottish Local Section*. 39, Elmbank Crescent, Glasgow, at 7.30 p.m. Discussion on "The value of research," by Prof. J. H. Andrew.
- Jan. 10. INSTITUTION OF THE RUBBER INDUSTRY, *London and District Section*. Engineers' Club, Coventry Street, W.1, at 8 p.m. "Ageing of raw and vulcanised rubber," by G. Martin.
- Jan. 10. CERAMIC SOCIETY. North Staffordshire Technical College, Stoke-on-Trent, at 7.30 p.m. "The chemistry of coal," by Prof. R. V. Wheeler.
- Jan. 11. INSTITUTION OF PETROLEUM TECHNOLOGISTS. Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m. "The conditions governing the occurrence of oil in Burma," by Dr. L. Dudley Stamp.
- Jan. 11. SOCIETY OF CHEMICAL INDUSTRY, *Birmingham and Midland Section*. University Buildings, Edmund Street, Birmingham, at 7.15 p.m. "A study of the rotary dispersion of certain derivatives of hydroxy-acids," by C. E. Wood.
- Jan. 11. INSTITUTE OF METALS, *North-East Coast Local Section*. Armstrong College, Newcastle-on-Tyne, at 7.30 p.m. "Some aspects of the corrosion of metals," by U. R. Evans.
- Jan. 11. INSTITUTE OF METALS, *Birmingham Local Section*. (Arranged by the Co-ordinating Committee.) Engineers' Club, Waterloo Street, Birmingham, at 7 p.m. "Forces set up in strip rolling," by H. S. Caswell.
- Jan. 11. SOCIETY OF CHEMICAL INDUSTRY, *South Wales Section*. Technical College, Cathays Park, Cardiff, at 7.30 p.m. "Magnesium and its alloys," by W. R. D. Jones.
- Jan. 11. INSTITUTE OF CHEMISTRY, *Manchester and District Section*. "Air pollution," by Prof. J. B. Cohen.
- Jan. 12. SOCIETY OF CHEMICAL INDUSTRY, *Nottingham Section*. With the co-operation of the Fuel Section. University College, Nottingham, at 7 p.m. "The production of liquid fuels from coal," by Dr. J. G. King.
- Jan. 13. INSTITUTE OF METALS, *London Local Section*. Rooms of the Society of Motor Manufacturers and Traders, Ltd., 83, Pall Mall, S.W.1, at 7.30 p.m. "Hardening," by W. Rosenham.
- Jan. 13. SOCIETY OF CHEMICAL INDUSTRY, *Manchester Section*. Joint meeting with the Manchester Section of the Institution of the Rubber Industry. 16, St. Mary's Parsonage, Manchester, at 7.30 p.m. "Rubber solvents," by Dr. D. F. Twiss.
- Jan. 13. OIL AND COLOUR CHEMISTS' ASSOCIATION. Rooms of the National Federation of Paint Manufacturers, 8, St. Martin's Place, Trafalgar Square, W.C.2, at 8 p.m. "Cadmium colours and their application to the paint industry," by H. W. D. Ward.
- Jan. 14. INSTITUTE OF METALS, *Sheffield Local Section*. The University, St. George's Square, Sheffield, at 7.30 p.m. "Gas furnaces and their heating," by P. Hopkinson.
- Jan. 14. SOCIETY OF CHEMICAL INDUSTRY, *Chemical Engineering Group*. Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. "Thermo-electric and resistance pyrometry in industry," by J. A. Hall.
- Jan. 20. SOCIETY OF CHEMICAL INDUSTRY AND INSTITUTE OF CHEMISTRY. *Edinburgh and East of Scotland Sections. Joint Meeting*. The Pharmaceutical Hall, 36, York Place, Edinburgh, at 7.30 p.m. "The importance of fuel research in the coal problem," by Dr. C. H. Lander.
- Jan. 21. SOCIETY OF CHEMICAL INDUSTRY, *Liverpool Section*. The University, Liverpool, at 6 p.m. "Some physico-chemical and bio-chemical aspects of malignant growths," by Prof. W. C. McC. Lewis.
- Jan. 21. SOCIETY OF CHEMICAL INDUSTRY AND INSTITUTE OF CHEMISTRY. *Glasgow and West of Scotland Sections*. Engineers' and Shipbuilders' Institute, 39, Elmbank Crescent, Glasgow, at 7 p.m. "The volatility and carbonisation of oils for cylinder lubrication," by J. W. Donaldson.
- Jan. 22. SOCIETY OF CHEMICAL INDUSTRY, *Birmingham and Midland Section*. Annual Dinner.
- Jan. 22. SOCIETY OF CHEMICAL INDUSTRY AND INSTITUTE OF CHEMISTRY. *Birmingham and Midland Sections*. Chemists' Dinner. The Queen's Hotel, Birmingham, at 7 p.m. The guests will include the President of the Institute of Chemistry, Prof. G. G. Henderson, and the President of the Society of Chemical Industry, Mr. F. H. Carr, C.B.E.

INSTITUTION OF CHEMICAL ENGINEERS

The fifth annual corporate meeting of the Institution will be held in London on Friday, March 11, 1927, instead of in July. The programme of the Conference on March 9, 10 and 11 is arranged provisionally as follows:

Wednesday, March 9: Papers on "Lead-burning," by W. S. Freeman, and "Lead as a constructional material in chemical engineering," by S. J. Tunney. Papers on "Modern methods of sulphuric acid manufacture," by Dr. H. J. Bush, A. Grounds, B.Sc., W. G. Mills, W. A. S. Calder and J. Fox.

Thursday, March 10: Works visit. Paper on "Rubber in chemical engineering," by B. D. Porritt, M.Sc. Paper on "Effect of heat on strength of materials," by Prof. F. C. Lea.

Friday, March 11: Fifth Annual Corporate Meeting—President's Address. Paper on "The cracking of oils," by F. H. Rogers. Annual Dinner.

SOCIETY OF GLASS TECHNOLOGY

The President, Mr. Walter Butterworth, Senr., M.A., presided at a meeting held in University College, London, on December 15, 1926. Five papers were presented.

"Further note on sillimanite as a glass works refractory" by Prof. W. E. S. Turner, D.Sc. A pot ring made from a mixture of 5 parts of fine, 1 part of medium, and $\frac{1}{2}$ part of coarse sillimanite, with 3 parts of ball clay, was broken in use after doing service for ten weeks in a pot melting a potash-lead oxide silica glass. The ring showed little sign of attack by the glass. A sillimanite pot, holding 30 lb. of glass, had been in use, in the Department of Glass Technology at Sheffield, for melting a series of soda-ferric oxide silica glasses. The pot stood up well under this work, exhibiting no signs of honey-combing. This result was rather remarkable, since sillimanite usually offered little resistance to the attack of ash rich in iron compounds. An illustration was given to show the great resistance offered by sillimanite to changes in temperature.

"Some corrosion and erosion phenomena and their bearing on the macrostructure of refractories," by J. F. Hyslop, R. Gumm, and H. Biggs. The importance of the macrostructure of refractories was emphasised in connection with corrosion and erosion phenomena. The use of an indirect method, such as that employed, indicated that the characteristics and grading of grog were factors of considerable moment. Data were given which showed that the disintegration in a solvent of a composite material, such as wax loaded with burnt clay particles, depended on (a) the density of the solute-rich layer relative to the solvent, and (b) the size of the particles. If a light upward flowing layer was formed the material with large particles would be more rapidly broken up than that containing small particles. The reverse holds if a dense downward flowing layer is formed, the finer the particles the more rapid being the corrosion. Laboratory experiments on clay rods immersed in chosen glasses confirmed the above statements in respect to the corrosion of clay by glass. In a lead glass the clay with the larger grog was more corroded than that with the finer, but in a soda-lime glass the finer material was the more attacked. Consistent with safety in other direc-

tions, the evidence indicated that a refractory meant to withstand corrosion by a lead glass should contain as large a fraction of fine grog as possible, whereas one for use with a soda lime glass, say, should contain the maximum of large grog. It was also shown that where erosion was the principle factor in the break-up of the refractory, the conditions demanded different characteristics in the grog in that the material must hold the maximum of fine particles.

"A note on the X-ray patterns of mullite and sillimanite," by J. F. Hyslop and H. P. Rooksby. In two former notes it was stated that sillimanite and mullite gave X-ray patterns which could be distinguished, and the object of this further note was to record the data which had been obtained for several alumina-silica materials. It was concluded that there were, on close inspection, real and consistent differences between the patterns of sillimanite and of the crystalline substance formed in the samples examined. Further, these differences, although small, had been found sufficient for identification, since they depended upon the relative spacing of the lines, and not on differences in intensity which could be caused by preferential orientation of the crystals.

"Note on the design of parison moulds," by Dr. S. English. Of the three moulds, the ring, parison and blow moulds, ordinarily used in the making of bottles by machines, the parison mould was by far the most difficult to design properly. There was only one feature of a parison mould that could be determined even approximately by a study of the finished bottle it was desired to reproduce, and that was its internal size or glass-holding capacity: but even in this respect allowance had to be made for the preliminary blow up, which varied from one machine to another and from one type of bottle to another. For the purpose of parison mould calculations it was convenient to use the volume occupied by 1 oz. of hot glass. Assuming that 1 oz. of glass at 1250° C. occupied 0.75 cb. in., a gob of glass to form a 24-oz. bottle should have a volume of 18 cb. in. In regard to the shape of parison moulds, the only feature which was recognised as essential was the absence of sharp corners. The inner surfaces should always be continuous smooth curves.

The primary function of parison moulds was to give a preliminary shaping to a quantity of glass, and the moulds could only do this efficiently by cooling the glass surface in contact with the mould. It had been found that a heavy-walled mould always kept cooler than a light-walled mould under similar conditions. The thicker mould required less external cooling and retained its good condition longer than the thinner one, but it was much heavier, and in the case of a charge of moulds it heated up to the proper working temperature so slowly that a considerable loss of output was entailed. Cast iron appeared to be perfectly satisfactory as a parison mould material. It was suggested that stainless steel might be tried for the purpose.

The fifth paper was presented by Mr. V. H. Stott, M.Sc., and was entitled "The viscous properties of glass." Owing to lack of time, the reading of the paper on "The effect of cullet on the melting of glass," by Prof. W. E. S. Turner, D.Sc., was postponed.

PERSONAL AND OTHER ITEMS

We are glad to learn from the New Year Honours List that Sir Charles Greenway, chairman of the Anglo-Persian Oil Co., Ltd., becomes a Baronet, as does Sir John Scott Hindley, commercial adviser to the Mines Department. The new Knights include Mr. H. Spencer Morris, K.C. (president of the Industrial Court), and Mr. D. Milne Watson, governor of the Gas Light & Coke Co.

Major Charles Arthur Mander, of the firm of Mander Bros., paint and colour manufacturers of Wolverhampton, has been appointed a deputy lieutenant for Staffordshire.

Mr. E. Matthews, M.Sc., has been appointed demonstrator in the Chemistry Department of Guy's Hospital Medical School.

Mr. R. K. S. Mitchell has been awarded the degree of D.Sc. of Edinburgh University for a thesis on "Some β -octyl esters of substituted acetic acid."

Mr. John Baddeley, the Secretary of Mines, and Minister of Labour in the New South Wales Cabinet, accompanied by a mining expert, is to visit America and Europe to study the saving of coal, the treatment of coal for the recovery of its by-products, road construction, and various industrial matters.

The Council of the Institute of Chemistry has sanctioned the formation of a local section for the Dominion of New Zealand. Prof. T. H. Easterfield is the chairman of the new section.

A new research laboratory for physical and inorganic chemistry, the gift of Mr. and Mrs. H. Cohen, has been opened at East London College in the department of Prof. J. R. Partington. The laboratory is equipped for research in physical and inorganic chemistry and chemical microscopy and includes a small library.

The *Chemiker-Zeitung* has celebrated the fiftieth anniversary of its foundation by the issue, on December 29 last, of a special number containing congratulatory messages from prominent personalities in the chemical world.

New Year's Prospects for Chemicals

In a New Year message to the British Industries Fair number of the *Advertising World*, Mr. W. J. U. Woolcock, C.B.E., General Manager, the Association of British Chemical Manufacturers, writes:—

"The prospects for the British chemical industry in 1927 are distinctly good. Probably no other industry has suffered less as a result of the coal dispute. Therefore recovery in the new year is likely to be at least as rapid as, and probably more rapid than in any other industry. The chemical exhibits in the British Industries Fair will show how every firm is extending its range of goods and that very considerable progress has been made in the last year, particularly in regard to fine chemicals. So far, chemical products, apart from those like soap, have not been widely advertised because their appeal is not to the general public but to the trade buyer. The Fair brings the manufacturer into direct touch with him. It is of immense propaganda value also in emphasising the importance of the application of science to industry. If we are to maintain our industries against world competition, science, which

finds its greatest application in this industry, must permeate every industry to a like extent.

"Despite the fact that the recent great chemical 'merger' did not take place until after all space had been booked in the chemical section of the Fair, Imperial Chemical Industries, Ltd., is to exhibit, arrangements having been made to take over the centre space reserved for one of the constituent companies. This, of course, will be the new company's first exhibit and will include heavy chemicals, dyestuffs and intermediates."

Peace Industrial and International

The Annual Dinner of Messrs. Arthur Duckham (1920), Ltd., was held at the Trocadero Restaurant on December 23. The Chairman of the Company, Sir Arthur Duckham, K.C.B., presided. There were present over 180 members of the staff of the company.

After proposing Loyal Toasts, Sir Arthur said that there was one further toast which he would like to give the Company, namely, "Peace—International and Industrial." He felt that the prosperity of the country, and indeed, the Company, collectively and individually, depended upon the general acceptance of international peace and peace in industry. Subsequently, Sir Arthur took the opportunity of congratulating the staff of the Company in having brought to commercial success a number of important developments upon which they had been engaged during the past few years.

Canadian Mineral Industry in 1926

The preliminary estimate of the Dominion Bureau of Statistics places the output of the Canadian mineral industries for 1926 at \$242,886,000, which is 7.1% above the previous year and \$16,000,000 above the previous highest year—1920. The output of non-metallic minerals, excluding coal, increased 10% to \$24,841,000, and that of coal by 3,000,000 tons to 16,000,000 tons, with a total value of \$58,000,000, which is 18% above the value of last year's output. The production of metals rose by \$2,500,000 to \$119,881,000. Gold production remained practically stationary at 1,729,377 fine ounces, silver rose by 1,500,000 fine ounces to 21,907,000, nickel fell by 6,250,000 lb. to 67,551,000 lb., copper rose by 28,000,000 lb. to 139,000,000 lb., lead rose by 28,000,000 lb. to 281,000,000 lb., and zinc rose by 38,000,000 lb. to 148,000,000 lb.

Pollution of Rivers

Lord Balfour, on behalf of the Prime Minister, will shortly receive a deputation organised by the British Waterworks Association and the Salmon and Trout Association, with the object of persuading the Government to set up a central authority to deal with the question of rivers pollution and to organise research on the best methods of dealing with harmful trade effluents.

Beit Fellowships for Scientific Research

The fourteenth election of Beit Fellows will be held on or about July 15, 1927. Applications for the three Fellowships which may be awarded must be received on or before April 19. All information may be obtained, by letter only, from the Rector, Imperial College, South Kensington, London, S.W. Sufficient additional funds having been provided, the three Fellowships awarded in 1926-27 were given for two years, subject,

in regard to the second year, to a favourable report on the research; and it is probable that similar action may be taken in respect of future awards. The annual value of a Beit Fellowship is £250.

Element 61

At a recent meeting of the Società Italiana per il Progresso delle Scienze, Prof. Rolla gave further information about the independent isolation by Rolla and Fernandes of element 61. The new element was obtained (in the concentration of 0.5%) by repeated fractional crystallisation of didymium earth. The absorption spectrum of the material shows interesting peculiarities. A full account of the work, which dates from 1922, is given in the *Gazzetta Chimica Italiana* for September.

Report on the Nitrate Industry

The annual report on the nitrate industry issued by Messrs. Aikman (London) states that during the year under review the chief feature in the market for nitrogenous fertilisers has been the large increase in the production of synthetic nitrogen and the improvement in the condition in which many of these products have been marketed. This has placed the Chilean nitrate industry in a very critical position, and would remain so unless steps were taken by the Chilean Government to cancel the export duty, so that a large reduction could be made in the selling price. Two years ago a reduction in the export duty would have sufficed, but now nothing short of the abolition of the duty could save the industry. During the coming year a considerable increase in the production of synthetic nitrogen products was anticipated, especially in Germany, where two large combines have recently been formed to erect important plants under new processes of production. It would appear, therefore, that a nitrogen price war was fast approaching. Chilean nitrate was still generally recognised as the best nitrogenous fertiliser, being free from all the disadvantages of manufactured chemical manures, and there was every reason to believe that if it could again be marketed at a competitive price consumers all over the world would return to its use. To achieve this object the price should be £1 10s. to £2 per ton lower, based on present prices of synthetic nitrogen fertilisers, or £3 10s. to £1 per ton lower if the latter are subject to a further cut of £2 per ton next season. Sales by the Producers' Association for delivery during the nitrate year which commenced July 1, 1926, amount to only 575,000 tons, compared with 1,415,000 tons sold at this date last year.

The Reported Transmutation of Mercury into Gold

In the News Edition of "Industrial and Engineering Chemistry" (December 10, 1926), Messrs. H. H. Sheldon and R. S. Estey describe an investigation into the process by which Dr. A. Miethe claimed to have transmuted mercury into gold. After several months' work, the authors have been unable to produce a detectable amount of gold, either by using apparatus identical with that used by Miethe or using quartz burners of their own design.

The Conversion of Hydrogen into Helium

In a recent article (*Chem.-Z.*, No. 110, 905) Dr. H. Herbst discusses the claim of Prof. Paneth to have converted hydrogen into helium (cf. *CHEM. & IND.*,

December 3, 1926). Dr. Herbst draws attention to the capacity of palladium for the adsorption of hydrogen and as well as of helium, and suggests that any preparation of palladium will contain a certain quantity of helium derived from the atmosphere. It would therefore be of interest to examine whether the conversion takes place when other catalysts are used, and particularly when use is made of a pure preparation of palladium which has previously been treated with hydrogen (to drive out any helium) and heated in a high vacuum.

Purification of Helium

Completion of a helium gas purification unit mounted on a railroad car at Scott Field, Belleville, Ill., the lighter-than-air instruction centre of the U.S. Army, has been announced by Major-General Mason M. Patrick, chief of the U.S. Army Air-Corps. A great reduction in the cost of purifying helium is expected to result by the use of such a unit. It is estimated that the cost of purification with the new unit will be about \$1.50 per 1,000 cb. ft., as compared with \$12.26 per 1,000 cb. ft. necessary for freight charges alone from Scott Field to Lakehurst, N.J., the only point where impure helium has been treated hitherto.

International Rubber Exhibition

The Seventh International Rubber Exhibition, which will be held in the Grand Palais, Paris, from January 21 to February 6, 1927, will be opened on Friday, January 21, by M. Léon Perrier, Minister for the Colonies. On the day following, a formal visit will be paid by the President of the Republic and by the Lord Mayor of London. The Director-General of the Exhibition, which deals not only with rubber, but with other tropical products and their related industries, is Mr. H. Greville Montgomery.

Tar as a Fuel.

A Diesel engine of the usual type, driving two dynamos, has now been run successfully for over a year, with lignite tar as fuel, by the Berliner Maschinenbau A.-G. The tar (m.pt. 40–50°) was kept liquid by a jacket fed with the cooling water, and paraffin was used to start the engine. The average consumption during the year was 350 g. per kw.-hr., or 260 g. tar and 90 g. paraffin.

German Dye Trade

Exports from Germany of dyes and colours of all kinds from January to August, 1926, amounted to 958,962 metric quintals, compared with 1,253,584 m.q. for the year 1925, 926,849 m.q. for 1924, and 2,176,969 for 1913. These figures show an increase during the first eight months in 1926 of about 15% over the figures for 1925. The exports to Great Britain amounted to 352,080 m.q. in 1913, and 117,254 m.q. in 1925, whilst during the first eight months of 1926, 70,998 m.q. were exported. The United States took 227,530 m.q. in 1913, 32,767 m.q. in 1925, and 20,920 m.q. in the first eight months of 1926. Germany's largest customer is Holland, and China retains the second place, which she occupied before the war. The United Kingdom is now third instead of first, and the United States has been overtaken by British India, Sweden, Russia, and are closely followed by Japan, which took in 1926 (six months) already more than the quantity imported from Germany during the whole of the previous year.

REVIEWS

THE HYDROUS OXIDES. By H. B. WEISER. Pp. x + 452. London: The McGraw-Hill Publishing Co., Ltd., 1926. Price 25s.

The critical re-statement of chemical facts in the light of advancing knowledge is often long delayed, as it is much simpler to copy the conclusions of earlier workers than to verify them. This is particularly true of the study of the hydroxides of the metals, as the fundamental researches of Van Bemmelen have not hitherto received the attention they deserve. It is, moreover, essential that the author of a book of this type should have practical acquaintance with the problems he is discussing, and in this respect Prof. Weiser is amply qualified, though his own work is introduced with commendable unobtrusiveness.

The term "hydrus" is used advisedly to indicate a general and variable attachment of water to the oxides, the word "hydroxide" being reserved for definite chemical compounds. This distinction is the more necessary as it is shown that very many of the hydroxides described in the older literature owe their apparently constant composition to the accidents of a particular method of preparation or of drying. The bulk of this monograph is naturally devoted to a systematic description of the gelatinous hydroxides, related ones being dealt with together and the space devoted to the various substances being varied according to their importance and the information at present available. There are ample references both to old and new work, though the reader is not confused by an attempt to include all the possible nineteenth century papers. An introductory chapter on the general properties of jellies gives an unusually impartial account of the many theories of gel structure. The last hundred pages are devoted to a discussion of practical applications of the hydrus oxides and related compounds, and in this space interesting accounts of the processes of tanning and water purification, and of the chemistry of mordants, cements and the soil are included. The book is, indeed, a useful and readable addition to the literature of inorganic and colloid chemistry.

P. C. L. THORNE

STARCH-MAKING AND THE MANUFACTURE OF DEXTRIN. STARCH SUGAR, SYRUP AND SUGAR COLOURING. By FELIX REHWALD, translated from the fifth revised German edition by CHAS. SALTER. Pp. viii + 264. London: Scott, Greenwood & Son, 1926. Price 12s. 6d.

It is fifteen years since the fourth (German) edition of this work was published, and the present edition is the first to be translated into English.

Processes in the starch and allied industries have not undergone much alteration on the chemical side recently, but numerous improvements in machinery have been made, and these improvements are fully illustrated and described in the present work, which is mainly devoted to the manufacture of starch from potatoes, wheat, maize and rice, and of the more important starch products. The descriptions of the various processes are clear and concise, and the book should be very useful to those engaged in the industries concerned. Too much space,

however, is given to the manufacture of wheat starch by the fermentation method; this method is obsolescent if not obsolete, and part of the space devoted to it might have been given with advantage to a fuller account of more recent processes. Methods of preparation of the less important starches are briefly described.

In the chapter on the properties of starch (Ch. II) the short account of the nature of the starch molecule (or should it be "molecules"?) is marred by several errors, and the enormous amount of work that has been done in the past few years on the constitution of starch remains practically unnoticed.

Mr. Salter has performed the task of translation very well on the whole, the text being very free from errors, although such a slip as "such starch manufacturers as go in for the removal of the germs," on p. 161, is almost inexcusable. Our literature on the starch industry is rather scanty, and the present work should be a welcome addition to it.

LEWIS EYXON

A TEXT-BOOK OF INORGANIC CHEMISTRY. Edited by J. NEWTON FRIEND, D.Sc., Ph.D. Vol. VII, Part III: CHROMIUM AND ITS CONGENERS. By R. H. VALLANCE, M.Sc., and A. A. ELDRIDGE, B.Sc. Pp. xxvi + 380. London: Charles Griffin & Co., Ltd., 1926. Price 18s.

This volume deals with the four elements chromium, molybdenum, tungsten and uranium. Each element is discussed under the headings of occurrence, history, preparation, physical and chemical properties and uses, followed by the preparation and properties of its compounds and the methods for its detection and estimation. Copious references are given to the original works from which the data have been obtained, and in this respect the book maintains the high standard set by the previous volumes in this series. As a painstaking compilation of the compounds at present known to exist, coupled with the excellent references to the original literature, the volume is of value both to the student and to the technical and research chemist.

The book deals only briefly with manufacturing details, but it is to be regretted that so little care has been taken to state these few details correctly. The authors, in making their abstracts from the several sources, have frequently confused one process with another. For example, the description of the preparation of tungsten from the ore commences by stating that scheelite is to be preferred as a source of tungsten, but the description which follows of the preparation of tungstic acid from the ore is, in reality, one for the treatment of wolframite, and not, as the student would assume, for scheelite. The outline of the manufacture of sodium chromate could not be more muddled than it is. The process for the manufacture of this chemical has been well described in books on industrial chemistry and in the technical press, and the authors might at least have consulted one of these sources before completing their notes. The mention of the use of a 50% iron ore containing 3% of chromium as "a source of chromium" is very misleading. It is doubtful if an ore of this composition could be marketed in this country or elsewhere; it certainly is not marketable for its chromium content.

ALBERT R. LUCAS

PLANT PRODUCTS. By S. HOARE COLLINS, M.Sc., and G. REDINGTON, M.Sc. Second edition. Pp. xiii + 262. London: Baillière, Tindall & Cox, 1926. Price 10s. 6d.

This is a second edition of Mr. Collins' "Plant Products and Chemical Fertilisers," published in 1918. A good deal of new matter has been incorporated, particularly in the sections on soils and crops, and the discussion of economic and labour questions in the older edition has been deleted since it had special reference to war-time conditions. The general plan of the book is, however, unchanged. Artificial fertilisers and organic manures are first dealt with: reference is made here to the important changes in the composition and solubility of basic slag due to the general adoption of the open-hearth process of steel manufacture, and some recent work on problems connected with farmyard manure is noted. Three chapters are devoted to soils, soil improvers (lime etc.), and soil reclamation: and this is followed by the section on crops, which includes an account of photosynthesis and chapters on the production of carbohydrates, oils, nitrogenous compounds, and other substances by plants. The final part deals with the use of plant products as food for the production of meat and milk.

The subject matter thus includes almost the whole of agricultural chemistry as it is usually understood. This is a very large field to cover in a volume of 250 pages, and a high degree of condensation is necessarily imposed. It says much for the method of presentation that the authors have produced an interesting and readable book, forming a useful survey of the whole subject, and demonstrating particularly the close interrelation of agriculture and other industries. The inclusion of a greater number of more recent references in the bibliographies at the end of each chapter would have further increased its value. (C. T. G.)

THE SECRET TRADITION IN ALCHEMY: ITS DEVELOPMENT AND RECORDS. By A. E. WAITE. Pp. xxii + 415. London: Kegan Paul, Trench, Trubner & Co., Ltd., 1926. Price: 15s. net

Mr. A. E. Waite, the celebrated authority on occult literature and tradition, has in this book performed a real service to the history of chemistry. Largely owing to the influence of the "Suggestive Inquiry into the Hermetic Mystery," published in 1850 by Mary Anne South, afterwards Mrs. Atwood, a tendency has arisen in certain circles to maintain that practically the whole of alchemical literature does not in fact deal with chemistry and transmutation, but is symbolic in nature. The true subject matter, it has been maintained, is the soul and its progress along the Mystic Way. Mr. Waite's skilful and careful analysis of the evidence has, once and for all, exploded this myth, and chemists may well feel grateful to him for the labour he has spent on the task and the successful conclusion to which he has brought it. Incidentally, the book, which is admirably produced, contains much interesting information on alchemy and the alchemists which the author has gleaned from his life-long study of the literature. Any chemist who cares for the history of his subject will find it a worthy addition to his shelves.

E. J. HOLMYARD

REPORT: MINES

Fifth Annual Report of the Secretary for Mines for the year ended December 31, 1925, and the Annual Report of H.M. Chief Inspector of Mines for the same period, with a Statistical Appendix to both Reports. Mines Department. Pp. 212. H.M. Stationery Office, 1926. Price 6s. net.

This report, which marks the completion of the fifth year of the existence of the Mines Department, contains, in addition to the report of the Chief Inspector of Mines, a review of general subjects arising out of the regulation and inspection of mine and quarry working, and also deals with the conduct and encouragement of research and inquiry, the testing and approval of safety lamps and explosives, and the testing of samples of mine air and dust, and other subjects.

Part I is devoted to a review of the coal mining industry in 1925, of the operation of the National Wages Agreements, and of colliery developments and legislation. The quantity of coal raised in 1925 was lower than in any year since 1905, except in the abnormal war and post-war years 1918-21. Up to the middle of May between 5 and 5½ million tons a week were raised except in holiday seasons; but during August and September the weekly output declined by a million tons a week. Improvement, however, occurred towards the end of the year, accompanied by an increased output per unit of labour. Altogether 243.2 million tons of saleable coal were raised in 1925, or 23.9 million tons less than in 1924, 44.2 million tons less than in 1913, and 26.4 million tons less than the average annual output in 1909-13. The number of wage-earners on colliery books was 1,041,100 in August of the year, rising to 1,084,600 at the end of 1925, compared with 1,140,000 during 1924. A reduction is recorded in the accident rate at coal mines. During 1925 the number of persons killed was 1128, and of persons injured 177,347.

The output of minerals in the United Kingdom is shown in the appended table:—

	1925 Tons	1924 Tons
Coal	243,176,231	267,118,167
Iron ore and ironstone (total)	10,142,878	11,050,589
All other minerals—		
(1) Non-ferrous ores		
Tin ore, dressed (black tin)	4,032	3,547
Lead ore, dressed	15,578	14,294
Zinc ore, dressed	1,603	2,817
Tungsten ore, dressed	1	2
Uranium ore, dressed	114	20
Copper precipitate	148	192
Manganese ore	820	2,457
Chromite	448	1,043
(2) For chemical and allied industries		
Arsenic (white) and arsenic soot	2,545	3,207
Arsenical pyrites	—	296
Iron pyrites	5,288	5,589
Bog ore	4,701	3,200
Ochre, amber, etc.	11,224	10,469
Salt brine	1,810,581	2,027,450
Barytes and witherite:		
Not ground	36,338	40,126
Ground	12,345	13,841
Celestine (sulphate of strontium)	1,072	1,450
Gypsum	414,302	371,289
China clay	850,180	806,864
Micaceous clay	20,834	28,683
Potters' clay	206,828	225,951
China stone	57,379	54,703
Felspar	—	1,058
Felsic	86,127	35,908
Calc spar	12,807	9,808
Alum shale	—	1,709
Oil shale	2,464,829	2,857,108
Petroleum	383	312

	1925 Tons	1924 Tons
(3) Minerals used in iron and steel making and other smelting processes :		
Fluorspar	39,070	49,492
Ganister (including silica rock, silica stone, and silica sand used as refractories) ..	404,293	634,431
Moulding and pig-bed sand	679,659	648,840
Fireclay	2,240,529	2,189,348
(4) Minerals for building and road making and for all other purposes :		
Limestone	13,060,753	12,813,471
Chalk	5,035,350	4,402,600
Sandstone	2,888,741	2,531,017
Slate	305,763	287,705
Clay and shale	13,073,940	10,843,418
Chert, flint, etc.	134,688	148,279
Gravel and sand	3,741,901	2,922,485
Igneous rocks	8,185,856	7,432,806

Coal.—The average declared value of the coal exported declined from 23s. 5d. per ton f.o.b. in 1924 to 19s. 10d. per ton in 1925. The average price of coal at the pit for home consumption in December, 1924, was about 19s. 3d. per ton sold commercially. Subsequently the figure dropped to rather less than 16s. 6d. in the period August to November, 1925. In December of 1925 the corresponding figure was about 17s. per ton. The total quantity of coal exported in 1925 was 50.8 million tons, compared with 61.7 million tons in 1924, and 65.5 million tons the average annual export in 1909—13. Home consumption of coal amounted to 169.6 million tons in 1925, which was about 10 million tons less than in 1924 and 1920, but slightly greater than in 1923 and substantially more than in 1922.

Iron.—The output of pig iron for the year amounted to 6,236,200 tons with an average of 149 furnaces in blast, as compared with 7,307,400 tons in 1924 with 185 furnaces, and 10,260,300 tons with 338 furnaces in 1913. The steel output for 1925 was 7,397,300 tons, as against 8,201,200 in 1924, and 7,663,900 in 1913. Imports of iron and steel into this country in 1925 amounted to 2,721,003 tons as against 2,429,385 tons in 1924, and exports were 3,731,023 tons, compared with 3,851,435 tons in 1924. The number of persons employed in the mining and quarrying of iron ore and ironstone during the year 1925 averaged 12,819, compared with 15,167 in 1924, 23,369 in 1920, and 22,900 in 1913.

Tin. The production of dressed tin ore ("black tin") in Great Britain increased during the last half of the year under review, the figures for the four quarters being 990, 966, 1038, and 1038 tons respectively, making a total of 4032 tons as compared with 3547 tons in 1924, 4858 tons in 1920, and 8355 tons in 1913. The number of persons employed in the tin mining industry (including arsenic) at the end of each quarter of the year were 2626, 2655, 2720, and 2868 respectively.

Lead.—The output of dressed lead ore (80% metal) in Great Britain for 1925 totalled 15,578 tons. This is an increase of 9% on the previous year's production, but it is less than 65% of that of 1913.

Zinc.—There was a good demand for this metal in the United States and France, and the production of dressed zinc ore (46% metal) for the year 1925 was 1603 tons, a decrease of 31% on that for 1924. It is only 9% of the production for 1913. Production is practically limited to four mines, Nentsbury and Threlkeld in Cumberland, Great Laxey in the Isle of Man, and Mill Close in Derbyshire. The average number of persons employed in the lead and zinc mining industry during the year was 1540.

Minerals used in the chemical and allied industries.—The aggregate value of the minerals of this group obtained in 1925 was £4,175,000, and was £544,000 less than in 1924. The reduction in value occurred chiefly in oil shale, salt, arsenic, and barytes. The output of oil shale in 1925 was 2,464,829 tons, estimated to yield 49½ million tons of crude oil and 44,000 tons of sulphate of ammonium. This is 392,274 tons or 14% less than the output of oil shale in 1924. The number of persons employed during the year in the oil shale mining industry was 4395, as compared with 4390 in 1924. In addition, 2567 men were employed in 1925 in the works where the products are extracted from the shale.

Minerals used in iron and steel making and other smelting processes.—The outputs of limestone and dolomite for fluxing purposes and of ganister and silica rock in 1925 reflect the depressed condition of the iron and steel industry, and were 15% and 22% less, respectively, than in 1924.

Minerals used in building and road making and for all other purposes.—The total amount of limestone for all purposes in 1925 reached 13 million tons. Its chief uses were for lime and cement making, road making, and as a flux in blast furnaces, these three uses absorbing 85% of the total production.

Part III of the report deals with proceedings under Part I of the Mines (Working Facilities and Support) Act, 1923, Part IV with the washing and drying accommodation at mines, Part V with the health and safety in the mining and quarrying industries, and Part VI with the Annual Report of H.M. Chief Inspector of Mines. The whole report contains numerous tables and charts.

COMPANY NEWS

LOW TEMPERATURE CARBONISATION, LTD.

The ninth annual ordinary general meeting, held on January 2, was presided over by Sir Arthur Wheeler, Bart., chairman, who stated that the reorganised finances of the company (cf. CHEM. AND IND., Dec. 17, 1926, p. 962) had provided a new working capital of about £135,000, which, subject to certain claims, would be utilised for reconstructing the Barnsley works and for working capital. Until these works were in successful operation the Board had decided to take no remuneration. The new plant has been carefully designed and standardised by the company's consulting engineers and Mr. Charles Parker, the Parker process having been successfully proved for technical efficiency under the tests of the Fuel Research Board. The total cost of the new works, including erection, is estimated at £75,000, the plant including five batteries, one in reserve and four in work, totalling 160 retorts, with a combined carbonising capacity of 250 tons of coal per day, thus ensuring the continuous treatment of 200 tons daily. The contractors had undertaken to deliver the whole of the plant in good working order by the end of May next, and to deliver one battery of 32 retorts by the middle of March. It was expected that the company would be turning out between 400 and 500 tons of Coalite per week, with the other by-products, by the end of May. When the whole plant has been completed, apart from the continuous production of 1000 tons per week of a perfect

domestic fuel, the process will be able to show large profits from its production of fuel oil, motor spirit, sulphate of ammonia and rich gas, which latter it was anticipated would have an enormous influence upon the cost of the generation of electric power. Mr. W. H. Belreus, Mr. H. Langham-Reed, Mr. Francis R. Wade, and Mr. R. P. Wilson were re-elected directors.

BRITISH PLATINUM AND GOLD CORPORATION, LTD.

The ordinary general meeting was held on December 31, and was presided over by Mr. T. J. Ive (chairman and managing director). The accounts for the year to June 30 last showed a loss of £12,712, as against a loss of £31,000 for the previous year. Owing to the high floods of the Ologodo River in December, 1924, which burst the dam, operations were suspended for more than half a year, but from August, 1925, to June, 1926, No. 1 dredger recovered 2902 oz. platinum and 881 oz. gold, as against 1909 oz. and 634 oz. respectively, valued at £65,261, against £45,163. No. 2 dredger, operating on the Casajero property, recovered during 11 months 445 oz. platinum and 85 oz. gold, compared with 343 oz. and 105 oz. respectively, valued at £9785 against £8112. The No. 2 dredger has been out of commission for four months, and may be so for another three, entailing a loss of at least £20,000 to £30,000 of revenue. With both the dredgers in full swing, a return of 500 oz. of platinum per month might be expected, yielding an income of about £110,000 per annum. Owing to the abnormal drain on cash resources, the Board, with the approval of the shareholders, has created a 6% participating convertible debenture stock amounting to £50,000, of which £20,000 will be utilised to satisfy and pay off certain outstanding liabilities, the remaining £30,000 being offered by way of rights to the shareholders whose names appear on the register on December 16, 1926, in the proportion of £1 of debenture stock for every 20 or multiple of 20 shares held. The Hon. Lionel Guest, Major F. W. D. Gwynne, and Mr. Chantry Luchbald have consented to act as an advisory committee to the Board, and to examine the position and ascertain what improvements and economies might be advisable.

SULPHIDE CORPORATION, LTD.

The thirtieth annual ordinary general meeting was held on December 22, the Right Hon. the Earl of Kintore, K.T., G.C.M.G. (chairman), presiding. The profit of £192,034 for the year was more than three times last year's figure, and dividends were declared of 10% on the preference shares and 10% on the ordinary shares, a substantial sum being placed to reserves. It was expected that by June 30 next the company would be practically freed from the enormous yearly outlay involved by the fire in 1923. In addition to the Central ore, there was now a second source of supply from the Junction mine, estimated to contain 500,000 tons of ore, purchased in 1923 for £75,000. In addition to the 80,000 tons of crude ore raised during the past year from these two mines, 29,238 tons of slimes from the dump at Central mine and 5840 tons from the Broken Hill Proprietary Company's mill were treated. The percentage of metal recoveries in the milling operations and the grade of the lead and zinc concentrates produced were higher than in the previous year, the recoveries increasing

from 88.7% to 90.9% of the silver, 86.2% to 89.6% of the lead, and 91.2% to 92.7% of the zinc. The cost of production of the lead concentrates fell from £14 18s. 3d. a ton to £12 12s., and of zinc concentrates from 36s. 3d. a ton to 30s. 10d. It was anticipated that the price of silver during the coming year would show a substantial decline, the conditions in China being the chief cause of the fall in this metal. The acid plants at Cockle Creek produced 18,333 tons of Mono acid, compared with 15,822 tons in the previous year, of which 10,598 tons were utilised for the manufacture of superphosphate, and 7435 tons were sold. The hydrochloric acid plant produced 258 tons of acid, compared with 77 tons, and the production of superphosphate increased from 29,074 tons in the previous year to 34,833 tons, and it was anticipated that before long production and sales would reach the 40,000-ton capacity of the plant. An important feature of the work at Cockle Creek during the year was the commencement of the production on a large scale from the first unit of the new cement plant, the output amounting to 24,328 tons. The quality of the cement was good; it is quick setting, easily passes all Government tests, and has been favourably received by the trade, and from its rapid hardening will be of great service for road making and road repair. The second unit, which will also have a capacity of 30,000 tons, is expected to begin operations in March next. The coal strike stopped the production of spelter at the English works at Seaton Carew, which would otherwise have slightly exceeded the previous year's figure of 4955 tons.

BENN BROS., LTD.

An interim dividend has been declared of 6½%, less tax, payable on January 1, being the same as last year's interim.

INVERESK PAPER CO., LTD.

The fourth annual general meeting was held on December 23, Mr. William Harrison, LL.B. (chairman), presiding. After referring to the increase of capital from £350,000 to £1,200,000 made in October last (cf. CHEM. AND IND., November 12, 1926, p. 843), the chairman drew attention to the rumours in the Press reports of the sale of the company's German interests, and warned the shareholders against giving credence to unofficial statements. These German works were purchased at a very low figure compared with the real value, primarily with a view to safeguarding an assured supply of first-class sulphite pulp, and since then the company has received many offers to purchase at a large profit. But the company will not entertain any offer to sell their ordinary shares in the International Pulp Co., Ltd., unless the prospective purchasers make a binding offer to purchase the participating preference shares in the company as well. Another condition is that the Inveresk and its associated paper-making companies shall be assured of the supply of all the pulp they need from the Koenigsberg mills at English market prices ruling, for a period of at least ten years. Negotiations were in progress, and when there is anything to communicate an official announcement will be made to the shareholders. A final dividend was declared of 17½%, less income tax, on the ordinary shares, making 25% for the year, compared with 15% for the previous year.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d. - 6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
 Bisulphite of Lime £7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
 Borax, Commercial.—Crystals, £19 10s. £20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
 Copper Sulphate. £25—£25 10s. per ton.
 Methylated Spirit. 61 O.P.—Industrial, 2s. 5d. - 2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate. £38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate 3½d. per lb. ex whf. Lond. in cwt. kegs.
 Sal ammoniac.—£45 - £50 per ton. Chloride of ammonia £37 - £45 per ton, carr. paid.
 Salt Cake. £3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots, £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included.
 Sod. Chlorate.—2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
 Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
 Arsenic, Sulphide, Yellow.—2s. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 2d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime, Brown, £9 per ton. Scarce. Grey, £17 5s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal. £8 5s.—£10 per ton and upwards, according to grade and locality. Very scarce and fair demand.
 Iron Liquor.—1s. 6d. per gal. 32° Tw.; 1s. 2d. per gal. 24° Tw.
 Red Liquor.—10d. - 11d. 16° Tw. per gal.
 Wood Creosote.—2s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 10d. - 4s. per gal., 60° O.P. Solvent, 4s. per gal., 40% O.P. Both scarce and in fair demand.
 Wood Tar.—£4—£5 per ton and upwards, according to grade.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carboic.—Crystals, about 7d. per lb. Crude 60's, 1s. 8d.—1s. 10½d. per gal.
 Acid Cresylic, 99/100.—2s. 3d. per gal. Steady. 97/99.—2s. 2s. 6d. per gal. Pale, 95%, 1s. 10d. - 2s. 6d. per gal. Dark, 1s. 9d. 2s. 3d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40% - 3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 4d.—1s. 5d. per gal., ex works in tank wagons; Standard motor, 2s.—2s. 3d. per gal., ex works in tank wagons; Pure, 2s. 3d. - 2s. 6d. per gal., ex works in tank wagons. Steady.
 Toluole.—90%, 2s. to 2s. 3d. per gal. Firm. Pure, 2s. 3d.—2s. 6d. per gal.
 Xylol.—2s. 3d.—2s. 6d. per gal. Pure, 4s. per gal.
 Creosote.—Cresylic 20/24%.—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal.
 Naphtha.—Crude, 10d.—1s. 1d. per gal., according to quality. Solvent 90/160, 2s.—2s. 2d. per gal. Solvent 95/169, about 2s. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £9 per ton.
 Naphthalene.—Crystals, £11 10s.—£12 per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—112s. 6d.—140s. per ton, f.o.b. according to district. Scarce. Prices nominal.
 Pyridine.—90/140.—12s.—17s. per gal. Nominal. 90/180.—8s. 6d.—9s. per gal. Heavy.—7s.—10s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—2s. 2d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—9½d. per lb., naked at works.
 Aniline Salts.—9½d. per lb., naked at works.
 Anthranilic Acid.—6s. 6d. per lb. 100%
 Benzaldehyde.—2s. 1d. per lb.
 Benzdine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
o-Cresol 29/31° C.—4d.—4½d. per lb. Quiet.
m-Cresol 98/100%.—2s. 3d. per lb. Fair enquiry.
p-Cresol 32/34° C.—2s. 3d. per lb. Fair enquiry.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dimtrobenzene.—9d. per lb., naked at works.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10½d. per lb. d/d.
α-Naphthol.—2s. per lb. d/d.
β-Naphthol.—11d.—1s. per lb. d/d.
α-Naphthylamine.—1s. 3d. per lb. d/d.
β-Naphthylamine.—3s. per lb. d/d.
p-Nitraniline.—1s. 9d. per lb. d/d.
m-Nitraniline.—3s. per lb. d/d.
o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—7d. per lb., naked at works.
 Nitronaphthalene.—9d. per lb. d/d.
 R. Salt.—2s. 4d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
o-Toluidine.—9d. per lb., naked at works.
p-Toluidine.—2s. 2d. per lb. ex works, naked.
m-Xyline Acetate.—2s. 11d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 5d.—2s. 6d. per lb. Firm.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity.
 Acid, Boric B.P.—Cryst. £40 per ton. Powder £44 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 3½d.—1s. 4½d. per lb. Less 5% Weak market.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4d.—1s. 5½d. per lb. Firm and good enquiry. Technical 1s.—1s. 0½d. per lb.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 0½d. per lb. Less 5%
 Amidol.—9s. 6d. per lb. d/d.
 Acetanilide.—1s. 7d.—1s. 8d. per lb. for quantity.
 Amidopyrim.—11s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Aspirin.—2s. 4d.—2s. 5d. per lb. Good demand.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzophenanthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.

Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carry paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 2d.—2s. 3d. per lb. Potassium.—1s. 9d.—1s. 10d. per lb. Sodium.—2s.—2s. 1d. per lb. All spot.
 Calcium Lactate.—1s. 4d.—1s. 6d. per lb.
 Chloral Hydrate.—3s. 3d.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ether meth.—1s. 1d.—1s. 11½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—6s. 6d.—7s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 8d. per gal. f.o.r. makers' works, naked.
 Hydroquinone.—4s. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perochloride.—22s. per cwt., 112 lb. lots.
 Magnesium Carbonate.—Light Commercial £33 per ton net. Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%; Heavy Pure 2s.—2s. 3d. per lb., according to quantity.
 Menthob.—A.B.R. recryst. B.P., 18s. 9d. per lb. net. Synthetic, 11s.—12s. per lb., according to quantity. Liquid (95%), 12s. per lb. Detached cryst., 15s. per lb.
 Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb.; Levig., 6s.—6s. 1d. per lb.; Corrosive sublimate, Lump, 4s. 8d.—4s. 10d. per lb., Powder, 4s. 10d.—4s. 11d. per lb.; White precip., Lump, 4s. 10d.—5s. per lb., Powder, 4s. 11d.—5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d. per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide, 5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d. per lb.; Sulph. mg., 4s. 10d.—4s. 11d. per lb.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonal.—15s. 6d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—3s. 9d.—4s. per lb.
 Phenazone.—5s. 9d.—6s. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 82s. per cwt., less 2½% for ton lots. Dearer.
 Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
 Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6½d. per lb. spot.
 Quinine Sulphate.—2s. per oz.—1s. 8d.—1s. 9d. per oz. in 100 oz. tins.
 Resorcin.—4s.—4s. 3d. per lb. spot.
 Saccharin.—55s. per lb. Quiet.
 Salol.—3s.—3s. 3d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—80s.—85s. per cwt. net, according to quantity.
 Sod. Salicylate.—Powder, 1s. 10d.—1s. 11d. per lb.; Crystal, 1s. 11d.—2s. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton, according to quantity, 1-cwt. kegs included.
 Sulphonol.—10s. 6d. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
 Thymol, Purif.—11s. 6d.—12s. per lb., according to quantity. Natural.—17s. 6d. per lb

PERFUMERY CHEMICALS

Acetophenone.—8s. 3d. per lb.
 Aubepine (*ex Anethole*).—12s. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb. Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21.22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. 3d. per lb. Benzyl Alcohol free from Chlorine.—2s. 3d. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 4d. per lb.
 Cinnamic Aldehyde.—Natural, 18s. per lb.
 Coumarin.—11s. per lb.
 Citronellol.—15s. per lb.
 Citral.—9s. 6d. per lb.
 Ethyl Cinnamate.—10s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—9s. 9d. per lb. Geraniol (Palmarosa).—19s. per lb. Geraniol.—6s.—10s. 6d. per lb. Heliotropine.—4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Shui Oil*) 12s. per lb.—(*ex Bois de Rose*) 17s. per lb. Linalyl Acetate.—(*ex Shui Oil*) 15s. per lb.—(*ex Bois de Rose*) 18s. 6d. per lb.
 Methyl Anthranilate.—9s. 3d. per lb.
 Methyl Benzoate.—4s. 6d. per lb.
 Musk Ketone.—36s. per lb.
 Musk Xylol.—8s. 6d. per lb.
 Nerolin.—3s. 9d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—11s. per lb.
 Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 6d. per lb. Vanillin.—18s. 6d.—19s. 6d. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—31s. 6d. per lb. Bourbon Geranium.—12s. per lb.
 Camphor.—63s. 6d. per cwt. Cananga, Java, 20s. per lb. Cassia, 80/85%.—8s. 6d. per lb. Cinnamon, Leaf.—5½d. per oz. Citronella.—Java 85/90%.—2s. 4d. per lb., Ceylon, Pure, 1s. 11d. per lb. Clove, pure.—6s. 6d. per lb.
 Eucalyptus, 75/80%.—2s. per lb. Lavender.—French 38/40%.—21s. per lb. Lemon.—9s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—9s. 9d. per lb. Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—10s. per lb. Peppermint.—Wayne County, 25s. 6d. per lb. Japanese, 9s. 6d. per lb. Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Feb. 28th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Jan. 13th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Altpeter. Centrifuges. 32,648—9. Dec. 24.
 Brassert & Co., Ltd. (Brassert). 32,724. See II.
 Carrier Engineering Co., and Groom. Conditioning gases. 32,719. Dec. 24.

Duchemin. 32,283. See II.
 Excelsior Feuerlöschgeräte A.-G., and Treichel. Production of foam. 32,536. Dec. 23. (Ger., 24.12.25.)
 Gibbs. Apparatus for concentrating and evaporating liquids. 32,482. Dec. 23.
 Gibson. Filtering-machine for acid liquors etc. 32,537. Dec. 23.
 Hardinge Co., Inc. Apparatus for classifying pulverised materials. 32,573. Dec. 23. (U.S., 28.8.25.)
 Hofmann. Mixing etc. machines. 32,229. Dec. 20. (Switz., 30.12.25.)
 I.-G. Farbenind. Production of active silica. 32,191—2. Dec. 20. (Ger., 19.12.25.)
 Kreutzberg. Pulverisers. 32,346. Dec. 21. (U.S., 5.11.26.)
 Parc Engineering Co., Ltd., and Player. Means for mixing gases and liquids. 32,522. Dec. 23.
 Plumbridge, and Salt Union, Ltd. Apparatus for concentrating and evaporating liquids. 32,482. Dec. 23.
 Reavell. Furnaces. 32,435. Dec. 22.

II.—Complete Specifications

20,178 (1925). Lever Bros., Ltd., and Cloudsley. Filtering apparatus. (262,840.)
 22,667 (1925). Saureschutz Ges. Coating vessels etc. to render them chemically stable. (250,525.)
 27,851 (1925). Johnson (Badische Anilin & Soda Fabrik). Feeding solids into or removing solids from vessels under pressure. (262,901.)
 28,056 (1925). Grimbale, Caird, and Coombs. Centrifugal separators for liquids. (262,902.)
 32,361 (1925). Baker Perkins, Ltd., and Dewhurst. Hydro-extractors. (262,954.)
 12,740 (1926). Mortensen. Centrifugal separators or clarifiers. (263,021.)
 17,860 (1926). Carrier, and Carrier Engineering Corp. Refrigerating methods. (263,052.)
 *31,421 (1926). Morterud. Evaporation of liquids. (263,132.)
 *31,903 (1926). Siemens-Schuckertwerke. Crucibles. (263,171.)
 *32,191 and 32,192 (1926). I.-G. Farbenind. Production of wide-porous active silica. (263,198—9.)

II.—Applications

Akt. Ljungströms Angturbin. Producing an air mixture for combustion in furnaces. 32,212. Dec. 20. (Sweden, 22.12.25.)
 Brassert & Co., Ltd. (Brassert). Apparatus for washing gas. 32,724. Dec. 24.
 Broadhead, and Dempster & Sons. Manufacture of gas. 32,151—4. Dec. 20.
 Donald. Carbonisation of coal etc. 32,606. Dec. 24.
 Duchemin. Gas-scrubber. 32,223. Dec. 20. (Fr., 31.12.25.)
 Evans (Kohlenveredlung A.-G.). Distillation of carbonaceous etc. substances. 32,434. Dec. 22.
 Halden. Carbonisation of coal etc. 32,189. Dec. 20. (Fr., 21.12.25.)
 Humphreys & Glasgow, Ltd. Apparatus for carburetting water gas. 32,715. Dec. 24. (U.S., 1.3.26.) Apparatus for making gas. 32,716. Dec. 24. (U.S., 1.3.26.)
 Laing and Nielsen. Manufacture of gas. 32,248. Dec. 20. Soc. Ammonia. Purifying gas. 32,714. Dec. 24. (Fr., 4.1.26.)
 Steinschneider. Distillation of oils etc. 32,598. Dec. 23. (Czecho-Slovakia, 15.1.26.)
 Stettiner Chamotte-Fabrik. Coking etc. ovens. 32,325. Dec. 21. (Ger., 24.12.25.)

II.—Complete Specifications

15,997 (1925). Chavanne. Gasification of solid fuel and volatilising or reducing ores. (237,883.)

16,014 (1925). Nielsen and Laing. Manufacture of gas. (262,834.)

*25,920 (1925). Flow Coal Washery Co., Ltd., Russell, and Austin. Coal-washing and like apparatus. (262,890.)

*32,751 (1925). Forrest and Hayden. Destructive distillation of bituminous materials etc. (262,959.)

*13,343 (1926). Florentin, Kling, and Matignon. See XX.

*31,826 (1926). De Bataafsche Petroleum Maatschappij. Manufacture of refined lubricating and like oils. (263,167.)

*32,019 (1926). Siemens & Halske A.-G. Manufacturing mineral oils and tar products. (263,186.)

*32,189 (1926). Halden. Low-temperature carbonisation. (263,197.)

III. Complete Specification

*32,019 (1926). Siemens & Halske A.-G. See II.

IV. Applications

I.-G. Farbenind. Production of benzanthrone dyestuffs. 32,194. Dec. 20. (Ger., 18.12.25.) Anthraquinone dyestuffs. 32,225. Dec. 20. (Ger., 23.12.25.)

Production of anthraquinone dyestuffs. 32,301. Dec. 21. (Ger., 22.12.25.) Manufacture of dyestuffs. 32,555. Dec. 23. (Ger., 23.12.25.)

Newport Co. Tetrakisazo dyes. 32,187. Dec. 20. (U.S., 6.2.26.)

Scottish Dyes, Ltd., Morgan, Thomas, and Thomson. Dyestuffs. Dec. 20.

Soc. Chem. Industry in Basle. Manufacture of dyestuffs. 32,693. Dec. 24. (Switz., 24.12.25.)

IV.—Complete Specifications

26,801 (1925). I.-G. Farbenind. Manufacture of vat dyestuffs of the isodibenzanthrone series. (242,620.)

28,946 (1925). Kalle and Co. Producing nitriles of the benzanthrone series. (243,026.)

32,700 (1925). Brit. Synthetics, Ltd., and Higgins. Manufacture of intermediates for the preparation of azo-dyestuffs. (262,958.)

12,259 (1926). Brit. Dyestuffs Corporation, Ltd., Rodd, and Everatt. See XX.

*31,813 (1926). I.-G. Farbenind. Manufacture of azo-dyestuffs. (263,164.)

*31,907 (1926). I.-G. Farbenind. Manufacture of thiomorpholines of the anthraquinone series. (263,179.)

*32,107 (1926). Chem. Works (Sandoz). Production of substantive dyestuffs of the stilbene series fast to alkali. (263,192.)

*32,194 (1926). I.-G. Farbenind. Manufacture of vat dyestuffs of the benzanthrone series. (263,200.)

*31,978 (1926). I.-G. Farbenind. Manufacture of condensation products of the anthraquinone series. (263,178.)

V.—Applications

Brit. Celanese, Ltd. Phosphoric acid solutions of cellulose. 32,530. Dec. 23. (U.S., 30.12.25.)

Brit. Celanese, Ltd., and Kinsella. Manufacture of artificial silk etc. 32,531. Dec. 23.

Brit. Dyestuffs Corp., Ltd., and Hailwood. Manufacture of derivatives from ligninsulphonic acid. 32,322. Dec. 21.

Butterworth and Conlong. Spinning artificial silk etc. 32,142. Dec. 20.

Courtaulds, Ltd., Hazeley, and Hegan. Production of threads etc. from viscose. 32,193. Dec. 20.

Hands, and Spievers, Ltd. Manufacture of sheets of compositions containing cellulose esters etc. 32,582. Dec. 23.

V.—Complete Specifications

17,548 (1926). Heberlein & Co. Chemically varying vegetable fibres. (255,453.)

*2442 (1926). I.-G. Farbenind. Production of celluloid-like masses. (263,076.)

*27,718 (1926). Meyer-Sansboeuf Ges. Improving vegetable textiles. (263,102.)

*31,154 (1926). I.-G. Farbenind. Manufacture of cellulose esters. (263,128.)

VI.—Applications

I.-G. Farbenind. Treatment of animal fibres. 32,421. Dec. 20. (Ger., 7.1.26.)

Silver Springs Bleaching & Dyeing Co. Ltd., and Hall. Dyeing etc. textile materials consisting of cellulose acetate silk. 32,374. Dec. 22.

VI.—Complete Specifications

22,771 (1925). Sazanoff. Printing with basic dyestuffs. (262,849.)

26,800 (1925). I.-G. Farbenind. See XIII.

4001 (1926). Bloxam (I.-G. Farbenind). Producing fast printings. (262,987.)

*18,215 (1926). I.-G. Farbenind. Dyeing of fast mixed shades on silk. (263,088.)

*31,844 (1926). Karrer. Treatment of cotton fibres, preparatory to dyeing. (263,169.)

VII.—Applications

Gibson. 32,537. See I.

I.-G. Farbenind. 32,191. See I.

Vohl and Co. A.-G. Purification of solutions of metal salts. 32,518. Dec. 23. (Ger., 24.12.25.)

VII.—Complete Specifications

23,647 (1925). Boderer. See XVI.

30,105 (1925). Tennant (N. V. Gloeilampfabriek). Manufacture of fluorine. (262,918.)

14,805 (1926). Harris (Heberlein). Manufacture of stannic acid or oxides of tin. (263,034.)

*32,191 (1926). I.-G. Farbenind. See I.

VIII. Complete Specifications

1766 (1926). Deutsche Gasglühlicht-Auer-Ges. Manufacture of refractory articles of pure oxide of zirconium. (246,481.)

*32,126 (1926). Scheidhauer & Gessing. Process of manufacturing refractory acid-proof, and other ceramically-bonded products. (263,194.)

*32,127 (1926). Fibremo Soc. Co-operative. Enamelling objects of fibrous-cement with vitreous enamels. (263,195.)

IX.—Applications

Roberts. Building material. 32,590. Dec. 23.

Schantz. Preserving wood etc. 32,251. Dec. 20. (Ger., 16.1.26.)

IX.—Complete Specifications

14,991 (1925). Landman. Producing cellular or porous concrete. (243,308.)

*30,882 (1926). I.-G. Farbenind. Production of cements. (263,124.)

*31,823 (1926). Andreas. Burning cement, lime, hydraulic lime, etc. (263,166.)

*31,919 (1926). Malenkovic. Preservation of wood. (263,173.)

*32,127 (1926). Fibremo Soc. Co-operative. See VIII.

X.—Applications

County Chemical Co., Ltd., Hambrecks, and Hill. Soldering-flux. 32,140. Dec. 20.

Dreaper. Alloys. 32,671. Dec. 24.

Kohlswa Jernverks Akt. Manufacture of steel. 32,535. Dec. 23. (Sweden, 23.12.25.)

Siemens A.-G., Durrer, and Sprenger. Manufacture of steel. 32,680. Dec. 24.

X.—Complete Specifications

15,997 (1925). Chavanne. See II.

31,553 (1925). Johnson (I.-G. Farbenind.). Manufacture of pure iron. (262,938.)

12,104 (1926). Metallbank und Metallurgische Ges. Electrothermic production of aluminium silicon alloys. (252,160.)

- 17,454 (1926). Internat. Copperclad Co. Apparatus for electrodeposition. (255,113.)
 24,695 (1926). Canzler. Alloy for welding copper. (260,565.)

XI.—Applications

- Alber. Electrodes for secondary cells. 32,617. Dec. 24.
 Brit. Thomson-Houston Co., Ltd. Electric furnaces. 32,181. Dec. 20. (U.S., 24,12,25.)
 Campbell, Taylor, and Electric Furnace Co. Electric furnaces. 32,224. Dec. 20.
 Rogers (Ela Elektrische Grubenlampen- und Accumulatoren Ges.)• Electric accumulator. 32,197. Dec. 20.

XI.—Complete Specifications

- 23,084 (1925). North. Electric furnaces. (262,859.)
 12,104 (1926). Metallbank und Metallurgische Ges. See X.
 12,824 (1926). Stone. Electric storage batteries. (263,024.)
 17,454 (1926). Internat. Copperclad Co. See X.

XII.—Application

- Lewis. Apparatus for extracting oils, fats, etc. from animal etc. matter. 32,429. Dec. 22.

XII.—Complete Specification

- 30,073 (1926). Böhme A.-G. Sulphurising of fatty acids and their esters. (263,117.)

XIII.—Application

- Jeremias. Production of waterproof impregnating etc. coatings. 32,232. Dec. 20.

XIII.—Complete Specifications

- 26,800 (1926). I.-G. Farbenind. Colouring of plastic materials. (242,274.)
 22,817 (1925). Meister, Lucius, und Bruning. See XX.
 *30,543 and 30,549 (1926). New Jersey Zinc Co. Manufacture of lithopone. (263,119 and 263,120.)
 *31,948 (1926). I.-G. Farbenind. Manufacture of oil lacquers and varnishes. (263,175.)
 *32,006 (1926). Siemens und Halske A.-G. Producing protective and resistant coatings. (263,183.)
 *32,007 (1926). I.-G. Farbenind. Manufacture of oil lacquers and varnishes. (263,184.)

XIV.—Application

- Dunlop Rubber Co., Ltd., Thomas, and Twiss. Manufacture of rubber etc. 32,150. Dec. 20.

XIV.—Complete Specification

- 32,957 (1925). Illeman Waterproof composition. (262,961.)

XV.—Complete Specification

- 7882 (1926). Magnus. Manufacture of artificial leather. (263,004.)

XVI.—Application

- Carpmael (I.-G. Farbenind.). 32,209. See XXIII.

XVI.—Complete Specifications

- 14,986 (1925). Adelantado. Manufacture of phosphate fertilizer. (262,833.)
 23,647 (1925). Bodero. Manufacturing superphosphate. (262,878.)

XVII.—Complete Specification

- 16,475 (1926). Corn Products Refining Co. Producing dextrose from starch-bearing materials. (254,729.)

XIX.—Application

- Baker Perkins, Ltd. Producing refined cocoa. 32,437. Dec. 22.

XIX.—Complete Specification

- 11,011 (1926). Bu. Preparation of a cattle food-stuff. (263,014.)

XX.—Applications

- Franklin, and Synthetic Ammonia and Nitrates, Ltd. Production of methanol etc. 32,483. Dec. 23.
 Grouchkine. Diiodotrimethylamine product. 32,725. Dec. 24.
 Timmis, and Wellcome Foundation, Ltd. Manufacture of therapeutic compound. 32,497. Dec. 23.

XX.—Complete Specifications

- 22,817 (1925). Meister, Lucius, und Bruning. Improving decaamphorated oil of turpentine. (239,878.)
 22,892 (1925). Rupe. Manufacture of hydro-cyclic- ω -amino methyl compounds. (240,814.)
 30,792 (1925). Riedel. Manufacture of barbituric acid derivatives. (244,122.)
 12,259 (1926). British Dyestuffs Corporation, Ltd., Rodd, and Everatt. Manufacture of dinikrotoluene. (263,018.)
 *13,343 (1926). Florentin, Kling, and Matignon. *Obtaining light hydrocarbons from oxygenated organic compounds. (263,082.)
 *31,612 (1926). Binz and Rath. Production of 2-oxy-3-bromo-5-pyridinecarboxylic acid. (263,142.)
 *31,732 (1926). Naef et Cie. Preparation of monocyclic ketones having more than nine ring members, and of their alkyl derivatives. (263,153.)
 *31,812 (1926). I.-G. Farbenind. Manufacture of polycyclic compounds containing oxygen. (263,163.)
 *31,751 (1926). Schröder. Manufacture of protective and curative agents from glandular organs. (263,155.)
 *32,106 (1926). Chemical Works (Sandoz). Production of 2-amido-4-nitrophenoxymethanol or propandiol. (263,191.)

XXI.—Complete Specification

- 29,191 (1926). Soc. du Film en Couleurs Keller-Dorian, and Richard. Colour photography. (263,115.)

XXIII.—Applications

- Carpmael (I.-G. Farbenind.). Fungicides. 32,209. Dec. 20.
 Jackson. Apparatus for treatment of sewage. 32,184. Dec. 20.

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department, and stating the specific reference number:—
Brazil: Earthenware, glassware (734); *Colombia*: Cement, iron bars, asbestos roofing, paint, varnish, lubricating oil, linseed oil (735); *Danzig*: Pharmaceutical chemicals (726); *South Africa*: Pig iron, ferro silicon (A.X. 4037); *United States*: Glycerin (B.X. 3116).

Safeguarding of Industries Act, 1921

The Board of Trade has published additional lists of articles chargeable with duty under Part I of the Safeguarding Act (H.M. Stationery Office, 11 pp., price 2d.). The lists relate to optical instruments and glass, scientific glassware, laboratory porcelain, scientific instruments, synthetic organic chemicals (other than synthetic organic dyes and intermediates), analytical reagents, all other fine chemicals (except sulphate of quinine of vegetable origin), and chemicals manufactured by fermentation process. Some hundreds of compounds are covered by the list of synthetic organic and fine chemicals.

British Visada Artificial Silk Co., Ltd.

It is expected that this company will start production on a commercial basis at the Python Mill, Littleborough, in a few days. Good arrangements have been made for coal supplies, and the mill will produce about 27,500 lb. of artificial silk weekly. Mr. S. S. Napper, who for eighteen years was chief of works and research chemist with Courtaulds, Ltd., has been made a director, and will act as consulting chemist. The company is in a strong position, and after carrying out its full programme is left with a working capital of £100,000.

Second Anglo-Scottish Beet Factory

The second Anglo-Scottish Beet Sugar Corporation factory at Preston Hall, Cupar, Fife, was opened on December 11. The factory, which cost over £400,000, had been built in less than a year, and is producing excellent sugar.

New Viscose Factory in Bristol

The factory of the Western Viscose Silk Mills Company, capable of a weekly output of 12 tons, was opened on December 7 by the Lord Mayor of Bristol. The company was formed in 1925, with an authorised capital of £400,000, to manufacture superior quality fine Denier artificial silk yarn by means of the viscose process.

Electricity Supply

The sixth annual report of the Electricity Commissioners for the year ended March 31, 1926 (H.M. Stationery Office, 3s. net), states that at the end of the period there were 596 authorised undertakings (including 238 in the hands of companies and persons) in Great Britain. Altogether 584 stations generated 8,122,961,823 units, an increase of 9.5%, and the fuel consumed included 8,263,880 tons of coal, 142,876 tons of coke breeze and 38,810 tons of fuel oil. The consumption of coal and coke thus increased by about 5.2% compared with the previous year, whilst the consumption of fuel oil decreased by 15,600 tons a reduction of over 28%.

For Photographers

Amongst the many special diaries now issued, that published by Wellington & Ward, Ltd., has long gained the favour of the photographer. The 1927 edition contains, in addition to the usual diary, exposure tables, standard development formulæ, tables and other information for development, and notes on the use of light filters with the Spectrum panchromatic plate. Since the last edition was published, the firm has added Wellington portrait films, X-ray films and a new development paper to the list of Wellington products. The information given is just of the kind required, and photographers will find the diary particularly useful.

A Diary for Dyers

Scottish Dyes, Ltd., have produced a neat diary which should appeal to users of dyes, as the usual matter common to pocket diaries is enriched by the inclusion of information about the Caledon, Solway, Celatene and Soledon colours made at Grangemouth by this firm. There are tables of fastness, tables for identifying various dyes, instructions for dyeing and printing various materials, and other information useful to the dyer, whilst a separate notebook is included within the covers.

PUBLICATIONS RECEIVED

LUBRICATION IN COLLIERY PRACTICE. By N. Simpkin, M.Sc. (Tech.). A.I.C. Assoc. M.J.Min.E., and A. Dave, B.Sc. (Tech.). A.I.C. Pp. xiv + 167. London: The Colliery Guardian Co., Ltd., 1926. Price 10s.

No. 2

EDITORIAL

Fuel Research Board

THE Department of Scientific and Industrial Research has just published the Report of the Fuel Research Board for the year 1925. The coal strike last year prevented its earlier publication. One of the most interesting parts of this report deals with the question of low-temperature carbonisation. It is pointed out the gas industry has for very many years been engaged in the carbonisation of coal, and has from time to time varied and adapted its processes so as to obtain every therm, every by-product, and every residue, in the most saleable and valuable condition and at the lowest possible cost. An industry in which more than a hundred and fifty million pounds sterling is employed, which has been experimenting for a century and has been commercially successful, is not likely to adopt a less remunerative method of carbonisation nor to refuse to adopt a more remunerative method. In the words of the report, "Although it is apparent from what has been said that low-temperature carbonisation is not likely to displace the present processes used in the gas industry, it holds out certain prospects of which the industry is fully aware. If millions of tons of coal, otherwise consumed in the raw state, could be replaced by smokeless fuel, a field would be opened up for an extension of the operations of the companies, and which might be justifiable even if the profit per ton were less than that obtainable by existing methods." The economics of the problem is in this case the whole problem. On one point we have by our own experience come to a definite conclusion. A good smokeless fuel such as we have burned in our own grates for three years, and will burn again so soon as supplies are available, is beneficial to the whole community because it pours no smoke into the air; it is pleasant in the house, and after the first month it has been preferred by all the feminine element in our domestic economy; an editor who keeps many papers lying about in his study will prefer it because his room will be much cleaner and he will never be called upon in a hurry to remove all his

books and papers to prepare for a visit at dawn from the chimney sweep. We have never made an exact comparison of the heating effect in our grates of coalite and coal, but we would certainly pay rather more for a ton of a good smokeless fuel than for a ton of best Derby Brights. We have every hope that some day in the future a system of carbonisation will be devised which will give us our smokeless fuel, give the nation its oil, and give the shareholders a reasonable dividend. Our hope is clear and bright, parts of it we know can be realised, we have not received really convincing evidence that the whole of it can be realised. The investigation of fuels is by no means confined to an examination of low-temperature carbonisation. A survey is being made of the coal resources of the country, and the many varieties of coal which are found here, and it seems that the whole question of fuels and their use is being carefully and methodically investigated. The problem is so vast and the material to be examined is so diverse that no private body could undertake the task. Only a government department could do the work properly, and, in our opinion, the work is being well done, and the information is published in a convenient and proper manner. The treatment of coal by hydrogenation and by the addition of oil or steam is also being watched with interest. We gather from the *Morning Post* that International Combustion, Ltd., has taken steps to form a merger of a number of coal, fuel and power interests, and that the company has secured a contract to construct the Hams Hall Super Power Station, near Birmingham, at a cost of about £1,500,000. It is said that the company intends to develop a great low-temperature carbonisation scheme, and that Sir Harry McGowan, Mr. B. E. Todhunter, and Col. G. P. Pollitt have joined the board of International Combustion, Limited. As these gentlemen are also on the board of Imperial Chemical Industries, it is obvious that the fuel question will have the advantage of the experience and technical knowledge which has been acquired by the most active and enlightened

chemical industry in this country. Scientific knowledge, combined with experience and good sense, can solve any problem; the solution may be satisfactory or not; no one can achieve the impossible. It seems that all these factors are now placed at the disposal of those who, whether in government departments or in private industrial concerns, are trying to put the fuel industry on to a good basis.

Valency

Valency is a measure of the combining power of an element; in some elements the valency never alters; in others the valency is sometimes one number, sometimes another; a few elements can in different circumstances have three or more different valencies. A divalent element like oxygen can occasionally exist as a quadri-valent element; when it is divalent one atom of oxygen can combine with two atoms of hydrogen and the molecule will have some definite configuration in space. If we regard an atom as a small nucleus with electrons, also small, revolving round it at distances very great in comparison with the diameter of the nucleus, we shall find it very difficult to draw an exact boundary between the empty space which is included in what we roughly consider as the atom and the empty space excluded from it; there is no boundary: when we have ascertained the positions of the nuclei and the electrons all the rest is reduced to a number of electrical attractions and repulsions which no doubt become rapidly feebler as we get away from the vicinity of the nuclei and electrons. The atom has no defined shape like a crystal; it has a definite position in the molecule, and the valencies of the atoms determine the general configuration of the molecule. If we consider one divalent atom A with two monovalent hydrogen atoms B and place the nuclei as in the diagram, it seems probable that the attraction between the various electrons and the nuclei in the line B A B will tend to compress, in that part of the molecule the vague volume

which we regard as the atom A, and there will be no corresponding force to compress the atom A in the direction C C. We suppose, after due reflection, that this is what Mr. Murgatroyd means by the rather awkward phrase he uses about the oxygen atom being the shape of a bolster. It is in this sort of way that valency expresses itself in the configuration of the molecule. The shape of the molecule depends almost entirely on the number of the nuclei and the valencies associated with each nucleus: these will arrange themselves in accordance with the laws of electrical attraction, and if

the final arrangement results in the nuclei in one line being closer to each other than the nuclei in other lines, we can, we suppose, think of the atom concerned being flattened or lengthened or tetrahedral and so on. Ninety per cent. of the atom is nothingness, and when it adjoins some other nothingness there is neither boundary nor change nor anything else to show or imagine. Pope and Barlow some years ago developed a hypothesis that four spheres of unit size arranged in a tetrahedron could conveniently represent a carbon atom, two spheres of unit size adjoining each other would represent an oxygen atom, and that one sphere of unit size would represent a hydrogen atom. The combination of the proper number of such spheres gave results which in most cases seemed to agree with the measurements of crystals of the compounds concerned, but the hypothesis cannot yet be said to be either proved or disproved. The analysis by X-rays of a number of organic compounds will in due course throw much light on this particular problem: it has hardly thrown much up to now.

British Chemical Standards

A few years ago an organisation was formed to prepare a number of standards for use primarily in the iron and steel trade. The organisers have now presented a report covering the three years working up to September, 1925. The report shows unmistakable signs of progress and efficiency. There is a certain amount of modesty which hides the names of those most actively engaged in the work, but the standing of the organisation is shown by the co-operation of such well-known men as Dr. J. T. Dunn, Dr. B. Dyer, and Dr. Voelcker, who are included in the list of referee analysts, and of such well-known firms as Messrs. Pease & Partners, Consett Iron Company, Alfred Hickman, Hadfields, Cammell Laird & Co., W. Beardmore & Co., and Bolckow Vaughan & Co. Standards of various materials are supplied at a low cost as a guide to purchasers. The standards are in use in this country, in Belgium, France, South Africa, the United States, and several other countries; the use of these standards appears from the report to be steadily and slowly growing, not only in the iron and steel industry, but also in the paint industry, explosive industry, in mines, and by public analysts and educational establishments. The standards already prepared and distributed include a dozen different varieties of steel each suited for a particular type of material, two nickel steels, two other alloy steels, three varieties of cast iron, a basic slag, an iron ore, a manganese ore and a non-ferrous white metal suitable for bearings and packing. It is intended to proceed with the preparation of standards of other non-ferrous alloys. We are glad to notice that the organisers urge "the importance of not reporting analyses in such a way as to imply a greater accuracy than can be reasonably expected in practice," and it is recommended that analyses should not be reported to more than three significant figures. It appears that during the first year the organisation involved a deficit of about six hundred pounds, which has been made good in the course of the next two years. The report is worth reading, and may be obtained from the organisers of British Chemical Standards, 3, Wilson Street, Middlesbrough. A casual perusal of it suggests that the organisation is well run, and will grow until its standards are very familiar.

STATISTICS IN INDUSTRY: SOME USES AND LIMITATIONS*

By H. C. MARRIS, M.I.Chem.E.

For the purpose of this paper Industry may be divided into three sections: (1) Buying; (2) Manufacture; and (3) Selling. As every purchase involves a sale, the first and third sections may be considered together, the one being a mirror image of the other.

As sections one and three are severally at least as important as section two, and collectively are of more consequence, any statistical information which aids efficient buying and selling is of paramount importance.

Could not efficient buying be defined as selecting that moment for buying when the market is at its lowest, and purchasing sufficient quantities to suffice until the upward trend is passed and the price is again at its lowest? The mirror image of this, as defining efficient selling, might be regarded as selecting that moment when the market is highest and unloading the greatest amount possible of goods at that price.

To be able to meet the conditions of these definitions it is necessary to know, as far as possible in advance, the prospects of supply and demand for the goods concerned, both as raw material and completed article. That is to say, one should be in a position to forecast what is about to happen in industry.

Trade forecasting might be divided into two sections: (1) Long term forecasts, such as those applying to the exhaustion of natural resources like coal or food; these are usually unpleasant prophecies and are generally thoroughly unreliable, but have the advantage to the prophet that he is dead before he can be repudiated. The second section might be considered as composed of (a) trade cycles and (b) short term forecasting affecting immediate requirements.

As the one influences the other, and there is no sharp line dividing them, they will be considered together.

Trade cycles are rhythmic fluctuations in which the general level of prices rises for a period of years, reaches a maximum, dies down, reaches a minimum, and starts all over again, and, of course, have enormous influence on trade by increasing or reducing the purchasing power of the community.

If it were possible to predict the start of the rise of the trade cycle, then efficient buying would be much simplified; again, it would be extremely valuable to know when the peak of the cycle had been attained.

According to Sir William Beveridge, although this rhythmic movement is common to all advanced industrial countries, yet the movement, though rhythmical, is quite irregular in length. The time required for trade to pass through all the phases of the

cycle—depression, revival, prosperity, strain or crisis, liquidation, to depression again—may be as little as six years or as much as eleven. In exceptional cases the time may exceed these limits, and there is nothing to suggest any fixed periodic influence. The range of the movements is equally irregular. One maximum of prices may be markedly higher or lower than the one before; when prices fall again they may drop to about the level from which they arose, or much further, or not so far.

Short time forecasting is affected by natural phenomena, such as wet or dry seasons, by social upheavals, such as war, revolutions, strikes, by the more ordinary alterations in levels of production and consumption, and by financial influence such as alterations in bank rates and foreign exchanges.

It is unnecessary to consider long term prophecies, but how far do available statistics help as regards trade cycles and short term forecasting? Statistics are defined by Bowley as numerical statements placed in relation to each other; they can be classified as amongst that group of interesting and important things which are carefully put on one side until more time is available; for this reason actual statistics have been left out of this paper as far as possible.

Statistics are regarded as being quite a modern innovation, but bills of exchange were used in Germany in the thirteenth century and banking started in Italy a little later, which must have involved statistical work of some sort, though no doubt of a rudimentary nature. In the seventeenth century the Plague of London was the cause of sufficient interest being taken in mortality returns as to produce regular reports of the number of births in London, and Captain John Graunt in 1662 presented to the Royal Society his "Observation on the bills of mortality," which is probably the foundation of statistics in this country.

In connexion with the means for forecasting the movements of trade cycles, Beveridge states that all factors in the economic life of a country are affected by the trade cycle and show a roughly simultaneous rise and fall, though the movement in all cases is only roughly and not absolutely simultaneous. Some factors appear to lag behind, rising and falling many months after the rest. Other factors appear to lead the movement; they begin the rise and they begin the fall; they can be used to suggest when the turn of the cycle from rise to fall, or vice versa, is approaching. Statistics describe and compare large groups or aggregates, but it must be understood clearly that they generalise, and an application of a generalisation or average to a particular

* Paper read before the Institution of Chemical Engineers at the Conference held at the Science Museum, London, on Dec. 9, 1926.

business use must be done very carefully indeed and by one thoroughly familiar with the inner meaning of the statistics employed.

Bowley points out that statistics can be used for the following purposes:-

(1) To give correct views based on facts as to what happened in the past.

(2) To afford material for estimates as regards the present.

(3) To make possible a forecast for the near future by studying changes that have taken place in the near past.

In 1922 the Harvard Economic Service published the results of an inquiry for providing "first a record of fluctuations during alternating periods of business prosperity and depression; and, secondly, a basis for forecasting at any time business conditions of the period immediately ahead." The Harvard University Committee of Economic Research arranged their factors in three main groups: "A—Speculation"; "B—Business"; "C—Money". "A" included the Prices of Industrial Stocks, of Railroad Stocks and Bonds, and Town Clearings at New York Banks; "B" included Commodity Prices, Pig Iron Production and Country Clearings; "C" included rates on four to six months and on 60 to 90 days commercial paper, and Loans and Deposits at New York Clearing Banks. The Committee plotted the movements of these groups over the twelve years 1903–1914, and they showed how in that period the movements of "A" both up and down came almost regularly four to six months before those of "B," and these in turn roughly six months before those of "C." These movements have been plotted as curves, and are given in the paper by Beveridge published by the London and Cambridge Economic Service in January, 1923.

In England the London School of Economics studied the question of forecasting on similar lines, but applying English conditions, and reached similar results to the Harvard investigation. That is to say, movements in one statistical group follow or precede movements in another group, but the law is subject to exceptions, especially when applied to the use of any particular industry.

Dr. Snow, in some work entitled "Trade Forecasting and Prices," read before the Royal Statistical Society recently, examined the question as applied to trade in general and to the leather industry in particular, and studied the relationship between a large number of pairs of published statistics. But the general impression to be obtained from his paper is that (1) the movements do not coincide in a sufficiently large degree to be of much practical use; (2) the statistics available are by no means reliable; (3) the delay in the compilation and issue of statistics may cause an event to happen before its forecast can be prepared.

As a further illustration of the difficulties facing the statistician, Rowe, in an article on the "Physical Volume of Production," states that "we have very little evidence as to the amount of increase in the volume of production required to balance the increase in population from year to year, and we cannot estimate

what the production each year might be expected to be; many of the products of industry are not capable of quantitative measurement at all. In textile manufacture much of the product alters its quality and design from year to year, and comparative statistics are out of the question. Again, in the case of the engineering industry there are not even standard lines, and comparative measurement is absolutely impossible. Even if all the possible statistics of production are assumed to be available, we have the fundamental problem of combining tons of wheat and tons of pig-iron in proportion to their importance as national assets.

"We are forced to the conclusion that for purposes of trade forecasting at present the statistical help available is very limited, but, as Beveridge points out, one who systematically studies the movements of the trade barometer may get a hint when the turn of the cycle from rise to fall or fall to rise is coming sooner than he would do without such study. It may even prove possible to give some help in allowing for the chief 'disturbing factors.' The effect on the trade cycle of harvest success or failure in different countries and at different stages of the cycle can be studied. The discovery of periodic laws regulating harvests themselves may not be beyond human powers. Whether and when an industrial dispute will lead to a stoppage cannot be foretold; but consideration of the times when conciliation agreements run out and have to be revised, or of applications to raise or lower wages, may give useful warnings. A disturbing factor of some importance, the influence of tariffs and other measures of governments, such as currency inflation or deflation, may also be watched and allowed for."

An interesting and useful publication in this connexion is the two charts, one on United Kingdom conditions and the other applying to the conditions in the United States of America, provided at the beginning of the Monthly Bulletin issued by the London and Cambridge Economic Service, which is run jointly by the London School of Economics, the University of Cambridge, and the Federation of British Industries.

The banks might add to their issue of statistics periodically the total amount of overdraft or credit balance belonging to industry, as this might be a valuable indication of trade tendency, the argument being that when trade is good overdrafts increase, but when trade is bad firms realise their stocks and cease to buy such large amounts of raw material, and the balance of money coming in accumulates in the bank. Some trades might be flourishing whilst others languish, but if overdrafts started to decrease, then possibly this would be an indication that general bad trade might be in sight, due allowance being made for any abnormal condition, such as coal strikes.

The defects and limitations of statistics for our purpose are mostly a question of degree and of detail rather than of principle, and efforts are being made to improve them. Recently the General Economic Sub-Committee of the Imperial Conference passed the following resolution:-

"The Imperial Conference, impressed by the need for more complete, more prompt statistics regarding the production, stocks, and consumption of wool through-

out the world, recommends that such steps as are found to be most suitable should be taken to secure the co-operation of foreign countries in this matter, and, further, that the Governments of the Empire represented at this conference should consider the adoption of such measures as are necessary and feasible to secure the provision and publication of such statistics, provided that foreign countries materially concerned, either as producers or consumers, are prepared to take similar action."

Other industries are moving in the matter of improving their statistics, and research is being undertaken by statisticians in their particular science to find the best way of dealing with such figures when obtained.

When all this work and research bears fruit, will not the man who makes use of these aids have an advantage over his rivals who neglect them?

Turning now to the use of statistics in actual manufacture. Here the figures are under better control, the methods of obtaining yields, costs, accounts, etc., are more or less standardised, but, nevertheless, there are differences of opinion as regards the best methods to employ to obtain such statistics, and as the subject is an important one and far too large for the remaining limits of this paper, reference will be made to only one example of works' statistics.

English manufacturers are gradually, but very slowly, following the American policy of pooling knowledge. This process has not proceeded very far, even amongst manufacturers of the same product, but surely if we are to reduce costs sufficiently to meet the intensive competition now in force, both at home and abroad, then we

must pool all our knowledge not only with immediate competitors, but, whenever circumstances permit, the whole of industry must throw its common knowledge into the scales.

There is an important section of an industrial concern which is common to nearly all factories, and that is the generation of power and steam.

A firm generating its own current can compare the cost of its electricity with the charges of the local public power station supply, and can satisfy itself definitely that it is cheaper to make electricity than to buy it, but the economic efficiency of a boiler house cannot be obtained so readily.

With an efficient costing system all the debits of the boiler house can be obtained, and from them the cost per unit of steam made. Now the technical efficiency of a boiler house may be very good indeed; still the cost of the steam it generates may be too high: that is to say, the technically efficient boiler house may be economically inefficient, with the consequence that the whole of the goods manufactured by the aid of such steam are too costly.

We may be confident that our own boiler houses are all that they should be, yet if we had available a standard similar to the electric supply charges we might change our opinion, but unfortunately there appears to be no standard market price for steam.

The Bulletin of the National Heating Association, of October 15, 1925, gives the names and rates of about 150 concerns in the United States which supply heat in the form of steam or hot water to whoever may require it. The rates vary enormously, and in New

% Tan on coal burnt	47.048		
Lbs. available steam per lb. coal	4.849		

York the charge for 1000 lb. steam varies from \$1.75 as the highest retail charge, to 50 cents as the lowest wholesale rate, and there are additional charges varying with the cost of coal. Therefore, although there is in U.S.A. a definite market for steam, and a definite supply, yet we cannot get a market price to serve our purpose. Again, it is true that public electric undertakings in England give figures from which it is possible to calculate the cost of their steam, but this is not a fair comparison, as such concerns need much reserve in the form of boilers standing-by under steam to meet their peak-loads and to allow for fogs. For this reason a public electricity station is far less efficient economically than that of a chemical works which has a steady load.

As the obtaining of a standard market price for steam appears so difficult, an alternative would be to obtain a standard cost, and if owners of modern well-equipped and efficiently run boiler houses would give detailed information concerning their steam costs, a valuable standard could be set up, and the economically inefficient plants would soon find out their shortcomings, and would set their houses in order with a consequent reduction of manufacturing costs all round.

It is in the hope of other concerns following their example that the Directors of William Walker and Sons, Ltd., of Bolton, permit the publication, of the accompanying steam production costs of their boiler house, which was only just completed and in working order before the General and Coal Strikes. The figures are not put forward in any sense as an example of efficiency, but to serve as a basis for discussion to obtain a standard method of showing such statistics and to bring forward similar figures from others.

BRITISH STANDARD SPECIFICATIONS

The British Engineering Standards Association has issued British Standard Specification No. 261 1926 for Ready Mixed Linseed Oil Paint (Oil Gloss), Genuine White Lead; No. 262—1926 for Ready Mixed Linseed Oil Paint (Oil Gloss), Tinted Paints (White Lead Base); No. 272—1926 for Red Oxides of Iron (Class 1, Natural or Mixed Iron Oxides) for Paints; No. 273—1926 for Zinc Oxide Oil Paste for Paints; and No. 274—1926 for Extra Hard Drying Varnish. The specifications contain clauses regulating the composition, together with standard reception tests, for the purchase of these materials, together with appendices giving methods of carrying out the tests. These specifications have been prepared at the request of the paint manufacturers by a committee representative of both the buying and manufacturing interests, and, as in the case of all British Standard Specifications, they will be reviewed as experience of their working or progress in the industry renders it necessary, and revised issues will be published from time to time. Other specifications dealing with red oxide of iron oil paste (Classes 1 and 2), lead chromes, Prussian blues, lithopone, lithopone oil paste, carbon black, gold size, zinc oxide, and tinted zinc oxide ready-mixed paint are in course of preparation. Copies of the new specifications (Nos. 261, 262, 272, 273 and 274—1926) can be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, S.W.1, price 2s. 2d. each, post free.

THE SUGAR INDUSTRY IN SOME OF ITS CHEMICAL ASPECTS*

By DR. C. A. BROWNE†

Probably no other food commodity has had so strong a fascination for the economist, the agriculturist, the chemist, and the engineer as sugar. In the first place, no other food product has been so frequently subjected to tariff laws, bounties, cartels, and other regulations. In the second place, the operations of producing sugar cane and sugar beets are the best examples of a system of agriculture which, although highly specialised, is probably unrivalled in the extent and complexity of its relations. In the third place, sugar is the only food commodity which is supplied to the consumer in a state of complete chemical purity, the removal of the last traces of contaminating material thus acting as a continuous challenge to the ingenuity of the chemist. Lastly, the numerous operations of sugar manufacture present a greater variety of attractive problems to the engineer than is offered by any other branch of industry. Chemists distinguished in other fields, like Sir William Crookes, have gone out of their way to write treatises upon sugar manufacture, and engineers distinguished in other fields, such as Sir Henry Bessemer, have gone out of their way to invent new machinery for the extraction of sugar. Important epoch-making appliances, like the vacuum pan and multiple effect, now used extensively in all branches of applied chemistry, found their first industrial application in the manufacture of sugar.

Engineers and chemists have too often neglected the agricultural side of sugar production. The costs of planting, cultivating, fertilising, and harvesting make up over two-thirds of the total cost of a pound of sugar, thus leaving less than one-third for the expenses of manufacture. Sight has often been lost of the fact that the cane or beet plant is the real sugar factory, the extraction, evaporating, and crystallising equipment being simply the means of separating the sugar that nature had already produced. The neglect of the more important agricultural chemical processes in the field, where the sugar is synthesised by the plant from its elementary constituents, is of far greater moment than an attitude of indifference to the chemistry of factory operations.

THE SOIL AND THE CROP

Chemistry assists the agriculture of sugar production in determining the character of soils and fertilisers, the varieties of crops, and the conditions of cultivating and harvesting which are best suited for obtaining a maximum yield of sugar per acre. Surprisingly little attention has been given to the soil when selecting the sites of some tropical sugar plantations. A newly created plantation in the West Indies with a most expensive modern factory equipment was brought to the verge of ruin through failure to determine in advance the character of the land. The soil proved to be very salty, with the consequence that the sugar cane grown upon it yielded juices of extremely low purity, and so heavily charged with soluble chlorides that profitable sugar manufacture was almost impossible. Extensive drainage has been required to

* Read before the Montreal Section on January 18, 1926

† Chief, Bureau of Chemistry, U.S. Dept. of Agriculture

free the fields of this plantation from their excess of salts, and to bring them into a condition suitable for successful sugar production. A preliminary survey of the undeveloped land by an agricultural chemist would have prevented the initiation of such a costly mistake.

The proper treatment of soils where there is a dangerous accumulation of soluble salts is a problem which the growers of sugar crops (both the cane and the beet) must occasionally consider. In the alluvial cane lands of Demerara Mr. Maurice Bird has found the soil solution to contain at times over 1% of soluble mineral matter, consisting of the chlorides, sulphates, and carbonates of sodium, potassium, calcium, and magnesium, which tend to accumulate in the surface soil as a result of capillarity and evaporation. This enormous excess, due partly to the concentration of soil water during protracted droughts, may result in serious damage to the growing crop by causing a diseased condition of the cane known as withering. The dissolved magnesium salts are particularly toxic to the cane unless their influence is counterbalanced by the favouring action of sufficient calcium bicarbonate, for producing which a rich supply of decomposing organic matter is needed in the soil in order to supply the necessary carbon dioxide.

In order to facilitate the removal of salts from defective cane lands it is sometimes advantageous to break up the subsoil to provide better drainage. Periodic flooding of the land is also beneficial. The chemical processes of oxidation, hydration, and nitrification advance with great rapidity in tropical soils, the elements of plant food being made available in a much shorter period than in temperate zones. This would be a great advantage were it not that the forces which impair fertility are equally rapid. As one result of these chemical changes the soils of the heavy clay sugar lands in Demerara become markedly alkaline during cultivation, a condition made evident to the eye by the solution of humus which colours the drainage waters a dark brown. It is imperative for the maintenance of fertility that the organic matter removed by oxidation and leaching be fully restored.

A peculiarity of Demerara sugar cane juices and sugar products, to which Professor Francis, the former Government analyst in British Guiana, called attention forty years ago, is the low optical activity of the reducing sugars. I discussed this interesting question, when I visited Demerara seven years ago, with Sir John Harrison and other scientists. Mr. Maurice Bird attributes the phenomenon to the alkaline condition of Demerara soils, the effect of dilute alkali being to bring the polarizing power of a mixture of reducing sugars to the point of inactivity. Owing to this characteristic of Demerara raw sugars, some refiners, because of the loss of the favourable differential between direct polarisation and sucrose content, which with the raw cane sugar of other countries amounts to several tenths of one per cent., have held that it was less profitable to refine sugars from this colony. The high purity of the Demerara raw sugars, however, nullifies this apparent disadvantage, which, it should be stated, is not equally pronounced at all seasons.

The value of chemical analyses of soils as a means of determining their toxicity is generally unquestioned,

but there is a wide difference of opinion as to the value of such analyses as a means of determining the manurial requirements of a sugar crop. So many factors enter into the question that deductions from soil analyses in one location do not apply to similar analyses in a different environment. It may be said, however, that for a given region of similar agricultural and climatic conditions, soil analyses, when made in conjunction with carefully conducted field experiments over a period of years, make possible the formulation of certain general conclusions as to fertiliser requirements. Thus in Hawaii it has been observed that if the amount of P_2O_5 dissolved from a soil by a 1% citric acid solution exceeds 0.004% with an accompanying quantity of 0.15% soluble lime and silica, no response is obtained when phosphatic fertilisers are applied to sugar cane. In the same way it has been observed that soils with a citric acid soluble potash content above 0.03% and a fair amount of accompanying soluble lime do not generally give increased yields of sugar cane with applications of potash fertilisers.

THE NEED FOR NEW VARIETIES

While the production of new varieties of sugar cane and sugar beets is a subject that falls within the realm of plant breeding, the selection of the particular variety of best composition for sugar production devolves largely upon the chemist. The need of constantly improving the existing varieties of our sugar producing crops is always dominant. Certain established varieties may give good returns for hundreds of years, and then show a sudden degeneration from failure to resist new diseases. Thus the old Bourbon variety of sugar cane, which for centuries had been the chief source of the world's sugar supply, began to decline in vigour about forty years ago, and to succumb to the attacks of fungous diseases. The yields of cane fell off enormously, and the sugar industry of the West Indies would have been ruined had Harrison and Bovell, in Barbados, not discovered at this time the fertility of sugar cane seed, thus opening the way to the production of new varieties that were resistant to fungous disease. But now another malady of the sugar cane, the mosaic disease, has appeared, and, as the fungus-resisting canes are not immune to this new enemy, there has arisen an urgent demand for hardier varieties. Considerable success has already been obtained in producing canes which are resistant to disease and cold. During the past five years the Louisiana Experiment Station has been conducting experiments upon the growing of sugar beets in different parts of the State. The results of the preliminary work indicate that beets planted in November are ready for harvesting the following May, with a yield of about 20 tons of roots to the acre, a sugar content of 12.5%, and a purity of over 84. If a beet crop can be harvested in Louisiana in May—June, and a cane crop in November—December, the economic losses from idle factory equipment will be greatly reduced.

SOURCES OF LOSS

One of the most serious chemical losses in both the sugar cane and sugar beet industry is the destruction of sucrose in the crop between the time of harvest and manufacture. This loss may result from the inverting action of enzymes after the cane has been cut, or from

the fermentation of the crop as a result of injury by freezing, insects, and other causes, or from the natural processes of cellular respiration which take place in all stored plant materials. In the tropics, where sugar cane is sometimes transported long distances, a week or more may elapse between the times of cutting and milling, with the result that under the favourable conditions for bacterial growth the stalks reach the mill in a state of deterioration, the expressed juice being sour and slimy from the presence of acid and gummy decomposition products. The clarification of such juices gives the factory chemist a vast amount of trouble. With very badly fermented cane, sugar making is an impossibility: working up the juice into industrial alcohol is the only hope of salvaging anything from the wreck.

It has been estimated that the actual destruction of sucrose from cellular respiration during the storage of sugar beets, between digging and slicing, amounts each year in the United States to \$5,000,000, and that another \$5,000,000 loss occurs in the factory owing to the inability to recover as much sugar because of the accumulation of objectionable nonsugars which have been rendered soluble by metabolic changes in the beets during storage.

The saving of the immense losses which result each year from the deterioration of sugar cane and sugar beets has long engaged the attention of chemists. Immediate dehydration of the sliced stalks and roots has been proposed, the advocates of this scheme holding that among other advantages the dried material can be pressed into bales and preserved for an indefinite period before being worked up for sugar, thus enabling the sugar factories to operate all the year instead of for only a few months as at present. The insufficient margin of profit in dehydrating sugar cane and sugar beets at the present high cost of fuel and low selling price of sugar has been the most serious obstacle to this process of sugar manufacture.

PLANT

Leaving now the agricultural side of our topic, it remains to discuss raw sugar manufacture in some of its chemical aspects. Manufacturers of sugar have probably been more imposed upon by the purchase of undeveloped and impracticable patented processes and appliances than have those of any other product. It is instructive to visit the sugar factories in Cuba and other tropical countries, and to note the expensive equipment discarded after a brief period of use as uneconomical or useless.

The sugar planter has always shown willingness to adopt any suggested improvement, whether it be a new appliance, such as a filter press or evaporator, or whether it be an entirely new process of manufacture. When the new scheme is backed by capital and well-organised propaganda, the isolated manufacturer is almost helpless if he desires to ascertain the disadvantages of the proposed innovation. Trade publications, whose columns should be thrown open to a free discussion of the pros and cons of every process, are rarely useful in such an emergency. What is needed is a forum of open public discussion in which both the successful and unsuccessful users of the process can state their experi-

ence, for it is only upon the basis of widely disseminated experience that progress can be made. Too often in cases of this kind the purchaser has been sold a problem instead of a well-developed process. Many engineering chemists can no doubt recall in their own fields instances of a hastily exploited device in which the basic principle was sound, but the mechanical or technical development was so imperfect that after it had been tried upon the manufacturing public the original appliance had to be entirely changed.

One thing which always impressed me, during my occasional visits to tropical plantations, was the wonderful durability of the old British sugar-house machinery. I have seen in operation walking beam engines and other appliances that have been in constant use for over 80 years. In commenting once to Sir Francis Watts, the former Imperial Commissioner of Agriculture in the West Indies, upon the excellent lasting quality of this old Scotch and English sugar-house equipment, he remarked jokingly that it was too good, as the purchase of machinery which will never wear out, and which its owner, therefore, will never care to replace, is not always the best economy. Indeed, some hold that the building of appliances to last for more than 20 years is an extravagance, as new, more economical devices which have been perfected should then be installed in their place without further delay. Machinery built for a short existence, however, has the frequent defect of structural weakness, and the heavy over-burden, which sugar making equipment must sometimes bear, demands the most durable kind of construction. This is particularly true in the case of sugar mills, which in grinding the new mosaic-resisting varieties of cane with high fibre content are subjected to enormous strains, far exceeding anything that the designers of these mills imagined.

The tendency of late years has been towards increasing the crushing, shredding, and rolling capacity of sugar cane mills. This is largely due to the desire for better sugar extraction, but it is also partly the result of an effort to obtain a more closely matted blanket of bagasse for retaining the clarification mud, which in certain processes of manufacture is pressed out between the rollers of the mill. High pressure crushing and milling, however, has brought in its train a number of disadvantages. Much of the bagasse is reduced to a fibrous powder, which finds its way through to the final sugar, and by its moisture retaining capacity exerts an undesirable influence upon the keeping quality of the product. High milling also removes more of the gums and other colloidal impurities of the cane, thereby increasing the difficulties of clarification.

COLLOIDAL IMPURITIES

The U.S. Bureau of Chemistry during the past few years has devoted considerable study to the colloidal impurities of sugar cane and sugar beet juices, the removal of which is the most fundamental process in sugar manufacture. The accurate determination of all the colloidal impurities in juices, syrups, molasses, massecuites, and sugars is a somewhat difficult procedure. The Bureau of Chemistry has employed ultrafiltration by means of standardised collodion membranes as the most suitable means of separating colloids for quantitative determination.

These membranes will retain not only all the material which is held by the filters of the sugar factory, but also the minutely divided colloidal particles that pass through. The results of such determinations upon the successive washings of different sugars showed that the colloidal impurities were distributed rather evenly throughout the crystals, which would indicate a continuous adsorption of impurities of this type upon the surface of the growing crystals while in the vacuum pan. It is evident that no manner of washing a sugar in the factory centrifugals will free it from the contaminating colloidal impurities.

The "water soluble" colloidal fraction from one sugar sample examined by the Bureau of Chemistry was found to have a specific rotation of -36° , which is approximately the value for the specific rotation of a gum prepared at the Bureau by Paine and Walton by dialysing beet molasses. This gummy impurity of the sugar did not reduce Fehling solution until after hydrolysis by hydrochloric acid. This indicates that it is a polysaccharide, probably extracted from the beets in the process of diffusion.

The presence of uneliminated colloidal impurities is not only responsible for various sugar factory difficulties, such as poor filtration, bad vacuum-pan boiling, and delayed crystallisation, but it is also a most common cause of off-colour sugar. These impurities may be of an inorganic as well as of an organic nature. In Demerara much colloidal silica finds its way from the soil into the cane juices and causes trouble in the factory by interfering with the clarification and by producing scale upon the coils of the evaporators. Superheating the juice before clarifying with lime has been found to eliminate much of this colloidal silica, and to cause a marked improvement in the yield and quality of the raw sugar produced.

The liming of juices for clarification has for centuries been one of the most important steps in sugar manufacture, yet until very recently but little effort has been made to place the control of this operation upon a strictly scientific basis. Owing to the well-known destructive action of alkalis upon reducing sugars, with the formation of dark decomposition products, great care is needed in the application of lime to sugar-cane juices. The theoretical quantity of lime for neutralising the free acid in a given quantity of cane juice may be measured, but, because of imperfect facilities and the lack of opportunity for a rapid intermixing of lime and juice, there may occur local zones of liquid that are over- and under-limed. Thus considerable damage may result from the destruction of reducing sugars at one instant by over-liming and from the inversion of sucrose at the next instant by under-liming.

Owing to the fact that the juices expressed from the cane are of constantly varying acidity, it has been impossible to devise a perfectly satisfactory continuous method of liming. The operator who tests the reaction of the juice with phenolphthalein at given intervals may obtain an average ratio of lime for a given flow of uniform juice that is fairly satisfactory, but if the reaction or rate of flow of the juice should suddenly change he may not detect the difference of conditions in time to prevent damage.

To correct the defects of this system of control the Bureau of Chemistry recently conducted experiments in Porto Rico upon continuous electrometer p_H measurements of cane juices by means of an automatic recorder. It was found possible by means of this device to detect rapid fluctuations in the reactions of juices which were not revealed by the intermittent methods of measurement, whether by titration or by p_H determination. With the reading of the automatic recorder constantly before him, the operator was able to adjust the lime control the instant a change in the reaction of the juices was indicated. The results obtained by the use of this new instrument were exceedingly favourable, the extreme fluctuations in reaction, due to temporary or local over-liming and underliming, disappearing. The existence of a continuous permanent record of the daily juice reactions is also of value to the factory superintendent for reference. The next obvious step in clarification control will be an extension of the automatic recorder to an automatic device for regulating the addition of lime to the juice. In fact, the accomplishment of this ideal is well on the way to realisation.

The recent war gave an impetus to the manufacture of white sugar on tropical plantations. Some enthusiasts predicted that in a very few years all the cane-sugar refineries of the world would have to go out of business, since they deemed it far more economical to make white sugar right where the cane was grown. This prophecy has never been realised for the reason that no plantation has yet found it possible to manufacture white sugars equal in purity and uniformity of grade to refined sugars. Notwithstanding, however, the failure of the prediction regarding the expansion of the tropical white sugar industry, there has been a vast improvement since the war in the quality of the raw sugars produced upon cane plantations.

This improvement in the purity of plantation raw sugars has not, however, always been accompanied by an improvement in keeping quality, which is a characteristic of the utmost importance when the output of a factory has to be stored over long periods of time. The keeping quality of a sugar is conditioned by two factors—the moisture content and the purity. Sugars of high purity and high moisture content deteriorate very rapidly as a result of the activity of yeasts, moulds, and other micro-organisms. The higher the percentage of soluble impurities in a sugar, the greater the amount of moisture it can retain without danger of deterioration. Various tables and rules have been devised for predicting the keeping quality of a sugar. The best known of these is the so-called "factor-of-safety" rule of the Colonial Sugar Refining Company of Australia, according to which the moisture of a sugar must not exceed one-half the non-sugar if the product is to keep. Experiments conducted over a long period of years at the New York Sugar Trade Laboratory upon raw cane sugars of West Indian origin showed that the moisture should not exceed one-third the non-sugar. This is now the generally accepted figure.

But like all other rules the "factor-of-safety" formula must be intelligently applied. A sugar conforming to the requirements of the formula will not deteriorate only so long as there is no disturbance in

the even distribution of its moisture. Let there be, for example, an uneven distribution of temperature in the sugar, and the moisture will be forced to migrate from the warmer to the cooler portion of the mass. There will then be produced zones of sugar with a moisture content above that prescribed by the safety factor, and in these places deterioration will at once begin.

The risk of moisture migration in stored sugar increases with the size of the containing parcels. Smaller packages offer a proportionately larger radiating surface for the same weight of sugar than bigger ones, and hence tend to hold the mass at a more uniform temperature, with less probability of dangerous high moisture regions being formed. It is for this reason that the storing and shipping of raw sugar in large bulk is a hazardous proposition.

Several instances have been recorded where the deterioration of raw sugars proceeded so rapidly that spontaneous combustion of the product took place with almost explosive violence. The evolution of so much heat, far exceeding the tolerance of the most resistant micro-organisms, is difficult to explain. The first stages of the process are unquestionably fermentative. During this phase the product may reach a temperature of 70° or 80°, which approaches the thermal death-point of the organisms involved. The second stages of the process, when the temperature mounts rapidly upward to the point of ignition, are of a vastly different character. Whether this results from the rapid oxidation of some unsaturated fermentation product, from the sudden decomposition of some unstable endothermic compound produced under anaerobic conditions, from the effect of some highly reactive catalytic agent, or from some violent exothermic reaction of an unknown character is a matter upon which at the present time we can only speculate.

Spontaneous decompositions very similar to fermentations may take place in concentrated syrups and molasses under absolutely sterile conditions. For twelve years I have had under observation several samples of molasses that have undergone a slow inversion of sucrose, a gradual destruction of reducing sugars, and a slight evolution of gas, with a constantly increasing darkening of colour. Bacteriological examinations have failed to give positive indications of the presence of yeasts or other organisms. The change seems to be a subdued example of the old hot room froth fermentation, which is not bacterial, and is now attributed by some investigators to a reaction between amino acids and reducing sugars. It is known that under favourable conditions this so-called froth fermentation of molasses may proceed violently, with the evolution of a large volume of gas and enough heat to carbonise the entire contents of the tank.

THE SUGAR INDUSTRY

The application of strict scientific principles has been followed more energetically in beet sugar manufacture than in cane sugar manufacture. This we would expect, for the beet industry was developed in the highly civilised European countries, where skilled labour was abundant, and the cane industry was maintained in

primitive tropical countries, where labour was shiftless and unskilled. In 1852, taking the whole supply of the world, six times as much cane sugar as beet sugar was manufactured. Beet sugar kept gaining, however, until by 1884 the production of the two kinds of sugar was about equal, a little over 2,500,000 tons each. Beet sugar then took the lead, until in 1899 its production was about 5,500,000 tons, against a cane sugar production of about 3,000,000 tons. Then came the ending of the Cuban war, and with it the application of the scientific principles worked out for the beet industry to the dilapidated cane factories of Cuba and Porto Rico. Modern methods of manufacture had also been busy reorganising the cane industry in Hawaii, Java, Australia, and other countries. The production of beet sugar in 1901 reached nearly 7,000,000 tons, and since then has remained practically stationary. But the increase in cane sugar production, however, has gone forward each year by leaps and bounds. In 1907 the cane had caught up to the beet, the production of each kind being a little over 7,000,000 tons. In 1908 cane sugar was over 600,000 tons ahead, and in 1909 nearly 2,000,000 tons ahead, out of a total world's production of about 15,000,000 tons.

During the World War the beet sugar industry of France, Belgium, and other European countries suffered a serious set-back, large fertile sugar beet areas having been within the zone of conflict and many hundreds of factories destroyed. In order to make up the deficiency thus caused in the world's sugar supply, a great impetus was given to the cane sugar industry of the tropics. At the close of the war the total production of the world's beet sugar had fallen to 3,259,380 tons, while that of cane sugar had advanced to 11,957,232 tons, over 78% of the entire sugar production. Since 1919 the beet sugar industry of Europe has been rapidly recovering, the total production of the world's beet sugar for the present crop year (1925—1926) being 8,287,000 tons, which is 33.9% of the entire sugar production of the world (24,398,214 tons).

The future development of the world's sugar industry will probably be more extensively confined to sugar-cane growing countries. This is due principally to the lower cost of producing cane sugar, because of the cheaper labour of tropical countries, and the much greater yield of sugar per acre which the cane gives over the beet. Under the best systems of cultivation and manufacture, such as are found in Hawaii and Java, more than four tons of sugar can be produced per acre. Germany, which leads in the production and yield of beet sugar, can raise barely two tons of sugar per acre. Yet notwithstanding the natural advantages possessed by the sugar cane, the production of beet sugar is bound to increase for many years to come. The sugar beet, as a root-producing plant of deep-feeding character, plays a most beneficial part in the systems of crop-rotation which are best suited to diversified farming. It is a crop which from the standpoint of both agriculture and national economy should always meet with the most favourable consideration in countries which, like the United States and Canada, are climatically suited to its best development.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

TAR CONFERENCE PAPERS

The Papers that were presented before the Manchester Tar Conference in November last, together with the full discussion, will be published in bound form towards the end of this month, at the price of 2s. 6d., post free.

* It was felt that the contributions proved so valuable that many of those interested would like to retain, for immediate reference, a complete account of what transpired at the Conference.

A limited number of copies will be available. It is consequently advisable for any who require copies to apply to the General Secretary of the Society of Chemical Industry, Central House, Finsbury Square, London, E.C.2, at once. Orders should be accompanied by the appropriate remittance.

CONGRESS OF CHEMISTS HANDBOOK

This Handbook, which has been prepared by the Committee of the Congress under the Editorship of Mr. W. H. Coleman, contains, in addition to a full programme of the meetings, an account of some of the more important chemical and allied industries in and around London. A useful map of Central London accompanies it. A copy of the book was presented to every member attending the Congress, but a considerable number of copies is still on hand, and the General Secretary will be pleased to send one to any member who was not present at the Congress, on receiving his name and address, with 6d. in stamps to cover the postage.

BRISTOL SECTION

At a meeting held at the University on January 6, Prof. Francis presided over an excellent attendance. After apologising for the absence of the chairman through indisposition, Prof. Francis introduced Mr. Geo. Hider, M.I.M.E., A.M.Inst.C.E., of Swansea, who read a paper on "Water softening."

Mr. Hider treated the subject from the standpoint of the engineer, and illustrated his remarks by a series of excellent lantern slides. It was stated that natural water always contains salts in solution: hardness-forming salts, and easily soluble salts which are not precipitated even when the water is boiled under pressure. With the advent of steam boilers, troubles arose from these salts, which deposited on heating surfaces and also caused undesirable concentrations. It was found that water could be partially softened by adding lime, and more completely by adding soda also. Many "lime and soda" plants were thus produced, but, even with the best attendance, these could not entirely prevent scale and sludge in the boiler, and blowing-off to waste was also necessary to prevent high density.

Trouble was experienced with soda concentration if enough of this substance was added to remove all the permanent hardness. Zeolite softeners were then introduced, and they did produce zero hardness, a condition which, however, had serious disadvantages well known to engineers. A means of controlling the quality of the water in the boilers was evidently essential for a solution of the problem, and, after much experiment and research,

a scheme was developed, now known as the "Neckar" system of water treatment and boiler control. In this system the water is abstracted continuously from the boilers to prevent concentrations of all kinds, the water being returned to the softener.

The lecture produced an excellent discussion, in which Messrs. Marsden, Andrews, Rixon, Shackel and others took part. A hearty vote of thanks was accorded to Mr. Hider.

CALENDAR OF FORTHCOMING EVENTS

- Jan. 15. NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS. The Mining Institute, Neville Hall, Newcastle-upon-Tyne, at 3 p.m. "Dry cleaning of coal," by J. S. Carson.
- Jan. 17. INSTITUTION OF THE RUBBER INDUSTRY. Sales Section. Engineers' Club, Coventry Street, W.1. "Retail selling," by H. G. Selfridge, junr.
- Jan. 17. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. (Cantor Lecture 1). "Recent progress in optics," by Prof. L. C. Martin. (Also on Jan. 24.)
- Jan. 18. INSTITUTE OF BREWING, Scottish Section. Caledonian Station Hotel, Edinburgh. "Beer from the brewery to the consumer," by J. Carmichael.
- Jan. 18. HULL CHEMICAL AND ENGINEERING SOCIETY. Hull Photographic Society's Rooms, Grey Street, Park Street, Hull, at 7.45 p.m. "The Lodge-Cottrell electrical precipitation process," by H. W. C. Henderson.
- Jan. 18, 19. SOCIETY OF GLASS TECHNOLOGY. College of Technology, Manchester, on January 18, at 2.30 p.m. (1) "The effect of cullet on the melting of glass," by Prof. W. E. S. Turner. (2) "Investigation of the glassy state by the method of forced crystallisation," by Prof. J. F. Ponomareff. (3) "The durability of some soda-lime magnesia glasses," by V. Dumbleby and Prof. W. E. S. Turner. (4) "The thermal expansions of some borate containing glasses," by Prof. W. E. S. Turner and F. Winks. On Wednesday, January 19, a visit will be paid to the Manchester Ship Canal at 10.0 a.m. Luncheon will be taken in the Grand Hotel, Manchester, at 1 p.m., and at 2.30 p.m. a Conference will begin, when two addresses will be given—"The present position of the glass industry in Germany," by Prof. W. E. S. Turner, and "Developments in the glass industry in Russia," by Prof. J. F. Ponomareff.
- Jan. 19. INSTITUTE OF CHEMISTRY, Bristol and S.W. Counties Section. The University, Woodland Road, Bristol, at 7.30 p.m. "Researches on the nutrition of fruit trees," by T. Wallace. Members of the Society of Chemical Industry are invited to attend.
- Jan. 19. INSTITUTION OF CIVIL ENGINEERS, Students' Meeting. Great George Street, Westminster, S.W.1, at 6.30 p.m. "The testing of heat engines," by H. R. J. Burstall.
- Jan. 19. INSTITUTE OF CHEMISTRY, London and South Eastern Counties Section. Visit to the Government Laboratory, Clement's Inn Passage, Strand, W.C.2. Tea will be served at the Laboratory before the visit at 4.30 p.m.
- Jan. 19. SOCIETY OF GLASS TECHNOLOGY. Meeting in Manchester.

- Jan. 19. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. (Ordinary Meeting). "Development of the petroleum industry in Persia," by Sir John Cadman. The Rt. Hon. Viscount Inchcape will preside.
- Jan. 19. ELECTROPLATERS' AND DEPOSITORS' TECHNICAL SOCIETY, Northampton Polytechnic Institute, St. John Street, Clerkenwell, E.C.1, at 8.15 p.m. "Electrodeposited coatings for prevention of corrosion," by H. Sutton.
- Jan. 20. UNIVERSITY OF LONDON, University College, Gower Street, London, W.C.1, at 5 p.m. "The biological action of light," by Dr. D. T. Harris. (Also on Jan. 27.)
- Jan. 20. CHEMICAL SOCIETY, Burlington House, Piccadilly, W.1, at 8 p.m. *Ordinary Scientific Meeting.*
 (1) "The glow of arsenic," by H. J. Emeléus.
 (2) "On the origin of the spectrum of the glow of phosphorus," by H. J. Emeléus and R. H. Purcell.
- Jan. 20. BIRMINGHAM METALLURGICAL SOCIETY, Engineers' Club, Waterloo Street, Birmingham, at 7 p.m. (Arranged by the Co-ordinating Committee.) "Refractories," by Prof. W. G. Fearnside.
- Jan. 20. INSTITUTION OF MINING AND METALLURGY, General Meeting, Burlington House, Piccadilly, W.1.
- Jan. 20. SOCIETY OF CHEMICAL INDUSTRY AND INSTITUTE OF CHEMISTRY, *Edinburgh and East of Scotland Sections. Joint Meeting.* The Pharmaceutical Hall, 36, York Place, Edinburgh, at 7.30 p.m. "The importance of fuel research in the coal problem," by Dr. C. H. Lander.
- Jan. 21. INSTITUTION OF MECHANICAL ENGINEERS, Storey's Gate, St. James's Park, London, S.W.1, at 6 p.m. "Use and economy of high-pressure steam plants," by Prof. A. L. Mellanby and Prof. W. Kerr.
- Jan. 21. SOCIETY OF CHEMICAL INDUSTRY, *Liverpool Section.* The University, Liverpool, at 6 p.m. "Some physico-chemical and bio-chemical aspects of malignant growths," by Prof. W. C. McC. Lewis.
- Jan. 21. SOCIETY OF DYERS & COLOURISTS, *Manchester Section.* 36, George Street, Manchester, at 7 p.m. "Modern industrial chemistry," by R. S. Horsfall.
- Jan. 21. SOCIETY OF CHEMICAL INDUSTRY AND INSTITUTE OF CHEMISTRY, *Glasgow and West of Scotland Sections.* Engineers' and Shipbuilders' Institute, 39, Elmbank Crescent, Glasgow, at 7 p.m. "The volatility and carbonisation of oils for cylinder lubrication," by J. W. Donaldson.
- Jan. 22. SOCIETY OF CHEMICAL INDUSTRY, *Birmingham and Midland Section.* Annual Dinner.
- Jan. 22. SOCIETY OF CHEMICAL INDUSTRY AND INSTITUTE OF CHEMISTRY, *Birmingham and Midland Sections.* Chemists' Dinner. The Queen's Hotel, Birmingham, at 7 p.m. The guests will include the President of the Institute of Chemistry, Prof. G. G. Henderson, and the President of the Society of Chemical Industry, Mr. F. H. Carr, C.B.E.
- Jan. 24. INSTITUTE OF CHEMISTRY, *Leeds Area Local Section.* "The training of the fuel chemist," by Prof. J. W. Cobb.
- Jan. 25. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 4.30 p.m. "The sugar resources of the British Empire," by B. H. Morgan.
- Jan. 26. SOCIETY OF CHEMICAL INDUSTRY, *South Wales Section.* University College, Singleton Park, Swansea. "Quantitative spectrographic analysis," by Capt. J. R. Green.

CORRESPONDENCE

PHARMACISTS AND CHEMICAL ANALYSIS

SIR,—May I use the hospitality of your columns to draw attention to certain curious statements which have been made (apparently in all seriousness) by a pharmacist, which may be of interest and amusement to your readers. "Chemical analysis as a science has been framed and developed by pharmacists, and it remains to this very day the main part of a pharmacist's training and occupation. . . . Ever since analysis has been practised it has been the pharmacist's chief occupation, and it is a job only for pharmacists"

Yours etc.,
R. F. HUNTER

SPACE FORMULÆ

SIR,—You have several times asked for information about space formulæ. By the time you have read to the end of this letter, I think you will realise more about the subject; you can hardly know much about it, otherwise you would not have written so light-heartedly about it; a fluent pen hardly compensates for lack of knowledge.

Suppose you want a space formula on the lines of the usual pictures of crystals; these are all drawn on a conventional plan; you assume you are looking slightly down on to the crystal. If you look slightly down on to a circle it looks like an ellipse. In the cubic system,

Fig. 1

which is the easiest to begin with, and to which the tetrahedral carbon atoms belong, you must draw a circle in which two axes are diameters and draw a vertical line to represent the third vertical axis (Fig. 1); if

CC' represents the vertical axis, the ellipse will give the appearance of the circle, and the two axes AA' and BB' will become aa' and bb' in the ellipse. The small diameter of the ellipse is one-sixth of the diameter of the circle, and every vertical chord of the ellipse is one-sixth of the corresponding vertical chord of the circle. This gives you the correct ellipse for the conventional angle for the elevation of the eye $9^\circ 28'$. The conventional

FIG. 2

position of the two axes AA' and BB' is that shown in the diagram, and is such that AN is one-third of ON . The vertical axis is not foreshortened, and is therefore equal to the diameter of the circle. By joining the ends of the axes you get a projection of the octohedron. If you bisect the edges of the octohedron and draw lines through the points of bisection parallel to the axes you will get points which give you the rhombic dodecahedron (Fig. 2). In other ways you may draw the cube and all other forms of the cubic crystal. Similarly by drawing the axes of copper sulphate which belongs to the triclinic system, you can get proper pictures of its crystals (Figs. 3 and 4). Now let us choose a simple organic compound like acetic acid; you want two tetrahedra representing the two carbon atoms connected by the apex of each tetrahedron. Draw your vertical axis CC' , your circle, and your ellipse. Draw an equilateral

Axes of copper sulphate

FIG. 3

triangle in your circle ABC , its projection in the ellipse will give you its appearance in the drawing (Fig. 5). To get the height of this tetrahedron bisect AB in D and CB in E . Join CD and EA , cutting each other in F , the centre of the circle. If h is the height of a tetrahedron standing on its base $h^2 + FD^2 = CD^2$. On

CD describe a semi-circle, and with D as centre and DF as radius describe a circle cutting the semi-circle in G .

Copper sulphate

FIG. 4

CG is the height of the tetrahedron; set off this length on the axis of CC' , making $OM = CG$ and complete the

FIG. 5

drawing of your tetrahedron. By calculation or geometry you can find the point N such that N is equidistant from

the corners of the tetrahedron; this is where the nucleus of the carbon atom is situated and ON is a quarter of OM. Draw another tetrahedron at the bottom, as in Fig. 6; if you assume the bottom atom is free to rotate

R and T, oxygen V, hydrogen

FIG. 6

about the CC' axis, it is immaterial how you arrange the corners; if you assume any constant position for them, draw them accordingly; it will not be very easy for anyone to prove you are wrong. To place the centres of the hydrogen atoms joined on to the top carbon atom, draw lines Ne, Nf and Ng. You can assume the volume of a hydrogen atom is a quarter that of the carbon atom if you like, no one can prove it is not so. In that case

if H represents the hydrogen nucleus $\frac{Hc}{Ne} = \frac{1}{\sqrt[3]{4}}$ and so

on for the other two corners. When you come to the COOH part of the picture, you can get your carbon atom nucleus, and assume that the one oxygen atom is symmetrically placed, i.e., its centre is along the line PQR. You have to assume the size of the oxygen atom and draw it in accordance with your assumption; personally, I assume that it is not a sphere in this particular compound, but is more the shape of a bolster; it does not matter, no one can prove it yet. I put its centre at R, where $\frac{QR}{PQ} = \frac{1}{\sqrt[3]{4}}$. As to the hydroxyl

group, I put the centre of the oxygen atom at T, where $\frac{ST}{SP} = \frac{1}{\sqrt[3]{4}}$, and I put the centre of the hydrogen atom at V, where VW is equal to ST. If you accept the principle of close-packing, a few minor adjustments must be made, but they are so small as to be hardly noticeable on drawings of this size. Sir, take a piece

of paper and a wet towel and sit down to a little geometry. Draw yourself a projection of a molecule of camphor or iodoform, and see how many assumptions you have to make, and how long it takes you to make them, and whether the result is worth the trouble. You may learn a little geometry in the process; anyway, you will learn not to write any more editorials asking chemists to supply you with space formulae.

Yours, etc.,

E. MURGATROYD

PERSONAL AND OTHER ITEMS

Sir Harry McGowan, Lieut.-Col. Pollitt, and Mr. B. E. Todhunter have been added to the Board of International Combustion, Limited.

Dr. P. Hartley has been awarded the William Julius Mickle Fellowship of the University of London for 1927 in respect of the work he has carried out for the past five years on problems of serology and immunity.

We regret that in our extract from the New Year Honours List we omitted the name of Dr. H. T. Tizard, F.R.S., the Principal Assistant Secretary to the Department of Scientific and Industrial Research, who becomes a C.B.

Dr. George McOwan, M.A., B.Sc., Ph.D., lecturer in chemistry in the United College of St. Salvator and St. Leonard, University of St. Andrew, has been appointed reader in chemistry at Raffles College, Singapore.

Mr. A. E. Marshall, consulting chemical engineer, who was recently elected president of the Association of Chemical Equipment Makers in the United States, was born in Liverpool, England. For a time he was a plant superintendent with the United Alkali Co., Ltd., and later joined the Thermal Syndicate, going to New York in 1912 as manager for the Thermal Syndicate of New York. Since 1921 he has been engaged in consulting work.

The American Petroleum Institute has granted \$4,000 to Johns Hopkins University for use in research, with the object of establishing scientific methods for the identification of sulphur compounds in petroleum. The work will be carried on by Dr. Parry Borgstrom.

The British Thomson-Houston Company has presented two electric motors to the Coal Treatment Laboratory in the University of Birmingham.

Mr. A. Oldroyd, managing director of the Dewsbury branch of the Yorkshire Dyeware & Chemical Manufacturing Co., Ltd., has died, aged 73.

We regret to learn of the death, at the age of 74, of Dr. E. H. Rennie, for over forty years Professor of Chemistry in the University of Adelaide. He contributed papers on the chemistry of various natural products to the JOURNAL of the Chemical Society.

The late Mr. F. N. Layman, manufacturing chemist, left £63,062, with net personalty £62,542.

The death is announced of Mr. F. Whowell, general manager of the Bleachers' Association, Ltd.

Dr. F. J. Moore, former professor of organic chemistry in the Massachusetts Institute of Technology, has died, aged 59 years.

Technical Data

M. Ch. Marie, General Secretary of the International Committee responsible for the publication of the "Annual Tables of Constants and Numerical Data," announces the publication of a volume entitled "Numerical Data for Engineering—Metallurgy," extracted from Vol. V of the "Annual Tables." The volume, which is by M. L. Descroix, and contains a preface by Sir Robert Hadfield, Bart., F.R.S., includes all the data relating to engineering and metallurgy for the years 1917–1922 inclusive. The price of the volume is, paper backed, 105 francs, bound 126 francs, but to members of the Society of Chemical Industry the price is reduced to 78.75 francs and 94.50 francs, respectively.

A similar volume, also extracted from Vol. V of the "Annual Tables," and entitled "Numerical Data for Electricity, Magnetism, Electrochemistry," by M. G. Malapert, Dr. A. Buffat, Dr. G. I. Higson, and Dr. K. Gordon, has also been published. The price, paper backed 56 francs, bound 77 francs, is reduced, for members of the Society of Chemical Industry, to 42 francs and 57.75 francs, respectively.

Research Association of British Paint, Colour and Varnish Manufacturers

Arrangements have been made to purchase a property at Teddington, near to the National Physical Laboratories, to be used as the research station and laboratories. It is hoped that the premises will be ready for occupation by the end of March. A Technical Advisory Committee was appointed at a meeting of the Council held on January 4 to consider and draw up the preliminary programme of research. A second member of the technical staff has been appointed, viz., Dr. J. O. Cutter, Ph.D.

Recent Publications of the Department of Scientific and Industrial Research

Building Research Technical Paper, No. 4 (H.M. Stationery Office, price 6d.), discusses methods for determining the free lime in hydraulic cement. The resistance of cement to sea water, fire and other agencies depends largely upon its content of free lime, and the description of reliable methods of estimation will be welcome to those who have to deal with hydraulic cement.

Success in the kiln seasoning of wood depends upon a knowledge of the movement of moisture in the wood, a subject which is dealt with in the second Technical Paper of the Forest Products Research Laboratory. The experimental results obtained illustrate the factors which require consideration in the application of artificial seasoning.

Institute of Metals

At the annual general meeting of the Institute of Metals, to be held in London on March 9 and 10, 17 papers are expected to be submitted. In the evening of March 9 the annual dinner of the Institute will take place at the Trocadero Restaurant. Following the dinner—at which there will be a curtailed toast list—a dance will be held. This dinner dance is the first function of the kind to be arranged by the Institute.

The annual autumn meeting of the Institute of Metals will be held at Derby in September. Arrangements for

the meeting are being made under the direction of Sir Henry Fowler, K.B.E., LL.D., of Derby. Sir Henry, who is Chief Mechanical Engineer of the London Midland & Scottish Railway Company, has just been appointed a Vice-President of the Institute.

The past year witnessed a steady growth in the membership of the Institute of Metals in spite of Great Britain's industrial troubles. The membership on December 31, 1926, was 1,801, as compared with 1,692 a year previously. If this rate of increase is but slightly raised during 1927 the membership should reach the 2,000 mark before the Institute celebrates its twentieth anniversary next year. The next election to membership is due to take place on January 19, followed by another on February 23. Particulars of the Institute, incorporated in a newly-issued booklet, can be obtained by intending applicants for membership from the Secretary, Mr. G. Shaw Scott, M.Sc., 36, Victoria Street, London, S.W.1.

Beet Sugar Industry

The Anglo-Scottish Beet Sugar Corporation factory at Poppleton, York, one of six factories now under the control of the corporation, was officially opened on January 7 by Lady Invernairn. The factory is said to be capable of dealing with 10,000 tons of beet daily.

A contract for the erection of a beet sugar factory at King's Lynn, to deal with 1200 tons of beet per day of 24 hours, has been placed with Fawcett, Preston & Co., Ltd., sugar machinery manufacturing engineers, of Liverpool. This factory, which will be ready for the 1927 beet crop, will be operated by a company to be formed by the Anglo-Dutch Group. It will be the 15th beet sugar factory in Great Britain.

Research in Pure Chemistry at Mellon Institute

According to Dr. Edward R. Weidlein, director, Mellon Institute of Industrial Research, University of Pittsburgh, there has been established in the Institute a definite department of research in pure chemistry, with Dr. Leonard H. Cretcher as the head. As a senior fellow of the Institute, Dr. Cretcher (A.B., Michigan, 1912; Ph.D., Yale, 1916) has been in charge of the institution's fundamental chemical studies since 1922, and has published jointly with several assistants and other members of the Institute a number of papers on the results of their organo-chemical researches.

As head of the new department, Dr. Cretcher will have supervision over all the Institute's investigations in pure chemistry, and will also serve as an adviser to industrial fellows who are carrying on research on problems in synthetic organic chemistry. Dr. Weidlein says in his announcement of the departmental plans that Dr. Cretcher's activities will be operated as an integral part of the Institute, and will be sustained by institutional subsidy. Dr. William L. Nelson (B.S., Trinity, 1920; Ph.D., Pittsburgh, 1926), who has been named as the first fellow in the department, was a member of the staff of the department of chemistry of the University of Pittsburgh during the period 1922–6.

Dr. Weidlein states that while Mellon Institute is primarily an industrial experiment station, it has always recognised the need of fundamental scientific

research as a background and source of stimulus for investigation on behalf of industry. During the past five years the Institute has been giving a constantly increasing amount of attention to the encouragement and support of research in pure chemistry, and has been progressively successful in arranging for funds to devote to the prosecution of investigations not suggested by industry, but planned within the Institute, and aimed towards the study of more basic problems than those usually investigated for direct industrial purposes. In the Institute's new department of research in pure chemistry this interest and work will be nurtured and given opportunity to expand.

American Electrochemical Society

The Spring Meeting of 1927, which marks the twenty-fifth anniversary of the Society's organization, will be held at the Benjamin Franklin Hotel, Philadelphia, on April 28, 29 and 30. Elaborate preparations are in hand to make this anniversary meeting an exceptional one. A symposium, presided over by Dr. H. S. Taylor, will be held on "The electrochemistry of concentrated solutions," and great interest is also being shown in the symposium on "The gaseous reduction of ores," papers having been promised on the reduction of iron, nickel, tungsten, molybdenum, zinc and tin ores.

An unusual opportunity to visit reduction and refining plants will be afforded by the "North-western Trip" of the Society in the coming autumn, when a visit will be arranged to numerous metallurgical plants in the Pacific North-west.

Research in Cotton

Speaking recently at the Manchester Athenaeum, Dr. J. C. Withers, describing some of the recent work at the Shirley Institute, said the Institute now possessed a method of ascertaining the source of raw cotton of varying origin. They had gained valuable experience in testing mechanical and other damage to raw cotton, and had developed a new standard yarn tester. A successful examination had been made of the thermal properties of a fabric, and in consequence the development of new methods of manufacture was foreshadowed.

United States Chemical Industry in Conference

Plans are being made in the United States for a conference of leaders of the chemical industry under the auspices of the Chemical Trades Advisory Committee of the U.S. Department of Commerce.

Alkali Cyanide in Furnace Gases

Following its investigations of alkali-cyanide concentration in blast-furnace gases, the U.S. Bureau of Mines has concluded that it seems unlikely that the operation of the blast furnace would be adversely affected by the withdrawal of a small part of the gas for the recovery of cyanides. If one-tenth of gas at a certain plane in the furnace studied by the U.S. Bureau of Mines were withdrawn, it is estimated that the daily recovery of crude cyanide would be 1,040 lb., which, at 10 cents a pound, would be worth \$104.

The Sesamum Crop of British India

From information received from reports of states which comprise, on an average, 79.5% of the total area under sesamum in India, the total acreage estimated at present is 3,157,000, as against 3,193,000 acres at the same time

last year. Present condition of the crop is, on the whole, fair.

Indigo Crop of British India

From information received from provinces which contain about 85% of the total area under indigo in India, the total acreage is estimated at 100,400, or 25% below the area of last year. The total yield of dye is estimated at 20,100 cwt., as against 28,200 cwt. last year, or a decrease of 29%.

Nickel in Canada

The nickel content of nickel compounds sold from Canadian plants during the first half of 1926 totalled 34,519,896 lbs., valued at \$7,702,754, as compared with a total of 34,810,990 lbs., worth \$7,792,145 reported during the first half of 1925. Nickel is exported from Canada as refined metal or as the oxide, and some is shipped as nickel-copper matte for refining elsewhere.

Restricted Imports of Chemical Plant into Russia

It is reported that the Soviet Industrial Planning Authority has decided to reduce the programme of imports of chemical plant by 30%. The chemical trusts view the decision with concern, however, as they believe that the result will be to hamper certain sections, particularly the rubber and match industries, very greatly.

European Glue Syndicate

It is reported from Geneva that the European producers of glue have formed a syndicate, with the object of reducing competition. It is not known how far the syndicate will be representative as it appears that some large manufacturers, particularly in Holland, are not included in it.

Nitrogen Fixation in Germany

The Klockner concern has made an agreement with the Kuli Industrie A.-G. relating to supplies of fixed nitrogen for the manufacture of a new compound fertiliser. The Claude process will be used, if satisfactory arrangements can be made with the patentees, and either the existing factory will be enlarged or a new one will be built.

The Action of Organic Compounds on Alcoholic Fermentation

In a recent paper (*G. Chim. Ind.*, Nov., 1926), Prof. Mameli, of Parma, describes the results of a long series of investigations into the action of organic compounds on alcoholic fermentation. Many groups were examined, and it was found that phenoxyacetic acids and their sodium salts, cumarones, and diketobenzoisoxazines, greatly stimulated alcoholic fermentation when added in very small concentrations, but when used in higher concentrations, depressed the rate. As phenoxyacetic acids and cumarones not only stimulate enzymic activity, but are able to raise the body temperature without causing symptoms of local intolerance, properties which are both associated with biocatalytic agents such as hormones and vitamins, further work is to be carried out to ascertain whether these compounds can act as vitamins.

The Copper Combine

It is understood that at the conference at Brussels of European members of the International Copper Combine, the British Metal Corporation, one of the most important copper firms, announced its intention to leave the combine, owing principally to the price policy of the combine.

REVIEWS

THE ESSENTIAL OILS. By HORACE FINNEMORE, B.Sc.
Pp. xv+880. London: Ernest Benn, Ltd., 1926.
Price: 70s. net.

Treatises on essential oils are often subdivided into three sections, the first being descriptive of individual oils, while the others deal respectively with the chemistry of the component substances and the general analytical methods used in this branch of organic chemistry. Mr. Finnemore has combined these three aspects of the subject, his arrangement of the material being based upon the botanical system of Engler and Gilg. The chemistry of the individual substances, together with the methods used in their diagnosis and isolation, are consequently discussed in a sequence which may appear somewhat unusual to the chemical reader. This method of treatment, however, allows of a welcome curtailment of the enormous mass of data which must necessarily be handled in a work of this kind. In the opinion of the reviewer, the author has rightly refrained, in a work of one volume, from entering into the detailed chemistry of individual substances, the references to original papers being sufficient in most cases to permit of the ready acquisition of further information. The analytical details are also given in a clear, concise and satisfactory manner. The test given on p. 573, however, is not necessarily indicative of the presence of *l*- (or *d*-) α -phellandrene in eucalyptus or other oils, unless the pure α -nitrosite—having m.p. 121–122°, and $[\alpha]_D \pm 140^\circ$ to $\pm 150^\circ$ in chloroform after five minutes—can be isolated by fractional crystallisation from the crude product of the reaction.

In all, the work contains accounts of about 2000 essential oils. The descriptions of the more important oils contain details of cultivation, subsequent treatment, physical and chemical characteristics, analysis and uses; statistics are also freely quoted in illustrating their economic value. Analyses of material from various localities are often given, and the author discusses more fully than usual the interesting question of the geographical distribution of various important genera and species. Especially to be commended is the stress laid upon the urgent desirability of developing the production of valuable essential oils in the British Empire, with its almost unlimited diversities of climate and other conditions. An indication of such latent possibilities is afforded, for example, by successful attempts to cultivate in Northern Rhodesia three species of *Eucalyptus* which afford prolific yields of geraniol, citral and cineole, respectively. Mr. Finnemore's summary may be supplemented by adding the striking fact that certain species of this remarkable genus are capable of flourishing in the open as far north as Scotland. The economic possibilities in this one genus, comprising some 300 species, each with its characteristic leaf-oil, are enormous: nevertheless, these possibilities have received little more public recognition in Australia than in Great Britain. That the backward condition of the British essential oil industries is not due to lack of initiative and vigour among British men of science is evidenced by the important advances in this field of enquiry which have accrued during recent years from investigations carried

out not only in Great Britain, but notably also in Australia and in India. It is a pleasing feature of the book under notice that Mr. Finnemore has drawn particular attention to these "steady and valuable researches," which in some instances are of equal interest and importance to pure and applied organic chemistry: a case in point is provided by the recognition, in India, of *d*-piperitone in a Himalayan grass oil (p. 145) almost immediately after the characterisation, in Australia, of *l*-piperitone from a series of *Eucalyptus* oils (p. 570). It is an additional satisfaction to find in Mr. Finnemore's treatise an able summary of the important but inadequately recognised work of H. G. Smith and R. T. Baker on the essential oils of the eucalypts and Australian pines.

The plan of this book demands a thoroughly comprehensive index, and in this respect there is undoubtedly room for improvement. Although satisfactory for the direct indication of individual oils, the present index often affords little guidance to the occurrence of particular substances; indeed, in some instances one reference only is given to a component which is mentioned repeatedly in the text. As a further example, the five references to piperitone ignore the important occurrence of *d*-piperitone in the oil of *Andropogon Jwarancusa*. The references to analytical methods are likewise scanty; such entries as "Acetylation," "Saponification," "Aldehydes, determination of," etc. are absent, although the text contains descriptions of standard methods which should be indexed under these headings. An author index would be an additional aid to chemical investigators in this field.

Taken in its entirety, Mr. Finnemore's book provides a noteworthy and valuable contribution to the literature of essential oils. It may be recommended with confidence to chemists, botanists, manufacturers, oil distillers and others who require a handy and up-to-date account of this increasingly important subject. The book is printed in a large and clear type, and its appearance reflects credit on the printers and publishers. It may be suggested, however, that the decidedly high price of the volume might have been reduced appreciably by adopting a less expensive format, in particular by omitting the plates, which, although interesting, are not indispensable.

JOHN READ

CHEMISTRY OF THE OIL INDUSTRIES. By J. E. SOUTHCOMBE, M.Sc., Second edition, revised and enlarged
Pp. xiv + 224. London: Constable & Co., Ltd., 1926. Price: 12s. 6d. net.

The object of this work, as indicated by the author in the Preface, is to form a bridge between the elementary text-books of pure chemistry and the numerous technical treatises and monographs of a specialised character. The author has, on the whole, been successful in his aim, for after a useful introductory chapter dealing with the relevant organic chemistry, he passes on, following a chapter dealing with the theory of the colloidal state, to give in broad outline a general account of the mineral oil industry, the sources and modes of preparation of the fatty oils, their composition and properties and the various industrial operations in which they are largely concerned.

Considering, however, that the book is now in its second and revised edition, it is to be regretted that the author has not kept more abreast of the times with some of the subject matter. As an instance, no reference is made to the now well-established hypochlorite method of refining petroleum, the author contenting himself with a description of the older and costlier sulphuric acid and soda method. The statement (p. 216) that "progress in refining during the last decade has been primarily on the engineering side" is one not likely to pass unchallenged by those connected with the chemical side of the petroleum industry.

The account of the production of edible oils (p. 172) is very loosely worded, and badly arranged: one would not recommend the use of alkaline earths and carbonates for removing free fatty acids, nor would one propose to remove volatile matter by boiling the oils with water. The account of the recovery and distillation of glycerin is too meagre, whilst to the now important operation of hydrogenating fatty oils the author devotes only four lines of print (p. 217).

A number of minor errors have crept into the text: cerotic acid should be written $C_{25}H_{51}COOH$ its parent hydrocarbon being hexacosane, $C_{26}H_{54}$, and not pentacosane (p. 25), "trydecyl" should be written tridecyl (p. 25), "pseudo-umene" should be pseudo-cumene (p. 50); one notices also "phytostearol" for phytosterol, "*Cocos*" *nucifera* for *Cocos nucifera*, *Brassica* "*Napus*" for *Brassica Napus* (p. 77), and "Hexo-bromide" instead of Hexabromide (p. 130). H. M. LANGTON

AMBRONN-FESTSCHRIFT KOLLOIDCHEMISCHEN BEIHEFTE. Edited by A. FREY AND W. OSTWALD. Pp. 376. Dresden: Theodor Steinkopff, 1926. Price: 18 m.

The "Festschrift" is a pious and useful institution. Contributors obey the opening injunction of the 14th chapter of Ecclesiastics and enjoy the advantage, which is shared by the reader, of seeing papers dealing with one particular line of research collected in a stately volume. The one under review is largely devoted to the investigation of the structure of disperse systems by polarised light and by X-rays. Summaries of Ambronn's fundamental investigations in this field are given by A. Frey and by C. Steinbrink. A number of papers by E. A. Hauser and H. Mark (stretched india rubber), E. Ott (crystallised albumin), J. R. Katz (synthetic rubber), and Katz and O. Gerngross (tendons) describe X-ray investigations of the structure of colloidal and organised material. K. Hess gives very fine illustrations of the astonishing crystals—fully developed and sometimes macroscopic—of cellulose acetate, which he obtains by slow concentration of solutions in tetrachlorethane. The complex mercury derivatives of sulphosalicylic acid, investigated by Wo. Ostwald and M. Mertens, exhibit a number of remarkable properties, the most striking of which is accidental double refraction, enormous in amount and all the more conspicuous, as the sols of these substances are quite colourless. On the addition of certain dyes they become dichroic (S. Berkman and H. Zocher).

Space forbids the mention of more than one among the remaining contributions, that of H. Siedentopf on anastigmatic condensers for dark ground illumination, which will appeal to students of the beautiful and austere subject of geometrical optics.

The whole volume, as did the Zsigmondy-Festschrift, again gives evidence of great activity, which seems to be in no way hampered by the increasing complexity and costliness of the apparatus required for modern methods of research. E. HATSCHKE

GUM ARABIC, WITH SPECIAL REFERENCE TO ITS PRODUCTION IN THE SUDAN. By H. S. BLUNT, M.A. Pp. 15. London: Oxford University Press and Humphrey Milford, 1926. Price: 10s. 6d. net.

This handsomely produced volume contains only some 40 pages of text divided into thirteen chapters, as follows: Gum, general description; History of the trade; The tree (botanical etc.); Kordofan Province, Exploitation; Markets; Freights and freightage; Royalty; Chemical properties and uses; Water supply of Kordofan Province; Um Ruaba experimental Government plantation; Origin of Gum; Forest Policy. It will be seen that the arrangement of chapters does not follow a very logical sequence. The book concludes with a bibliography, a glossary, a rainfall map of Kordofan Province, and a series of plates of nearly fifty picturesque photographs, some of which are relevant to the subject.

The first chapter consists of half a page, from which it can be inferred that the general description of gum is noteworthy chiefly for its brevity. The only other chapter calling for comment is that entitled chemical properties and uses. This amounts to just over three pages, a rather high proportion being taken up by useless and irrelevant information of a non-scientific and non-technical character, whilst the actual chemical and physical portion is so elementary as to be almost useless. Although a fairly long list of corrigenda is printed, it is not complete, as is shown by "galacose" for "galactose" on page 29. PERCY MAY

ZERKLEINERUNGS-VORRICHTUNGEN UND MAHLANLAGEN. By CARL NASKE. Pp. x + 375. CHEMISCHE TECHNOLOGIE IN EINZELDARSTELLUNGEN, edited by Prof. A. BINZ. Fourth enlarged edition. Leipzig: Otto Spamer, 1926. Price: bound, 36 r.m.; paper, 33 r.m.

The first two hundred pages of this work is devoted to machines employed in size reduction, beginning with coarse crushing machinery of the jaw and gyratory types, passing to fine grinding by descriptions of crushing rolls, impact, hammer and edge runner mills, as well as stamp, ring roller, ball and tube mills, and concluding with a section on wet grinding.

As most of the machines described are of continental manufacture, the book shows the developments in this class of machinery in Europe, and especially in Germany. One failed to notice in this section any mention of the disc crusher either of the vertical or horizontal type, and one might also suggest that as colloids and colloidal solutions are playing an increasingly important part

in many industries, the author may with advantage enlarge the scanty reference to this subject in subsequent editions.

The grouping of particles of the same size forms the subject matter of the next chapter, in which machines are described for effecting this either by the passage of the material over screens or by air separation. Here again the author might consider the expansion of this chapter to include some of the other means of grading. The final portion of the book deals with the transport of materials in bulk to the factory, the different machines employed to move them inside the works, the various methods of removing dust, and concludes with a large section describing layouts of crushing, grinding, sifting and transport units in cement, gas and other works.

The book is well printed and illustrated, but the paper edition, for a book of this value and price, is not sufficiently well bound to enable it to withstand reasonable usage. Cutting of the pages, too, imposes an unnecessary task.

THE CALENDER EFFECT AND THE SHRINKING EFFECT OF UNVULCANISED RUBBER. Dr. W. DE VISSER. Translated from the original Dutch by E. S. ALLSOP. Pp. viii + 152. London: Crosby, Lockwood & Son, 1926. Price: 15s. net.

The anisotropic character frequently exhibited by sheeted rubber has long been a source of trouble to the rubber manufacturer; more recently, however, it has also attracted attention on account of its bearing on the mechanical structure of rubber. The author gives an account of a comprehensive investigation of the subject made mainly in the Rubber Institute laboratory at Delft; a section, however, more physical in character was completed at University College, London. Phenomena associated with this anisotropism include a difference of mechanical properties in different directions, a tendency to recovery, double refraction, exalted specific gravity and rapid hardening. Methods found to be essential to trustworthy results and the influence of various factors are recorded. The nature of this physical condition, which is shown not to be peculiar to natural rubber, but to be shared by other elastic gels such as synthetic rubber and casein, is discussed and referred to a probable partial oriented "crystallisation" of the material.

The volume is attractive in form and type. Misprints are few, and "Casilloa" (p. 128), *Crasiliensis* (p. 147), and a reference to the "rubber particles in gutta percha latex" are not likely to mislead. Unfortunately, reading is frequently rendered difficult by quaint English, a selection of the unusual expressions being "reproductive" and "reproductiveness" for "reproducible" and "reproducibility" (p. 11), "invaluable" for "valueless" (p. 36), "notch" for "projection" (pp. 78 and 90), "oversight" for "record" (p. 142), and "arduous dissolubility" (p. 126). The book, however, is a decided scientific contribution to the literature of a subject which forms the meeting-place for some of the latest structural theories of rubber with the unwritten lore of the practical "rubber man."

D. F. TWISS

REPORT

Report of the Fuel Research Board for the Year 1925, with Report of the Director of Fuel Research. Department of Scientific and Industrial Research. Pp. 79. H.M. Stationery Office, 1927. Price 1s. 3d.

In the report of the Fuel Research Board steady progress is recorded in the work of the Physical and Chemical Survey of the National Coal Resources, under which three new committees have been added to the list. It is pointed out that the importance of methods of sampling and analysis of coal is being increasingly realised. A final report on methods of analysis, embodying those recommended in 1923, with minor amendments, is being prepared, and progress is being made by the sub-committee dealing with the difficult question of sampling. Investigations have been continued into the use of vertical retorts and into the enrichment of the gas by injecting oil during carbonisation. It has been found possible to double the normal rate of throughput, using certain coals. The work on low-temperature carbonisation was continued, employing continuous vertical metal retorts, with the object of obtaining good domestic coke and a maximum of oil-producing tar. A hopeful view is taken of the retort elaborated, but steady work for a long period is required to enable its commercial value to be judged. A description of these retorts is given in both sections of the report.

An increase in the staff has made it possible to carry out further systematic work on the effect of variations in the carbonisation temperature on the gas, tar and coke produced, and laboratory work is being carried out on the nature of the gas and tar, on the reactivity of coke, and on other problems. The constituents of the tar and its possible use as a source of various chemicals are being investigated at the Chemical Research Laboratory at Teddington.

The work on the bacteriological production of power alcohol from cellulosic materials was continued at the Royal Cordite Factory and, as a by-product of this investigation, a binder for briquettes has been prepared from straw and other vegetable materials. It is considered that the method may produce a cheap and effective binder, and if successful may have a very important bearing on the problem of low-temperature carbonisation and the manufacture of "artificial" fuel from coal-dust.

The Director of Fuel Research deals, in his Report, with the Physical and Chemical Survey of the National Coal Resources, with the work done in connexion with the gas industry, low-temperature carbonisation, coal purification, steam-raising, power alcohol, domestic heating, and laboratory and small-scale work. The work on the enrichment of coal gas and on increasing the throughput of vertical retorts is described more fully here. The experimental setting of horizontal retorts was erected during the year and provided with all necessary accessories. Under the heading of low-temperature carbonisation an account is given of the investigations with cast-iron vertical retorts with external heating, and much interesting information is given about the different types of retorts utilised. As difficulties arise, owing to the deterioration of the retorts, the

question of the most suitable metal to withstand higher temperatures is being investigated with the co-operation of the British Cast-Iron Research Association and Prof. H. C. H. Carpenter. It is concluded that, given a suitable metal for the retorts, there is no difficulty in producing a lump coke for domestic use from a suitable blend of coal when charged in reasonably small sizes. Should it be possible to prepare binding material from straw and other vegetable matter, it would be possible to use other types of retorts which produce good tar yields but coke of small sizes, which could then be briquetted into lumps suitable for all purposes. Reference is made to the important tests of low-temperature carbonisation plants which the Government has authorised the Department to carry out. Valuable work is in progress on "low-temperature" tars, mainly from the point of view of the conversion, in the cheapest and best way, of the tar into motor spirit, fuel oil and, if possible, all the other products yielded in quantity by mineral oils. The elucidation of the constituents of the tar with a view to the identification of ingredients of value other than as fuel comes within the province of the Chemical Research Laboratory at Teddington, but no hard and fast division of work is made. Work is being carried out on the distillation of tar and the miscibility of crude low-temperature tar with petroleum fuel oil, including tests of the Lessing process for the removal of the pitch in the tars. Arrangements for installing the experimental coal-washing plant are in hand. Interesting work has been conducted on steam-raising and on the use of motor spirit obtained from coal in a special internal-combustion engine.

In the work on the production of alcohol from cellulose materials, attention is being concentrated on the direct fermentation of hemicelluloses and pentosans, and further progress has been made.

Experiments on problems of domestic heating are now carried out at the new Building Research Station near Watford.

A special section deals shortly with the large amount of laboratory and other analytical work carried out at the Fuel Research Station. Useful results have been obtained on the hydrogenation of coal, using a small pressure bomb. A small continuous plant for the hydrogenation of coal is to be installed, and arrangements have been made by which the British Bergius Syndicate keeps the Department informed of all the experimental work on the Bergius process which is being carried out on British coals. Investigations are being continued on the analysis of coal and coal gas, on the temperature of the initial decomposition of coal, the reactivity of coke, the carbonisation of coal in the form of fine particles (as in the McEwen-Runge process), adsorptive agents for the recovery of benzene, calorimetry, CO and CO₂ recorders, and the X ray analysis of coal.

Amongst the miscellaneous work described is an important investigation, which is being continued, on the spontaneous combustion of coal on ships.

Appendix III contains a summary of progress made by the Physical and Chemical Survey of the National Coal Resources, covering a very large amount of important work, and Appendix IV reproduces a valuable memorandum prepared by Dr. Lander in his capacity as Assessor to the Royal Commission on the Coal Industry (1925).

COMPANY NEWS

CASTNER KELLNER ALKALI CO., LTD.

A net profit of £210,928 is reported for the year to September 30, 1926, making available, with £28,008 brought forward, £238,936, compared with a profit of £296,557 for the previous year. A final dividend has been declared of 14%, making 22% (same), leaving £18,936 to be carried forward.

BRITISH CYANIDES CO., LTD.

The annual general meeting was held on January 4, Mr. C. F. Rowsell, chairman, presiding. In the past, satisfactory results had been obtained by the conversion of sulphocyanide, obtained from the gasworks, by the company's process into ferrocyanide and similar chemicals, but since the war there had been a heavy drop in the price of the chemicals produced, resulting not only in a considerable loss to the company, but rendering its business as a whole unprofitable. The research department had been working continuously to find new uses for the raw material which the company was bound under contract to take from the gasworks, and discovered that a chemical known as thiocarbamide could be produced. About this time the Board had to decide whether to close down the business or continue to manufacture at a loss, and it was decided that as sulphocyanide would be required in large quantities for the new chemical and its development, it would be in the interests of the company to adopt the latter course. Accordingly a scheme was submitted, and subsequently approved, for providing new capital by reducing the £1 shares to 2s. It was then proposed to increase the capital to its original amount of £450,000 by the creation of 3,312,746 new ordinary shares of 2s. each, each shareholder being entitled to subscribe for two new ordinary shares of 2s. each. The position of the preference shareholders was that they were asked to sacrifice the cumulative dividend, which had not been paid up to the present time, and that their dividend should not again become cumulative until after the end of 1928. They would also be given the option of converting their shares into ordinary shares at the rate of five ordinary shares for one preference share for three years. Mr. Kenneth M. Chance, the managing director, said that the most important factor in the situation of the company was that for the development of their new industries they must control a cheap supply of thiocarbamide, for which cheap sulphocyanide was required. Therefore the contracts with the gasworks must be maintained, and the surplus disposed of. This could only be done by making it into prussiate of soda and selling it as such. The manufacture of moulding powders by the Beetle Products Co. had already reached the commercial stage, the demand, especially before Christmas, being heavy. As regards the cotton side of the industry, the fact that such firms as the Bradford Dyers' Association and Bleachers' Association were co-operating with the company in developing that particular business on a commercial scale should be sufficient evidence that there was a great future for that side of the industry.

ALLEN LIVERSIDGE AND CO., LTD.

An interim dividend has been declared on the ordinary shares at the rate of 10% per annum (5% actual), less tax, being the same as last year's interim.

COMMERCIAL GAS CO., LTD.

A Parliamentary Bill has been deposited by this company for next session, which proposes to reduce the basic price of gas from 1s. per therm to 11.4d. per therm, at which price the standard rate of dividend is proposed to be fixed at 5 per cent. on the ordinary stock issued, all of which is to rank equally for dividend, and at the rate of 6 per cent. on any ordinary stock issued after the passing of this Act. The surplus profits, after payment of these dividends, are to be divided as to three-fourths to the consumers and one-fourth to the ordinary stockholders and employees in two equal shares.

MIDLAND BANK, LTD.

The net profit for the year to December 31, 1926, was £2,535,730, which, with £813,166 brought forward, makes £3,348,896 for appropriation as follows:—To interim dividend for the half-year to June 30 last, paid July 15, and dividend for the half-year to December 31 last, payable on February 1 next, each at the rate of 18% per annum less income tax, £1,823,874; to bank premises redemption fund, £500,000 (£600,000 for 1925); to officers' pension fund, £200,000 (£150,000); leaving £825,022 to be carried forward (£813,166).

LYDENBURG PLATINUM AREAS, LTD.

The first ordinary general meeting was held on December 30 last, Mr. J. A. Agnew (chairman) presiding. After describing the work done at the various properties, the chairman stated that during October 1463 tons of ore were treated at the plant at Maandagshoek, and that up to date 4800 tons had been milled in this plant for an estimated total recovery of 1260 oz. of platinum and associated metals, of which 970 oz. were recovered in the form of metallies and 290 oz. in concentrates, the metals recovered being valued at about £24,224. It has now been decided to double the capacity of this plant, which will then be capable of dealing with a minimum of 100 tons of ore per day; taking platinum at £20 per ounce, and making ample allowance for the treatment of concentrates etc., the estimated profit should be between £10,000 and £12,000 monthly. On the completion of the pilot plant erected on the Dwarsriver property, it was decided to neglect for the time being the treatment of the oxidised ore on the norite reef, which presented many difficulties, and to combine gravity and flotation concentration methods in this plant for the treatment of sulphide ore which lay below the oxides. The plant commenced operating at the end of May and continued until October, 5,180 tons of ore being crushed and treated, the average value being 1.631 dwts. platinoids per ton from which 0.87 dwts., or 53.3%, was recovered. In conclusion, the chairman stated that the balance of £45,000 in hand shown in the balance sheet had been absorbed in further development work, including additions to the Maandagshoek plant. There was a small overdraft from the bankers, and when this had been extinguished by the returns now coming forward from Maandagshoek, and when the Maandagshoek plant is running on the enlarged scale, it was proposed to take up again the development of certain of the ore deposits other than the dunites. He looked forward to concrete and satisfactory results during the current year.

BRITISH METAL CORPORATION, LTD.

At an extraordinary general meeting held on December 23, the resolutions rearranging the capital passed at the extraordinary general meeting on December 8 were confirmed as special resolutions (cf. CHEM. AND IND., December 10 and 17, 1926, pp. 937 and 963).

BRITISH SUGAR MANUFACTURERS, LTD.

The adjourned first ordinary general meeting of this company, formed in 1925 to construct and operate a beet sugar factory in Norfolk, was held on December 31, 1926, Mr. H. E. Carter presiding. A loss of £24,187 was reported for the period ended March 31, 1926, and with the addition of loan and debenture interest, £3,584, and a depreciation allowance of £11,269, the deficit was raised to £39,400. In common with all other countries, the tonnage of beet per acre in this country, especially in the fenland, had been much lower than anticipated. Up to the present the company had put through an untared weight of about 50,000 tons of beetroot, and had produced about 4,700 tons of white granulated sugar and about 2,000 tons of molasses, and they would probably receive sufficient beet to bring them to 55,000 tons untared, thus being about 15,000 tons short of their earlier estimates. The directors anticipated an improvement during the current year, an increased number of applications having already been received from growers.

TURNER AND NEWALL, LTD.

The accounts for the year to September 30, 1926, of this company of asbestos manufacturers show a net profit, after providing for depreciation and taxation, of £287,080, plus £19,127 brought in, compared with £287,936 for 1925. A final dividend of 1s. 6d. per share has been declared, making 2s. per share, less tax (same), and £15,162 has been carried forward.

LIVERPOOL NITRATE CO., LTD.

The accounts for the year ended June 30, 1926, show a profit of £14,598, which with £26,943 brought forward, makes £41,541. After deducting £21,000 for the interim dividend of 1s. 6d. paid last May, a balance remains of £20,541, which it is proposed to carry forward.

BRITISH BURMAH PETROLEUM CO., LTD.

The sixteenth ordinary general meeting was held on December 17, the Hon. L. Holland, chairman, presiding. The total gross production of this and their allied Rangoon Oil Company during the year ended July, 1926, was 646,407 barrels, being 61,175 barrels less than for the previous year. The total working profit for the year was £349,520, compared with £312,270, to which has been added a refund of £5,349 in respect of Dominion income-tax and £6,449 brought forward from 1925. After meeting all charges, the net profit was £83,230, against £53,149. A dividend of 7½d. a share, free of income-tax, was declared. The chairman emphasised the need of keeping sufficient funds available for securing further sources of crude oil supplies, in view of the ever-diminishing supply.

REEVES AND SONS, LTD.

An interim dividend of 2½%, less tax, has been declared on the ordinary shares, payable on January 20.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
 Bisulphite of Lime—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
 Borax, Commercial—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3¾d. per lb. ex wharf. Lond. in cwt. kegs.
 Sal ammoniac.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3¾d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included. Sod. Chlorate.—2¾d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
 Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
 Arsenic, Sulphide, Yellow.—2s. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 2d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 per ton. Scarce. Grey, £17 5s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£8 5s.—£10 per ton and upwards, according to grade and locality. Very scarce and fair demand.
 Iron Liquor.—1s. 6d. per gal. 32° Tw.; 1s. 2d. per gal. 24° Tw.
 Red Liquor.—10d.—11d. 16° Tw. per gal.
 Wood Creosote.—2s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 10d.—4s. per gal., 60% O.P. Solvent, 4s. per gal., 40% O.P. Both scarce and in fair demand.
 Wood Tar.—£4—£5 per ton and upwards, according to grade.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carbolic.—Crystals, 6½d.—7d. per lb. Crude 60's, 1s. 8d.—1s. 10½d. per gal.
 Acid Cresylic, 99/100.—2s. 2d.—2s. 3d. per gal. Steady. 97/99.—2s.—2s. 6d. per gal. Pale, 95%, 1s. 10d.—2s. 4d. per gal. Dark, 1s. 9d.—2s. 3d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 3½d.—1s. 4½d. per gal., ex works in tank wagons; Standard motor, 1s. 11½d.—2s. 2½d. per gal., ex works in tank wagons; Pure, 2s. 2½d.—2s. 5½d. per gal., ex works in tank wagons.
 Toluene.—90%, 2s. to 2s. 6d. per gal. Firm. Pure, 2s. 3d.—2s. 8d. per gal.
 Xylol.—2s. 3d.—2s. 8d. per gal. Pure, 4s. per gal.
 Creosote.—Cresylic 20/24%.—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9½d. per gal.
 Naphtha.—Crude, 10d.—1s. 1d. per gal., according to quality. Solvent 90/160, 2s.—2s. 1d. per gal. Solvent 95/160, about 1s. 11d. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton, Whizzed or hot pressed, £9 per ton.
 Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—112s. 6d.—130s. per ton, f.o.b. according to district. Scarce and more enquiry. Prices nominal.
 Pyridine.—90/140.—9s. 6d.—17s. per gal. Nominal. 90/180.—7s. 6d. per gal. Heavy.—7s.—10s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.*
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—9½d. per lb., naked at works.
 Aniline Salts.—9½d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d.—4½d. per lb. Quiet.
 m-Cresol 98/100%.—2s. 8½d. per lb. Quiet.
 p-Cresol 32/34° C.—2s. 8½d. per lb. Quiet.
 •Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—7d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 4d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—9d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xylidine Acetate.—2s. 11d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4d.—2s. 6d. per lb. Firm.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity.
 Acid, Boric B.P.—Cryst. £40 per ton. Powder £44 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 3½d.—1s. 4½d. per lb. Less 5%. Weak market.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4½d.—1s. 6d. per lb. Firm and good enquiry. Technical 11½d.—1s. per lb. Good enquiry.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 0½d. per lb. Less 5%.
 Amidol.—9s. 6d. per lb. d/d.
 Acetanilide.—1s. 7d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—11s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £30 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Aspirin.—2s. 4d. per lb. Good demand.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzophenanthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.

Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carriage paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 3d.—2s. 4d. per lb. Potassium.—1s. 9d.—1s. 11d. per lb. Sodium.—2s.—2s. 2d. per lb. All spot.
 Calcium Lactate.—1s. 4d.—1s. 6d. per lb.
 Chloral Hydrate.—3s. 3d.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ether meth.—1s. 1d.—1s. 1½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—6s. 6d.—7s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 8d. per gal. f.o.r. makers' works, naked.
 Hydroquinone.—4s. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green. 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—22s. per cwt., 112 lb. lots.
 Magnesium Carbonate.—Light Commercial £33 per ton net.
 Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%; Heavy Pure 2s.—2s. 3d. per lb., according to quantity.
 Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 12s.—14s. per lb., according to quantity. Liquid (95%), 12s. per lb. Detached cryst., 15s. per lb.
 Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb., Levig. 6s.—6s. 1d. per lb.; Corrosive sublimate, Lump, 4s. 8d.—4s. 10d. per lb., Powder, 4s. 2d.—4s. 3d. per lb.; White precip., Lump, 4s. 10d.—5s. per lb., Powder, 4s. 11d.—5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d. per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide, 5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d. per lb.; Sulph. nig., 4s. 10d.—4s. 11d. per lb.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonol.—15s. 6d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—3s. 9d.—4s. per lb.
 Phenazone.—5s. 9d.—6s. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 82s. per cwt., less 2½% for ton lots. Dearer.
 Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
 Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6½d. per lb. spot.
 Quinine Sulphate.—2s. per oz.—1s. 8d.—1s. 9d. per oz. in 100 oz. tins.
 Resorcin.—4s.—4s. 3d. per lb. spot.
 Saccharin.—55s. per lb. Quiet.
 Salol.—3s.—3s. 3d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s. 1d.—2s. 2d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carriage paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—80s.—85s. per cwt. net, according to quantity.
 Sod. Salicylate.—Powder, 1s. 10d.—1s. 11d. per lb.; Crystal, 1s. 11d.—2s. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton, according to quantity, 1-cwt. kegs included.
 Sulphonol.—10s. 6d. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
 Thymol, Purif.—11s.—12s. per lb., according to quantity.
 Natural.—17s. 6d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.
 Anubine (*ex Anethole*).—10s. 6d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.
 Cinnamic Aldehyde.—Natural, 17s. per lb.
 Coumarin.—11s. per lb.
 Citronellol.—15s. per lb.
 Citral.—9s. 6d. per lb.
 Ethyl Cinnamate.—10s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa). 11s. per lb.
 Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Shui Oil*) 12s. per lb. (*ex Bois de Rose*) 16s. per lb.
 Linalyl Acetate.—(*ex Shui Oil*) 14s. 6d. per lb. (*ex Bois de Rose*) 18s. 6d. per lb.
 Methyl Anthranilate.—9s. per lb.
 Methyl Benzoate.—4s. 6d. per lb.
 Musk Ketone.—36s. per lb.
 Musk Xylol.—8s. 6d. per lb.
 Nerolin.—3s. 9d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—11s. per lb.
 Rhodinol.—28s. 6d. per lb. Safrinol.—1s. 6d. per lb. Terpineol.—1s. 6d. per lb. Vanillin.—17s. 3d.—19s. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—31s. 6d. per lb. Bourbon Geranium.—12s. per lb.
 Camphor.—63s. 6d. per cwt. Cananga, Java, 20s. per lb. Cassia, 80/85%, 8s. 6d. per lb. Cinnamon, Leaf.—5½d. per oz. Citronella.—Java 85/90%, 2s. 4d. per lb., Ceylon, Pure, 1s. 11d. per lb. Clove, pure—6s. 3d. per lb.
 Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 19s. per lb. Lemon.—9s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—9s. 9d. per lb. Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—10s. per lb. Peppermint.—Wayne County, 25s. 6d. per lb. Japanese, 9s. 6d. per lb. Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

THE Complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Mar. 7th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Jan. 20th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Allis-Chalmers Manuf. Co. Commminuting-mills. 32,842. Dec. 29. (U.S., 15.4.26.)
 Bargeboer. Regulating liquid level in evaporating-vessels. 32,908. Dec. 30. (Ger., 6.11.26.)

Dunsmore. Hydro-extractors etc. 32,922. Dec. 30.
 I.-G. Farbenind. Recovery of reaction products from gases. 32,947. Dec. 30. (Ger., 30.12.25.)
 Kuhn. Liquid separator. 32,800. Dec. 28.
 Loesche. Grinding-mills. 32,837. Dec. 29.
 Pahl. Filter sieves. 32,898. Dec. 29.
 Pasquiers. Drying-apparatus. 32,793. Dec. 28. (Fr., 28.12.25.)

II.—Complete Specifications

32,363 (1925). Baker Perkins, Ltd., and Pointon. Hydro-extractors. (263,303.)
 819 (1926). Lucas. Furnaces. (263,312.)
 6015 (1926). Fesca. Centrifugal separators. (263,348.)
 9516 (1926). Robertson (Power Specialty Co.). Furnaces. (263,369.)
 21,713 (1926). Svensson and Norling. Drums for centrifugal separating-apparatus. (263,443.)
 22,149 (1926). Mellvaine. Apparatus for determining the moisture content of masses of particles. (263,450.)
 *26,776 (1926). I.-G. Farbenind. Process for the detection of silicic acid gel. (263,483.)

III.—Applications

Asiatic Petroleum Co., Ltd., and Joyce. Oxidising heavy petroleum oils etc. 32,959. Dec. 30.
 Boscik, Hodler, and Maschinenfabr. Augsburg-Nürnberg. Carbonising-machines. 32,861. Dec. 29. (Ger., 30.12.25.)
 Evans (Kohlenveredlung A.-G.). Distillation of carbonaceous substances etc. 33,092. Dec. 31.
 Guertner. Distilling etc. coal. 32,862. Dec. 29.
 La Rillisiere. Cracking mineral oil etc. 33,066. Dec. 31.
 Tully and Yeo. Manufacture of gas for heating etc. 33,077. Dec. 31.

III.—Complete Specifications

27,972 (1925). Carr, Toogood, and Dempster & Sons, Ltd. Retort furnaces. (263,269.)
 11,078 (1926). Maze. *See* III.
 19,215 (1926). Norton. Washers for coal and the like. (263,422.)

III.—Application

Combustion Utilities Corp. Purification of tar oils. 32,978. Dec. 30. (U.S., 22.9.26.)

III.—Complete Specification

11,078 (1926). Maze. Purification and hydrogenation of liquid hydrocarbons. (263,381.)

IV.—Applications

Harris, Thomas, Wylam, and Scottish Dyes, Ltd. Dyes etc. 32,888. Dec. 29. Dyes etc. 33,064. Dec. 31.
 Hereward, Thomas, and Scottish Dyes, Ltd. Dyes etc. 32,887. Dec. 29.
 I.-G. Farbenind. Manufacture of thiomorpholines of the anthraquinone series. 32,839. Dec. 29. (Ger., 29.12.25.)
 Manufacture of alkynaphthalenes. 32,840. Dec. 29. (Ger., 29.12.25.)
 Manufacture of benzanthrone derivatives. 32,841. Dec. 29. (Ger., 30.12.25.)
 Manufacture of dyestuffs. 32,956. Dec. 30. (Ger., 30.12.25.)
 Kritchewsky and Prutman. 32,851. *See* VI.

IV.—Complete Specifications

9726 (1926). Carpmal (I.-G. Farbenind.). Manufacture of 1:4-diarylamino-5:8-dioxyanthraquinones. (263,370.)
 10,559 (1926). Carpmal (I.-G. Farbenind.). Reduction of aromatic nitro compounds. (263,376.)
 *32,301 (1926). I.-G. Farbenind. Manufacture of vat dyestuffs of the anthraquinone series. (263,494.)

V.—Complete Specification

25,081 (1926). Grunert. Producing artificial silk filaments. (263,462.)

VI.—Application

Calvert. Treatment of vegetable fibres. 33,005. Dec. 31.
Kritchovsky and Prutsman. Chemicals for colouring fabrics. 32,851. Dec. 29. (U.S., 5.5.26.)

VI.—Complete Specifications

23,475 (1925). Bedford. Dyeing artificial silk. (263,222.)
25,192 (1925). Tootal Broadhurst Lee Co., Ltd., and Foulds. Production of pattern effects on acetyl silk fabric. (263,248.)
26,576 (1925). British Celanese, Ltd., and Ellis. Dyeing, printing, and stencilling cellulose acetate. (263,260.)
28,282 (1926). Brit. Celanese, Ltd., and Ellis. Dyeing or colouring yarns, fabrics, etc. (263,473.)

VII.—Application

Clayton, Gibbs, and Salt Union, Ltd. Preparation etc. of sodium chloride compositions. 32,999. Dec. 31.

VII.—Complete Specifications

31,777 (1926). Soc. Anon. Le Salvoxy. Apparatus for the production of oxygen. (262,318.)
6,914 (1926). Brit. Celanese, Ltd. (Amer. Cellulose & Chem. Manuf. Co.). Printing fabrics and articles made of or containing cellulose esters or ethers. (263,355.)
*26,776 (1926). I.-G. Farbenind. See I.

VIII.—Applications

Bichereux. Manufacture of raw plate glass. 32,847-8. Dec. 29. (Ger., 30.12.25.)

VIII.—Complete Specification

16,557 (1926). Haddan (Corning Glass Works). Manufacture of glass or quartz transparent to ultra-violet light. (263,410.)

IX.—Complete Specifications

23,445 (1925). Lanhoffer. Preparation of raw materials for cement. (263,221.)
253 (1926). Thompson and McGivern. Bitumen emulsion. (263,308.)

X. Applications

A.-G. Brown, Boveri, et Cie. Electric smelting-furnaces. 33,070. Dec. 31. (Ger., 2.1.26.)
Beeston. Annealing-furnaces. 33,007. Dec. 31.
British Thomson-Houston Co., Ltd. Refining metals. 32,942. Dec. 30. (U.S., 31.12.25.)
Krupp Grusonwerk A.-G. Treatment of zinciferous flying dust. 32,876. Dec. 29. (Ger., 4.2.26.)

X.—Complete Specifications

9098 (1926). Greenawalt. Sintering apparatus. (263,363.)
15,090 (1926). Croy. Aluminium solder. (263,402.)

XI.—Applications

A.-G. Brown, Boveri, et Cie. 33,070. See X.
British Thomson-Houston Co., Ltd. Electric furnaces. 32,943. Dec. 30. (U.S., 31.12.25.)
Comp. Franc. pour l'Exploit. des Proc. Thomson-Houston. Electrodes for electric batteries. 32,829. Dec. 29. (Fr., 17.5.26.) Elements for electric batteries. 32,936. Dec. 30. (Fr., 2.7.26.)
Lucas, Ltd., and Young. Coating grids for electric accumulators. 32,806. Dec. 28.

XI.—Complete Specifications

6978 (1926). Shearman. Apparatus for the electrification of gases. (263,356.)
10,401 (1926). Turnauer. Electric batteries. (263,374.)

XII.—Complete Specification

2780 (1926). Barbet. See XVIII.

XIII.—Applications

McMinn. Auto-corrosive paint. 32,934. Dec. 30.
Quittner. Manufacture of elastic and waterproof coatings. 32,857. Dec. 29. (Austria, 30.12.25.)

XIII.—Complete Specification

13,529 (1926). Papeteries Navarre. Making solutions of resins. (263,393.)

XIV.—Applications

Cockerill. Apparatus for estimating amount of india-rubber in latex. 33,024. Dec. 31.
Grasselli Chemical Co. Vulcanisation of rubber etc. 32,895. Dec. 29. (U.S., 12.2.26.)
Staudinger. Manufacture of hydro-cyclo-caoutchouc. 32,957. Dec. 30. (Switz., 31.12.25.)
Williamson. Treatment of rubber. 32,918. Dec. 30.

XVI.—Application

Bennett. Treating seeds. 32,802. Dec. 28. (Australia, 26.3.26.)

XVI.—Complete Specification

2780 (1926). Barbet. See XVIII.

XVIII.—Application

Hansena A.-G., and Nathan. Filtration of beer wort etc. 32,795. Dec. 28.

XVIII.—Complete Specification

2780 (1926). Barbet. Treatment of residual liquors from the distillation of fermented liquids to obtain dry fertilisers and glycerin. (263,322.)

XX.—Applications

Chem. Fabr. Pott & Co. Condensation products of aromatic sulphonic acids. 33,071. Dec. 31.
Grasselli Chemical Co. Aldehyde amine condensation products. 32,896 and 32,897. Dec. 29. (U.S., 13.3.25.)
Grube and Osten. Production of highly-bactericidal non-organotropic substances. 32,929. Dec. 30.
Pope. Manufacture of ketones. 33,048. Dec. 31.

XX.—Complete Specifications

18,395 (1925). Caspari. Manufacture of oxygenated products from hydrocarbons or oxidisable derivatives of hydrocarbons. (263,201.)
559 (1926). Gammay. Production of camphene from pinene hydrochloride. (263,311.)
4308 (1926). Klaversteijn. Extraction of tartaric salts. (263,340.)

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Steam-driven briquette presses (A.X. 4071); Chemicals, raw materials for tanning, leather, textile, rubber, glass, paint and varnish industries, confectionery machinery, rubber manufacturing machinery (Commercial Bureau, Australia House, Strand, London, W.C., Ref. 414); *Austria*: Mica, micranite, oil insulation cloth and tapes, oil insulation silk (5); *Belgium*: Mechanical rubbers, packing (6); *British India*: Patent medicines, caustic soda (1); Asbestos sheets, wire woven glass (Madras & Southern Mahratta Railway Co., Ltd., 25, Buckingham Palace Road, London, S.W.1); saponified cresol, bismuth carbonate, bismuth salicylate, bismuth subnitrate, iodoform, iodine and potassium iodide (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1); *Egypt*: Asphalt (B.X. 3126); *Mexico*: Ink (B.X. 3127); *New Zealand*: Paper, drugs (3); *Poland*: Bronze wire, aluminium links, copper sulphate (A.X.

1019); *Rumania*: Non-ferrous metals, leather belting, lead, copper, zinc (12); *South Africa*: Cast-iron tanks (A.X. 4069); Wrought-iron pipes (A.X. 4061); *Salvador*: Galvanised iron corrugated sheets (18); *Sweden*: Chloride of lime, Glauber's salt, caustic potash, caustic soda, gypsum, rosin, china clay, potato starch (16).

Dyestuffs (Import Regulation) Act, 1920

The following statement relating to applications for licences under the Dyestuffs (Import Regulation) Act, 1920, made during December, has been furnished to the Board of Trade by the Dyestuffs Advisory Licensing Committee. The total number of applications received during the month was 552, of which 446 were from merchants or importers. To these should be added 11 cases outstanding on November 30 making a total for the month of 563. These were dealt with as follows: Granted 444 (of which 427 were dealt with within seven days of receipt). Referred to British makers of similar products 51 (of which 46 were dealt with within seven days of receipt). Referred to Reparation supplies available 3 (all of which were dealt with within two days of receipt). Outstanding on December 31, 1926 62. Of the total of 563 applications received, 178 or 85 per cent were dealt with within seven days of receipt.

Prohibited Exports

The Home Office has issued a list of goods the export of which from the United Kingdom is prohibited save under licence. Amongst these are to be found: Cocaine and salts thereof, and any substance containing not less than 0.1% of cocaine; depth charges and component parts thereof; diamorphine and salts thereof, and any substance containing not less than 0.1% of diamorphine; ecgonine and salts thereof, and any substance containing not less than 0.1% of ecgonine; explosives, with certain exceptions; heroin, morphine and salts thereof and any substance containing not less than 0.2% of morphine and opium (raw opium and medicinal opium). The exportation of opium prepared for smoking is absolutely prohibited.

Trade Notes

Thomas Broadbent & Sons, Ltd., of Huddersfield, have opened an office at 65, Bath Street, Glasgow, under the management of Mr. Eden Field.

The Pulsometer Engineering Co., Ltd., has received an order from the London and North Eastern Railway Co. for the supply and erection of four "Pulsometer" double-unit turbine centrifugal pumps, two delivering 800 gals. of water per min. against a total head equivalent to a pressure of 850 lb. per sq. in., and two delivering 600 gals. per min. against the same head. In addition, two return water pumps delivering 3000 gals. per min. against a total head of 14 ft., meters, pipes, valves, etc. are included in the contract. A similar plant was supplied to the Great Western Railway.

Fine Chemicals

One of the publications for which one looks early in the new year is the "Catalogue of B.D.H. Fine Chemical Products," issued by The British Drug Houses, Ltd. The new issue now to hand contains a remarkable list of chemical products of every kind, and should form part of the library of every laboratory. The catalogue opens

with a list of organic and inorganic chemicals, which covers no less than 76 pages; then follow lists of liquids of known refractive index; of analytical reagents which conform to the standards of purity given in "The B.D.H. Book of A.R. Standards"; of solutions and chemicals for volumetric determinations, both of general and special nature; of indicators for the determination of p_H , including the B.D.H. Capillator, Comparator, soil-testing outfit, universal indicator, and so on; of stains, mounting media and other requisites for microscopic work; of aniline dyes; and of minerals. The catalogue covers products so diverse as reagents for blood testing, Ridsdale's analysed samples for students in metallurgical analysis, "Sira" adhesive wax and crystals for wireless; but the most comprehensive assembly of pure chemicals for research and analytical work of every kind is attraction enough.

No. 3

EDITORIAL

Fuel Research

THERE are many points of interest in Dr. E. W. Smith's paper on "Some aspects of the fuel problem," which we publish in this week's issue. In the first place we are comforted by his observations that there is no shortage of research work and research workers in fuel, that there is no deficiency in the number of periodicals relating to fuel, and that there are plenty of trained men for research. There are a dozen organisations dealing with fuel research, including the Institution of Gas Engineers, the Coke Oven Managers' Association, and the Fuel Section of the Society of Chemical Industry, which three have formed a joint committee; there are fuel departments in the Universities of Leeds, Sheffield, Manchester, Birmingham, and the Imperial College of Science, and Dr. Smith proposes that a Federal Fuel Council should be formed of representatives of these eleven organisations and five fuel departments. There is already a tendency to closer co-operation between these bodies, and Sir Alfred Mond is arranging a fusion between the Institution of Fuel Technology and the Institution of Fuel Economy Engineers. For details of Sir Alfred Mond's views on some of the aspects of the fuel problems we must refer our readers to Dr. Smith's paper. Apart from the economic and industrial aspects of fuel there is the very important question of hygiene and the pollution of the atmosphere. That much remains to be done is shown by the recent report of the Advisory Committee on Atmospheric Pollution issued by the Meteorological Office of the Air Ministry. It appears from this report that Newcastle-on-Tyne is raised to the bad eminence of an air which contains more solid matter than that of any other city in the United Kingdom. The solid matter is measured in metric tons per hundred square kilometres and the figures of some towns are very great. Newcastle has 37,000 tons of solid per hundred square kilometres, Burnley 34,000, Rochdale 26,000, Liverpool 25,000, Wakefield 22,000. London varies very much,

some parts having 17,000 tons, others about 10,000 tons, while the suburbs have less. Birmingham enjoys 13,000 tons, Glasgow 10,000, Edinburgh 5000, and Leeds 3000. As the Society is to hold its Annual Meeting this year in Edinburgh, it is pleasant to find that this beautiful and historic city is also clean and clear.

The Electro-deposition of Rubber

The study of the electrical charges at the surfaces of colloidal aggregates has been applied to technical cataphoresis by the Electro Osmose Co. in recent years. More recently, however, anaphoresis has become a practical issue. The negative charge upon finely dispersed rubber particles causes them to migrate to the positive pole or anode in an electrical field, so that a film of rubber may be produced thereupon. The practical difficulties associated with the formation of a tough, coherent film have been largely solved by extended research, and the various anode rubber companies in this country and on the continent, with which are associated the Dunlop Rubber Co. and the Goodrich Co. of America, are actively preparing for full technical exploitation of the process. Not only may natural rubber suspensions—rubber latex

be employed in the deposition bath, but also artificial emulsions. In both instances, sulphur, compounding ingredients, and vulcanisation accelerators may be dispersed in the emulsion of rubber so that the film deposited may be subsequently vulcanised. Anodes constructed in metal or porous porcelain may be employed, in the latter case the electrical circuit being completed through the agency of electrolytes. After controlled deposition of the film of rubber, the coated anode may be removed, dried, and the rubber vulcanised *in situ*. Later, if desirable, the anode mould may be stripped. It is clear that the process allows of the manufacture of rubber-coated metallic apparatus for the chemical industry—tanks, pipes, and so on—as well as metallic wires covered with a perfect, strong, insulating sheath of rubber. In addition, by the use of suitable

anode moulds passing continuously through the process of deposition, drying, vulcanising and stripping, such articles as inner tubes, gloves, tobacco pouches, and sheet rubber goods may be made. Further, fabrics waterproofed by rubber deposition may find important applications in the motor industry. We have never swerved from our conviction that fundamental research, the practical application of which may or may not be envisaged by the investigators, is essential to the progress of the chemical and allied industries, but it is refreshing occasionally to remind ourselves, with the aid of examples chosen from recent developments, of the earning power of research.

The Earning Power of Research

We hope we shall not be charged with debasing the pure gold of true research if, borrowing a title from a worthy American contemporary, we refer to some recent instances which show that the manufacturer often sees such a return upon his investment in research as to make its active prosecution a very definitely justifiable speculation. Not only does the enlightened industrialist realise the true value of scientific research, but the general public, through the agency of such lectures as have recently been broadcast by Professor W. L. Bragg, is being initiated into the mysteries and consequences of this advancing form of human activity. There must be few chemical manufacturers to-day who fail to realise that the work of such men as Deville, Tellier, Ramsay and Young, and Le Châtelier laid the foundations of the synthetic ammonia industry long before Haber commenced his work. The manufacture of thousands of tons a year of synthetic acetaldehyde and acetic acid would have been impossible without the academic investigations of Lagermark, Eltekow, and Kutschew, whilst no margarine maker could have dreamt of hydrogenated oils when Sabatier was reporting experiments on the action of finely divided metals upon gases containing not a millilitre of hydrogen. Did Ramsay and Travers ever contemplate helium-filled airships or neon-filled electric bulbs when they were scoring delights and living laborious days in search of the rare gases? The appearance in a Swiss contemporary of a further paper on muskone, the perfuming constituent of natural musk, has given us an up-to-date instance of the earning power of research and of the value of co-operation between industrial and academic chemists. As a result of many years of intensive research, carried through in the laboratories of several continental universities and of an important Swiss firm manufacturing synthetic perfuming materials—researches which have involved the expenditure of tens of thousands of pounds—synthetic muskone has been placed upon the market. For many years artificial musks such as those of Baur have been used in large quantities, but these compounds of the synthetic chemist have never replaced natural musk, the essential component of which, muskone, was well known to be entirely different from the artificial musks, tri-nitro butyl toluene and the like. The study of natural muskone, which is only obtained in about one per cent. yields from the scarce and expensive animal musk, and of civetone, which can be won more cheaply and in greater quantity from civet, inspired synthetical experiments into the

making of multi-carbon ring ketones, as an outcome of which synthetic muskone and civetone have been produced in the factory. Muskone, *cyclo-pentadecanone*, appears fortunately to be the sole perfuming constituent of natural musk, so that the synthetic product should have to overcome no such prejudices as stood in the path of synthetic indigotin or vanillin, which, although representing the essential constituents of natural indigo and vanilla beans respectively, were—and often still are—held to be deficient substitutes for the products of *Deus* Nature. If synthetic muskone brings as rich a reward to its creators as did indigotin and vanillin to theirs, the earning power of research will prove once more to be no mere high-sounding slogan of a simple souled, commercially inept chemist.

The Centenary of Aluminium

This year of grace marks the completion of one hundred years since Wohler isolated aluminium in metallic form. At least it is generally accepted that the honour belongs to Wöhler, although evidence has been put forward in support of Oersted, who is reported to have obtained metallic aluminium some years previously, in 1824. It is not for us, however, to adjudicate upon claims of priority, nor does it concern us very much, as aluminium was not produced in quantity until 1854 when Sainte-Claire Deville made the metal by reducing aluminium sodium chloride with metallic sodium. In 1859 a factory was established in Battersea, London, and later small quantities were made in Warrington. Commercial manufacture, however, can only be said to have begun in 1886, when Cowles introduced his process, in which alumina was reduced by carbon in the presence of copper in an electric arc furnace. The sodium reduction process gained a new lease of life when the price of sodium was reduced on the advent of the Castner process, but all these processes had to yield finally before the application of what was then a new process to metallurgy—the use of electricity for the reduction of metals, as exemplified by the Hall and Heroult processes for the electrolytic manufacture of the pure metal. It is interesting to observe the development of production since the early days of Deville's process, when aluminium cost £18 a pound. During the period 1885 to 1900, the total world production was about 10 million pounds, and during the period 1901 to 1910, the output rose to 300 million pounds. Since then the production has increased enormously, the world output in 1926 being some 170 million pounds: 230 million pounds in Europe, 240 million pounds in the States and Canada. Although aluminium is one of the commonest elements in the earth's crust, it is one of the most recent metals to attain great industrial importance. As a material of construction, it has gained its place, and even greater developments may be expected from the use of its alloys, which so conveniently combine strength and lightness. Metallurgically, it is of great interest, and much investigation still remains to be carried out. Its uses are endless, and the chemical industry, which utilises so much plant made of the versatile metal, does not bear the least debt to the pioneers who made its manufacture commercially feasible on so large a scale.

SOME ASPECTS OF THE FUEL PROBLEM*

By E. W. SMITH, D.Sc., F.I.C.

The Samuel Commission, followed by the Coal Strike, has further stimulated the interest that was developing in connexion with the study of fuel problems. It is undoubtedly a fact that "the man in the street" has to-day a much clearer conception of the importance of the subject of fuel than at any previous time.

It can be said that there is only one fuel problem, and that is how to produce fuel at a lower cost, for industry and otherwise. All other problems are subsidiary, though important and complementary to this main problem.

It is really the subsidiary problems on which I propose to touch this evening. Broadly speaking, these subsidiary problems can be divided into three groups: Technical, Economic and Hygienic. Another system of sectionalisation might be Coal Raising, Coal Preparation and Coal Utilisation.

From a technical point of view, and indeed from every other point of view, it is fundamental to the whole fuel problem that there is required all through the fuel industry, in all its branches, a much higher standard of technical knowledge. It is not sufficient that boys and men shall merely have a "good education," or that they shall have a scientific training, or that they shall have a practical experience. Study and education in fuel should be taken seriously, and not treated as an "extra" subject, tacked on to an otherwise general education. The subject of fuel is broad enough and deep enough to justify its presence in the curriculum of all technical schools, colleges and universities. It is the most fundamental subject of our industrial and domestic life. The rudiments and preliminaries are worthy of some treatment even in our elementary schools. It is relatively useless to devote the whole of technical development as regards fuel to research, if those who have to take advantage of the research that is done are not capable of giving such researches the intelligent consideration which should come from minds trained in the subject of fuel.

I therefore differentiate between what is being done in the teaching of fuel subjects, and what is being done in research. There are two distinct lines of development—namely, the training of the fuel technologist, and the utilisation of the fuel technologist in research and control.

It is well known that scientifically trained men can specialise in fuel, and take training courses at some of the modern universities. It is rare to find that there are courses of a co-ordinated nature spread over a period of years in many of our technical schools. It is rarer still to find that fuel is dealt with in any way at our public schools, secondary schools, or the elementary schools. I am fully aware that individual items can be indicated as having a bearing on fuel, such as the subjects of heat and light, but to my mind that is not enough.

There would appear to be no shortage of research work and research workers in fuel. The Fuel Department of the Leeds University specialises in the problems relating to the gas and coking industries. That University would

appear to be the first to raise the subject to the status of a Degree. Sheffield University specialises in the problems relating to the mining and coking industries. Birmingham University is dealing more particularly with petroleum and coal treatment. The Imperial College of Science concentrates on important fundamental problems. The Fuel Research Board is directing valuable work on many subjects relating to fuel, from a survey of the coalfields to carbonisation and hydrogenation. Their work is not confined to the Fuel Research Station, but their men can be found in many of the universities carrying out specialised work under the direction of the Director of Fuel Research. Valuable work is also being carried out of a specialised nature for different industries. The Federation of Iron and Steel Manufacturers has its Fuel Division; the Federation of British Industries also has its Fuel Division. The Association of leading firms in Lancashire and Cheshire has its research organisation.

The work that is being done in all these important directions is available in the main to the community at large. The results can be found published in the Transactions of various institutions, in the reports of some organisations, and in the technical Press. There is no deficiency in the number of periodicals relating to fuel.

There would appear to be any number of trained men for research. One of the problems of the immediate future would seem to be the creation of a more positive directive power, having for its primary object a greater co-ordination of research, research workers, and the technology of fuel.

The Society of Chemical Industry has always had its doors open to fuel subjects. It has always been recognised that without fuel there would be no chemical industry. Chemical industry, as understood to-day, may cover every conceivable national industry, because if any industry is to be run under the best commercial conditions, it has a chemical side to it which must not be neglected.

During recent times, when the difficulties connected with coal have become accentuated, all interested in the subject have given thought, from time to time, to improved means of organising public interest; getting improved co-ordination amongst producers and users, a greater pooling of results of research work, and many other topics connected with fuel. This has borne fruit in the inauguration of a number of technical institutions.

Some of us in the Society of Chemical Industry felt that before any elaborate step should be taken in the formation of any new society, it would be necessary to take thought as to the most important primary objectives, and determine what facilities were available for bringing about the desired results. Very careful consideration was given to the advisability or otherwise of forming a new institution. There was never any fundamental objection to a new institution as such, and there is not one to-day, so far as I am aware. It was felt, however, that the Society has an obligation and a duty to its own members. Fuel is as much a chemical subject as any other that can be mentioned amongst the Society's activities. The Society has a membership of about 4800. These members are spread over the British

* Paper read before the Glasgow Section on Dec. 15, 1926. Mr Langlands presiding.

Isles and the Empire. In Great Britain alone it has 11 local sections, highly organised, active, and mainly interested in the subject of fuel. It was, therefore, decided that the Society's contribution to a solution of the fuel problem would be to use its Local Sections and membership in the development of a systematic co-ordination and treatment of fuel topics at its meetings. This has been done by the formation of a Fuel Section which, on behalf of the Council and those members who are more particularly and directly interested in the subject of fuel, arranges conferences on special matters, and papers and lectures for Local Sections when necessary. So far the Committee has been appointed by the Council. It is intended that, later on, each Local Section shall be represented on the Committee. In the meantime, very successful conferences have been held on the subjects of Free-Burning Smokeless Fuel, and Tar, and a congress is being organised in connexion with the carbonising industries.

In order to prevent overlapping, and to encourage co-ordination, a Joint Committee of the Fuel Section of the Society of Chemical Industry, the Institution of Gas Engineers, and the Coke Oven Managers' Association has been formed to run these National Congresses, and the latest development is the close co-operation of this Joint Committee with the English Section of the World Power Conference, which is holding a meeting on the subject of Fuel in the autumn of 1928.

Anyone who has read the inspiring and illuminating Presidential Address of Sir Alfred Mond, delivered the other day at the annual meeting of the Institution of Fuel Technologists, will be struck by the insight into the fuel problem displayed by Sir Alfred. He is also chairman of the National Fuel & Power Committee, set up by the Board of Trade, which has for its objective: "To consider and advise upon questions connected with the economic use of fuels and their conversion into various forms of energy, having regard to national and industrial requirements in the light of technical developments."

Sir Alfred urged the need for the co-ordination of the work and activities of all institutions interested in fuel. As a start, he was arranging the fusion between two Institutions of which he is president—the Institution of Fuel Technology and the Institution of Fuel Economy Engineers. He hoped that the Fuel and Power Committee, of which he was chairman, would be a big force in bringing about this co-ordination.

There is no doubt that co-ordination amongst institutions, and particularly institutions relating to fuel, is required. It will never be possible, however, for one institution to represent all fuel interests. It is not conceivable that the Institution of Gas Engineers, or the Coke Oven Managers' Association, or even the Society of Chemical Industry, will sink its identity in the Institution of Fuel Technologists, whether each of these Institutions is represented on its Council or not. An Institution has to be one of two things for it to be truly representative. It shall either represent individuals only, or shall represent institutions only, and if it be the latter, then it immediately becomes a Federal Council.

For some time I have felt very strongly that it would be of national advantage if a Federal Fuel Council were to be formed, representative of other Institutions and

Research Organisations. Its chairman could be the chairman for the time being of the National Fuel and Power Committee. Its vice chairman could be the Director of the Fuel Research Board. Each of the following institutions could, with advantage, be represented on this Council:—

- The Institution of Gas Engineers.
- The Coke Oven Managers' Association
- The Institution of Mining Engineers
- The Fuel Section of the Society of Chemical Industry.
- The Institution of Petroleum Technologists
- The Institution of Fuel Technologists.
- The Institution of Fuel Economy Engineers.
- The Institution of Electrical Engineers.
- The Fuel Research Board
- The Fuel Division of the National Federation of Iron and Steel Manufacturers
- The Fuel Division of the Federation of British Industries.
- The Safety in Mines Department
- The Fuel Departments of the following Universities: Leeds, Sheffield, Manchester, Birmingham, and the Imperial College of Science

The primary function of the Federal Fuel Council would be to make joint representation on all matters where joint representation is desirable, and to act in an advisory and co-ordinative capacity on request from sectional interests.

In the meantime the Fuel Section of the Society of Chemical Industry will carry on its work of co-ordination and co-operation in the creation of a 'Fuel Sense' in all industries, and a greater appreciation of the importance and possibilities in the study of fuel by all concerned. It is not desirable that out-and-out bureaucratic methods, through intensive organisation, should be tolerated, but there is a big gap between the chaos that is possible and bureaucratic control, and it is that happy medium, allowing full play to individual initiative and effort, which is the end that is desired.

From the publicity that has been given to the subject in recent years, it would strike a visitor from Mars that the subject of low-temperature carbonisation is one which is of the most fundamental and primary importance to the British fuel industries. On this subject Sir Alfred Mond states that he feels that although the production of oil from coal is not necessarily an economic proposition, it should be pursued in order that the country could be in the position of economic independence of outside oil supply. This appeared to him to be a matter of ever-increasing importance with the increase of the mechanisation of modern warfare, and the greater the quantity of oil obtainable in this country the greater would be our stability.

Whilst agreeing with Sir Alfred in every respect on this matter, it is necessary to point out that the conditions he lays down entail Government control and Government subsidy. There is no doubt that there is every justification for the development of even uneconomic processes if it can be demonstrated that enough fuel oil can be obtained at reasonably short notice from home sources of raw materials. I would suggest, however, that the matter be placed on a par with the

production of toluene during the war. All the details can be worked out, a full-scale plant can be operated, and preparation made for extensive production in case of eventualities, such operations to be put into force immediately the necessity arises. In the meantime, oils can be, and are being, produced in large quantities from the normal processes of carbonisation. Such processes as the Bergius process can be fully developed whether economic or not, but I submit that this is not a subject which the main fuel interests can develop, but one which specialised men shall undertake on behalf of the State.

Another matter of primary importance to industrialists, with which Sir Alfred dealt, was his point of view that research should not be paid for out of profits, but should be regarded as capital expenditure. If industrialists could be brought to the same point of view, a radical change would immediately take place in their attitude towards research. It is a great deal easier to bring about development out of capital than out of revenue. It places a much greater responsibility on the research workers—a responsibility which is salutary and beneficial in every respect. Research needs to be organised on business lines like any other activity in industry, and this does not need to interfere in any way with the efficiency, independence, and individuality of the research workers. It presupposes the right attitude of mind in a chairman of directors, and a breadth of view which is not over-frequently met with.

Lastly, one of the problems, and not the least important in connexion with fuel, is that of its hygienic utilisation. Pure water is an essential of life. Pure food is largely ensured by the State, but the most important of all—*pure air and unadulterated sunlight*—are treated as matters of secondary importance. One does not need to be a fanatic on this subject to realise, after but little study, that if the use of coal in a raw state were to be forbidden, then the productivity of the individual worker would be considerably increased with the same effort expended, which increase would correspond in national wealth to something commensurate with the amount of the Budget. Consequently, one of the most important fuel problems is to develop means for the utilisation of coal which are non-smoke producing. A great deal has been done, but much remains to be achieved. This is a matter which requires the co-operation of the public, and this co-operation cannot be attained without much propaganda and education. Concentrated effort is needed on the part of all industrialists on this problem. The aim should be the elimination of the direct use of raw coal for all purposes in which there is a danger of the production of smoke.

I think I have said enough in a very general way to indicate some of the directions—on broad lines—in which progress can be made. The Local Sections of the Society of Chemical Industry have a great responsibility in this matter. They can be the local centres for the dissemination of knowledge, the nuclei for the creation of co-ordination and co-operation, and the inspiration for a higher civic duty in the alleviation of those evils which are created through the inefficient use of the nation's most valuable asset.

IMPROVEMENTS IN AND IN CONNEXION WITH DIAPHRAGMS TO BE USED IN ELECTRIC BATTERIES*

By M. WILDERMAN, Ph.D., B.Sc.

All chemical reactions in an accumulator take place at the surface of contact of the sulphuric acid with the solid sponge lead and lead peroxide, as well as with the solid PbSO_4 which separates on the electrodes. The acid in contact is the first to take part in the reaction, becoming more dilute during discharge and more concentrated during charge, than the acid which is more removed from the electrodes. Diffusion then supplies the H_2SO_4 from the more concentrated acid between the electrodes, to the less concentrated acid at the surface of contact with the electrodes, and diffusion again conducts the H_2SO_4 away from the electrodes during charge to the layers of the acid which are more removed from the same. Diffusion being, however, a very slow process, it cannot supply or remove the H_2SO_4 to or from the electrodes with the same speed as it is removed by the current from the solution, or is increased at the surface of the electrodes. Thus the acid in contact within the electrodes is diluted considerably during discharge, or is enriched unduly quickly during charge, and this takes place all the more the greater the current densities used. On account of this, during discharge the voltage and with it the ampere-hr. and watt-hr. capacity drop considerably, on account of the fall in the concentration of the acid in contact with the electrodes, and this drop is greater the higher the current densities. There is only one way to increase and improve the voltage, the A.H. and W.H. capacity for different current densities, the speed of recovery, etc., during discharge, and this is to increase the concentration of the acid at the surface of the electrode by introducing an automatic mixing and circulation of the electrolyte between the electrodes. For this a hydrostatic and an increased electro-osmotic pressure are purposely created between the electrodes by means of a diaphragm of special construction and porosity.* The invention also comprises the use of non-compressible separating frames, together with the said diaphragms, with various features and details of construction and arrangement of the accumulator for obtaining the object in view.

To carry the invention into effect, a number of conditions must be complied with:

1. A diaphragm, not a perforated sheet, must be used as a separator, in order that a hydrostatic and an electro-osmotic pressure be created between the electrodes.

2. It is necessary that the separators be constructed in such a way that the solution between the electrodes is unequally distributed between the two electrodes and the separator. The number of molecules of H_2SO_4 which are taken away from the solution during discharge at each electrode, or sent into the solution during charge is the same. If the amount of the solution between the diaphragm and one electrode is greater than the amount of the solution between the diaphragm and the other electrode, the concentration during discharge remains greater at the first electrode than at the second, and a

* Patents No. 100,577, 1922 and No. 245,252, 1924

hydrostatic pressure is thus created from the one side of the diaphragm to the other.

The best conditions of this subdivision of the electrolyte between the two electrodes depend on the variation of the volts, with the variation of concentration of the acid at each electrode, which with the lead accumulator is greater for the positive electrode. For this reason, more solution should be arranged at the positive side of the diaphragm than at the negative side. On the other hand, it is also essential to leave at the negative side of the diaphragm the necessary free space between the diaphragms and the negative electrode to enable such a circulation of the solution between the diaphragm and the electrode.

3. Since the spaces between the separator and the electrodes are very small (1 mm. and less), the separators must be so constructed and be of such properties that the subdivision made should remain constant. For this purpose the separators must be supplied with a non-compressible frame of special construction, capable of effectively counteracting the bending and buckling of the electrodes, and the porous diaphragm itself must be placed in such a position within the frame, so that, whether the frame and the diaphragm form one piece or not, the solution is distributed between the electrodes as may be desired. The frame and the diaphragm themselves must remain unaffected by the electrolyte or by the gases evolved in the battery, and must not be compressed by the electrodes during discharge.

4. The diaphragm must have a great speed of percolation in order that the small value of the hydrostatic pressure and of the electro-osmotic pressure shall suffice to produce an effective circulation of the electrolyte from one side of the diaphragm to the other, which alone is capable of mixing the whole solution between the electrodes with the thin layers of the solution at the surfaces.

The speed of percolation entirely depends upon great porosity and a sufficient radius of the capillaries in the diaphragm. Careful investigations extending over long periods and made with numerous samples have shown that the speed of percolation through an ebonite diaphragm made of a powder (grain 0.9 mm.) and of a porosity of about 50%, is about 40,000 to 100,000 times as great as that of the wooden diaphragms of the same thickness, and about 5000 times as great as that of an earthenware diaphragm used in the Leclanché cells, and about 1000 times as great as that of the threaded rubber separator after this has been in water or acid solution for a few days.

Let us now see how this affects the problem of making the hydrostatic and the electro-osmotic pressure effective for producing a circulation and mixing of the solution between the electrodes. Take, for example, an accumulator for 60 A.H., consisting of 5 positive and 6 negative electrodes, each 13 cm. high and 14 cm. wide.

The total surface of the 10 diaphragms in such a battery will be 1820 cm.² Since the specific gravity of the acid used must be 1.25--1.3, the over-pressure of the acid from the positive side of the diaphragm to the negative side will be equal at most to about 3 mm. water at the top and 3 cm. water at the bottom of the diaphragm.

The speed of percolation through a treated wooden diaphragm 0.9 mm. thick and of about 20 cm. surface was found to be, under a pressure of 107 cm. water, equal to 0.14 c.c. per minute.

It follows from this that under the hydrostatic pressure given above only about 9--10 c.c. of the solution can pass per hour through the surface of the 1820 sq. cm. of the 10 wooden diaphragms, or about 0.0001 c.c. per minute through a surface 1 cm. square. This is so little that we can hardly even call it a sweating of the solution from one side of the diaphragm to the other. No circulation takes place here. On the other hand, by using an ebonite separator having a speed of percolation which is 40,000 or 50,000 times greater than that of a wooden separator, about 400,000 c.c. of the acid will pass per hour or 6660 c.c. per minute under the very same conditions of pressure (3 mm. water pressure on the top and 3 cm. water pressure at the bottom of the diaphragm) from the positive side of the separator to the negative side. Since the total amount of the solution, that which is between the electrodes (2.5 mm. apart), and that within the 10 diaphragms of 50% porosity is about 312 c.c., it follows that the total amount of the solution between the electrodes will pass through the 10 ebonite diaphragms about 20 times per minute. Under such circumstances there can be no doubt that in this case a *true circulation and mixing* of the solution between the electrodes through the diaphragm takes place.

The circulation created in the above manner automatically adjusts itself to the needs of the battery; the higher the current densities the quicker the acid weakens in the unit of time at the surface of contact with the electrodes, the greater also becomes the difference in the concentration of the solution on both sides of the separator, and with it the greater the value of the hydrostatic and the electro-osmotic pressures, and the greater the speed of percolation and mixing of the solution.

The above is fully illustrated by the following results obtained with two 60 amp.-hr. batteries of exactly the same capacity, one with treated wooden separators, one with Wilderman porous ebonite separators (referred to hereafter as "Wilderman separators"). Discharges were made with 6, 30 and 45 amperes between the same equi-potential lines. The two batteries were first fully charged until the total volts, 2.60 to 2.65 per cell, and the single potentials (plus cadmium and minus cadmium readings) were the same, while the acid concentration and its temperature were kept equal; they were then left to stand in open circuit for about 12--18 hours, all the values mentioned remaining equal for both cells, the concentration of the acid and its temperature being adjusted if necessary. The two cells were then discharged separately or in series, until each of them reached the same 1.8 volts, the normal limit of discharge.

Discharge with 6 amperes

After the batteries were fully charged they gave during charge: -

	Ex. Wooden Separators	Wilderman Separators
Total volts	2.60	2.60
Negative cadmium	-0.12	-0.13
Positive cadmium	+2.46	+2.46

The acid was adjusted at the end of charge while still "gassing" and the batteries left to stand 12 hours on open circuit.

On open circuit immediately before discharge, the following data resulted:—

	Ex Wooden Separators	Wilderman Separators
Total volts	2.06	2.22
Negative cadmium	0.06	0.06
Positive cadmium	2.26	2.28
Acid sp. gr.	1.20	1.285
Acid temperature	18.2° C	18.2° C

Discharges with 45 amperes

From diagram XXIX a discharge with 45 amperes may be seen. The abscissa gives the time in minutes; the ordinate on the right the amperes and the ordinate on the left the volts. The curves on the diagram show the value of the amperes and the volts obtained with the two batteries during discharge. The top curve Ex and W XXIX' gives the amperes during the discharge of the two batteries in series, one with treated wooden

The two batteries down to 1.8 volts, obtained

then separately discharged the following results were

	Ex Wooden Separators	Wilderman Separators
Initial volts	2.14	2.16
Time to reach 1.8 volts	10.96 hrs	11.61 hrs
Average amperes	6.40	6.0
Ampere-hours	56.84	69.7
Watt hours	135.10	143.36

Discharge of about 30 amperes, carried through mentioned above, gave:

	Ex Wooden Separators	Wilderman Separators
Initial volts	2.02	2.05
Time taken to reach 1.8 volts	52.5 min.	59.0 min
Average amperes	28.95	30.7
Ampere-hours	25.23	30.55
Watt hours	49.54	60.82

A great number of similar results were obtained with discharges of different amperes.

separators, denoted by Ex., the other with Wilderman separators denoted by W. The amperes started with 42.5 and gradually dropped as the volts of the two batteries dropped. The amperes and the volts of the two batteries were read at the same time. The second curve from the top W XXIX' gives the corresponding volts of the battery with the Wilderman separators. The third curve from the top Ex XXIX' gives the corresponding volts of the battery with the wooden separators.

It is thus seen that it took 61 minutes for the battery with the wooden separators, and 70 minutes for the battery with the Wilderman separators to reach on discharge 1.8 volts, and during these times 46.63 amp.-hr. and 92.7 watt-hr. were taken out from the battery with the W separators, and 40.93 amp.-hr. and 80.66 watt-hr. from the battery with the wooden separators. After

60-7 minutes the voltage of the battery with the wooden separators fell to 1.12 volts, while the voltage of the battery with the W separators was still 1.82 volts.

The batteries were allowed to stand *in open circuit*, the battery with wooden separators 10.6 hours, with the W separators 9.8 hours to recuperate, until they both reached the same voltage (2.11 volts), and then separately discharged, starting with the same amperes the wooden separators 25.9 amperes and the W separators 26.32 amperes. Curve WXXX¹ gives the amperes with the W separators and curve WXXX² the corresponding volts. Curve ExXXX¹ gives the amperes with the wooden separators, and ExXXX² the corresponding volts. We find that although more ampere and watt-hours were taken out from the battery with the W separators during the first discharge, yet after recuperation it again gave higher volts and amperes and watt-hours (9.28 amp. hr. and 17.81 watt hr.) than the battery with the wooden separators (which

battery of 60 amp.-hr., cover more than the whole field of current densities which can possibly be used in accumulators for comparatively long periods of time, such as for lighting or power. Higher currents such as 100-300 amperes for a 60-ampere hour battery are only used for very short periods, fractions of a minute, as in the starting of a motor car. In such cases the time is too short for the circulation of the solution to become effective, and the rapid drop in the concentration of the acid in contact with the electrodes is unavoidable. Nevertheless, the circulation is of great importance also here, as it enables a much quicker recovery of the battery.

When quick discharges with higher currents are made, it is the resistance introduced by the separators which becomes of importance, the diminution of the volts during discharge due to the resistance being directly proportional to the same, and to the current of discharge used. The following table gives the resistances introduced by the different kinds of separators for a section

No.	Wilderman separator put dry into the acid of 1.275 sp. gr.			New Ex wooden treated separators put damp into acid of 1.275 sp. gr.			New threaded rubber separators put dry into acid of 1.275 sp. gr.			New Honduras Cedar wooden separators non-treated put dry into acid of 1.275 sp. gr.

only gave 6.3 amp.-hr. and 11.9 watt-hr.), the voltage being allowed in both cases to drop to 1.00 volts. In the battery with the wooden separators the volts dropped to 1.00 after 25 1/2 minutes while for the same time the volts of the battery with the W separators was still 1.66. This proves that the speed of recuperation is also much quicker and more complete with the W separators than with the wooden separators.

It will be noticed that although we had the same capacity, the same volts, the same single potentials, the same concentration and temperature of acid during charge and in open circuit after many hours' standing, yet the battery with the Wilderman separators showed higher voltage as soon as the discharge was started, and during discharge. This is evidently due to the acid circulating between the electrodes in the Wilderman separators and not doing so with the wooden separator.

The influence of the resistance introduced by the separators upon the volts when smaller current densities are used is small, as will be seen later on. The current densities used in this test, namely, 6-45 amperes for a

of 11.7 cm.² of the separator. The measurements were made with a battery acid of 1.275 sp. gr., using the well-known method of Kohlrausch. To get the resistance introduced by the ten separators of the 60 amp.-hr. one-cell battery, it is necessary to divide the value of the resistances obtained for 11.7 cm.² by 150 for the wooden separators and by 130 for the Wilderman and threaded rubber separators thus taking into account the actual surfaces of the diaphragm in each case.

The data given in the above table gives the resistances obtained with different separators when they are new. While the Wilderman separators remain unattacked by the acid and the gases evolved in the battery, this is not so with the wooden and threaded rubber separators. In the above table, the resistances introduced by the different separators are also expressed in mm. thickness of solution. There is also given the total increased resistance of the solution between the electrodes due to the introduction of the different separators, for a battery having the electrodes 2 1/2 mm. apart, expressed in mm. thickness of solution. The values given in the

above table are at 17° C. (62-60 F.). The differences between the resistances introduced by the different separators become more and more prominent the lower the temperature. They are considerably greater at -10° C. (14° F.) than in the above table.

From the above table it follows:—

1. After 5 minutes the Wilderman separators put dry into the acid give resistances which are 4-5 times less than those of the treated wooden separators used wet, about 18 times less than the non-treated wooden separators, and about 3-4 times less than the threaded rubber separators also used dry.

2. The resistances of the Wilderman separators were after 4½ days' immersion in acid 2.8 times less than those of the wooden separators, 4 times less than those of the non-treated wooden separators, and 2.2 times less than those of the threaded rubber separators after these had been in acid for many days until they reached their permanent minimum resistance. The resistances of the treated wooden separators vary considerably one from another, owing to the fact that the wooden separators, being of a cellular construction, do not represent a true porous body. For this reason the different electrodes in the same battery using wooden separators work with different current densities.

3. The non-treated cedar wooden separators are much worse than the treated wooden separators; they require a very long time to reach their minimum resistance, and this resistance, when reached, is about 40% higher than that of the treated wooden separators. On the other hand, the treated wooden separators must always be used damp even to give their results.

Upon the resistances introduced by the different kinds of separators depend two important functions of the battery:

(A) The variation of the volts of the same battery with temperature.

(B) The volts obtained with the same battery using different separators during discharge. These two factors may be determined from the data given in the above table and the equations given below.

Let us first determine the variation in the volts of a three-cell battery between 17° C. and -10° C. when different discharges are made. This is given by the following equation:—

$$V_{17^{\circ}\text{C.}} - V_{-10^{\circ}\text{C.}} = An(R_{-10^{\circ}\text{C.}} - R_{17^{\circ}\text{C.}})$$

Where $V_{17^{\circ}\text{C.}}$ = voltage of the battery at 17° C.

$V_{-10^{\circ}\text{C.}}$ = " " " " -10° C.

A = amperes of discharge

n = number of cells in the battery

$R_{-10^{\circ}\text{C.}}$ is the resistance introduced by the given separator at -10° C.

$R_{17^{\circ}\text{C.}}$ is the resistance introduced by the given separator at 17° C.

The data given in the above table for the resistance introduced by the different kinds of separators at 17° C. are taken here to be greater by about 50% at about -10° C.

Increase in the volts on passing from 17° C. to -10° C.

	Discharges.			
	10 amps.	100 amps.	200 amps.	300 amps.
Wilderman separator	0.00187 v.	0.01875 v.	0.0375 v.	0.0562 v.
Ex. treated wooden separator	0.00487 v.	0.04875 v.	0.0975 v.	0.1462 v.
Threaded rubber separator	0.00380 v.	0.0380 v.	0.0760 v.	0.1140 v.
Non-treated wooden separator	0.00765 v.	0.0765 v.	0.1530 v.	0.2295 v.

(b) Next we determine the difference in the volt. obtained with two three-cell batteries of equal capacity at 17° C. using two different kinds of separators after they reached their minimum resistance (say Ex. wooden and Wilderman separators). This is given by the equation.

$$E'' - E' = A.n.(R'' - R')$$

Where E'' = voltage received using the Wilderman separators.

E' = voltage received using the wooden or other separator.

A = amperes of discharge.

n = number of cells in the battery.

R' = resistance introduced by the wooden or other separator.

R'' = resistance introduced by the Wilderman separator.

	Discharges at 17° C.			
	10 amps.	100 amps.	200 amps.	300 amps.
Volts Wilderman are higher than the volts treated wooden separator by	0.00627 v.	0.0627 v.	0.1254 v.	0.1881 v.
Volts Wilderman are higher than the volts threaded rubber separator by	0.00105 v.	0.0105 v.	0.0810 v.	0.1215 v.
Volts Wilderman are higher than the volts non-treated cedar wood separator by	0.01182 v.	0.1182 v.	0.2364 v.	0.3546 v.

The differences in the volts given in this table considerably increase with the fall in temperature.

Further advantages of the Wilderman separators

1. The Wilderman separators are preferably made of ebonite of a special composition. Ebonite, being very suitable for moulding at comparatively low temperatures, is an ideal material for the making of a precision separator of a complicated construction necessary for the creation of an automatic circulation of the solution. This cannot be done in other materials such as wood etc. None of the present separators used have the essential features requisite for an effective circulation, they have neither the requisite speed of percolation, nor the requisite construction for the production of such a circulation, nor yet are they suitable for such a construction. They are provided with frames of non-porous ebonite of such a design and construction so as to keep the electrodes securely apart, allowing at the same time the gases to escape. The porous ebonite diaphragms are placed within the frame, regulating the amount of the solution on each side of the diaphragm as desired.

2. The Wilderman separators are made with non-compressible ebonite frames so devised to sufficiently counteract the bending and buckling of the electrodes both in the vertical and horizontal direction. This maintains the constant conditions for the correct distributions of the acid between the electrodes, thus securing the requisite effective circulation between the electrodes, and considerably prolonging their life. No other separator does this. The wooden separators are easily compressed to a third of their thickness, and when compressed do not return to their original volume; therefore a battery with wooden separators never has constant conditions. Both the wooden separators and the threaded rubber separator are easily bent in any direction by the electrodes, and therefore do not contribute to prolong the life of the electrode. If several prolonged over-charges and discharges with high current

densities be made, it will be found that the electrodes and separators with the Wilderman separators remain straight and the active material of the electrodes still firm, while with the treated wooden separators the electrodes get badly buckled and bent and the separators damaged.

3. An important feature of the Wilderman separators is that they can be stored and used dry, and immediately they are immersed in acid they give very small resistance. On account of this the batteries can be built up dry. When a new battery is required for use all that is necessary is the addition of the acid. The wooden treated separators cannot be used in this way as they always have to be kept damp.

4. The diaphragms of the Wilderman separators, as well as the frames, have the longest life of any separator in existence, being capable of withstanding the action of the acid (and alkali) and the gases evolved in the accumulator. For this reason the resistances remain constant and uniform, and the current densities remain uniform throughout the electrodes. On the contrary, the wooden diaphragms becoming unequally compressed in the battery change their resistances unequally through the surface and cause the electrodes to work with unequal current densities, while the threaded rubber separators cannot stand the action of the acid and gases of the battery for long periods, the rubber covering representing a badly vulcanised soft rubber substance.

5. As explained above, the volts of the battery are higher the stronger the acid used, with the ebonite separators an acid of higher concentration compatible with the electrodes can be used, a greater amount of acid can thus be stored for the reaction, and the volts of the battery kept higher during discharge. This is impossible with the wooden or the threaded rubber separators, which already suffer much when acid of the present strength is used.

6. The Wilderman separator can be made of any size, shape, or form, such as tubes, cylinders, porous vessels or the like, as may be required for other electric batteries. This cannot be done in wood or any other material at present used for diaphragms.

PULP AND PAPER IN CANADA

Pulp and paper mills continue to increase in number in Canada. Announcement has been made of a new mill, with an output of 200 tons paper, to be erected at Cochrane, Ontario, as part of the expansion policy of the Abitibi Pulp and Paper Company, which operates the paper mill at Iroquois Falls, Ontario, with a daily output of 550 tons of newsprint.

Early in the year the erection of a large pulp and paper mill will commence near Deschenes, P.Q., on the Ottawa River, a few miles above the capital city. Those interested are well-known large timber limit proprietors of the Ottawa valley, possessing extensive areas of pulpwood.

The Fort William Paper Co. is considering plans to increase the capacity of the newsprint mill from 150 tons to 400 tons daily, and to increase the sulphite plant capacity. The extensions will cost about \$12,500,000, and be spread over two years.

BIRMINGHAM AND MIDLAND SECTION

Mr. J. C. Mann presided over the meeting held at the University of Birmingham on January 11, when Mr. C. E. Wood, M.Sc., read a paper entitled "A study of the rotatory dispersion of certain derivatives of hydroxy acids."

An historical introduction dealing with the work of Gaye on the rotatory dispersion of the lactates was followed by a description of the author's investigations on normal and isomeric esters of *l*-lactic acid. The prevailing type of dispersion observed in these esters was discussed, together with data regarding the effects of increasing the carbon chain on molecular rotatory power. The effect of branching of the carbon chain was compared both in the positive and negative regions of rotation.

The optical properties of several series of compounds were described with the object of emphasising the differing effects of the alkyl, cyclohexyl, and phenyl groupings when directly attached to the asymmetric centre. A diagram on which were represented the dispersion curves of a typical member of each of these series showed how the positive rotations of the lactates changed progressively through the cyclo-hexahydro-mandelates to the strongly negative rotation of the mandelates.

A comprehensive account of the dispersion of esters containing two centres of optical asymmetry was given, and this included a discussion of the occurrence, causes, and classification of complex and anomalous rotatory dispersion. Experimental results for three esters, *d* sec. butyl *d*-lactate, *d* sec. butyl *l*-lactate and *d* sec. butyl *l*-mandelate, were quoted as being simple cases of compounds containing two centres of optical asymmetry. In the first ester, where the rotations of the two asymmetric complexes are of the same sign, the rotation dispersion remains complex, similar in character to the other isomeric butyl lactates; and in the second ester, where the rotations of asymmetric centres are of opposite sign, anomaly results. In the last ester, however, although there are two complexes of opposite sign and dispersion, no anomaly occurs. It followed, therefore, that one of the factors in the condition for anomaly is that the partial rotations of the two asymmetric centres are of comparable magnitude.

The paper concluded with a brief summary of the

effects of acetylation and benzoylation of the hydroxyl group in diethyl tartrate. Further, by reference to other compounds, it was pointed out that simple derivatives of tartaric acid exhibit all three fundamental types of rotatory dispersion.

CHEMICAL ENGINEERING GROUP

On January 14 the Chemical Engineering Group held a meeting under the chairmanship of Mr. F. H. Rodgers, at Burlington House, at which Mr. J. A. Hall read a paper entitled "Thermo-Electric and Resistance Pyrometry in Industry." This paper continued the subject of temperature measurement begun by Prof. J. W. Hinchley when addressing a joint meeting of the Birmingham Section and the Group at Birmingham last month, and as considerable interest has been aroused it is hoped that further papers will be forthcoming.

The author briefly considered the thermodynamic scale, and then proceeded to discuss the resistance thermometer, mentioning the lack of coincidence with the gas scale and giving the Callender correction. Three methods were discussed of eliminating the resistance of the leads, namely (a) the compensating lead method; (b) the employment of four leads arranged in the form of current and potential leads, to each end of the thermometer bulb; and (c) that used for lower temperatures, in which copper leads are carried right up to the bulb of the thermometer: methods (a) and (c) being of industrial importance. After considering the recording instruments for this type of pyrometer, and pointing out that there is rather a big lag in industrial instruments of this type, owing to the mechanical protection required for the resistance, the author showed diagrams illustrating the apparatus used to determine the sulphur point and discussed the various precautions which had to be taken.

The second portion of the paper dealt with thermocouples. The author expressed a preference for the rare metal couples, although the E.M.F. might be much smaller than could be obtained with base metal couples, since with the former more homogeneous alloys could be obtained, thus eliminating potential sources of error. The base metal couples, too, it was pointed out, whilst more liable to give readings which vary with varying immersions due to non-homogeneity, deteriorated more rapidly, necessitating heavy couples for a long life, but these allow of the reduction of the external resistance, and the larger E.M.F. permits more robust measuring instruments to be employed.

The necessity of periodic calibration of pyrometers was emphasised and diagrams were shown of a method of taking the salt point, and of the variation of E.M.F. with temperature for a number of different substances. The principal features of instruments used in conjunction with these couples were described as well as the methods of protecting the couples. Under this heading it was pointed out that since platinum is readily contaminated by metals at high temperatures it is inadvisable to insert the couple in this case directly into the sheath.

The paper produced an excellent discussion in which the subject was approached from the aspect both of manufacturers and the users. The following gentlemen took part in the discussion: Messrs. Davidson, Dunglison and Foster, Professor J. W. Hinchley and Drs.

Sodean and Watson. In proposing a vote of thanks to the author the chairman complimented English manufacturers on the advances which they had made in the making of accurate instruments of this nature.

MANCHESTER SECTION

Mr. L. Guy Radcliffe, M.Sc.Tech., presided over the meeting held on January 7, when four papers were read and discussed. Some forty persons were present.

A paper entitled "Standardisation in chemical analysis" was read by Prof. W. H. Roberts, of Liverpool. Prof. Roberts said there was much divergence of opinion in regard to standardisation in chemical analysis. He did not, personally, believe in standardisation as a fixed general principle, but only in cases where a particular process was dealing with something indefinite such as the "Reichert-Wollny" process for the determination of butter fat. A process of that description should be absolutely standardised, and everyone should work on the same lines. It was not possible to standardise either the accuracy or the temperament of the workers who were using a process. It was also very difficult to get anybody to carry out a standard process literally as laid down, sooner or later a man would vary the process to suit himself, and even slight differences would create great variations in the final results. Several processes had been more or less standardised, for which standard apparatus had been set up. One in particular was the method of determining the strength of alcoholic liquid by means of the "Sikes" hydrometer, yet there were probably very few "Sikes" hydrometers outside the laboratories of analysts which were accurate.

It was practically impossible to adopt any standard method for any particular substance. For standard processes there must be standard apparatus, and that apparatus must be very carefully and accurately checked, and in most laboratories this was not the case. Standard processes as laid down by text books did not conduce to concordant results on the part of different workers, while if all tests and all analyses were done by standard methods then the thinking part of the chemical profession would very rapidly deteriorate. Many people held that standard methods were necessary for the analysis of foodstuffs. A method had been set up for the estimation of "woody" fibre in foodstuffs, and a certain analyst had prepared a large quantity of a particular foodstuff, samples of which were sent round to various other people in order that the percentage of fibre might be determined by the same process. There were marked variations in the results. As a matter of fact, it was not in the process itself that the differences occurred, but in the sampling and in the preparation of the sample. It was almost impossible to prepare a sample of, say, 14 or 15 lb. which was uniform throughout.

In his opinion it was the duty of every analyst to work out his own processes; to test everything for himself and not to rely implicitly upon anybody's statement in a text book. Discrimination must also be exercised in the matter of tests. Years ago the test for alum in flour, and similar substances, was by the addition of tincture of logwood, when an immediate blue coloration was produced. This was a very nice

test indeed, until someone commenced to use calcium superphosphate in baking powder. It was suddenly discovered that superphosphate of lime also gave the blue coloration under certain conditions, after prosecutions had been instituted under the Food and Drugs Acts with respect to flours which were not adulterated with alum at all. There were far too many traps for the unwary in standard methods of analysis.

The next paper on "Normal amyl benzene and some of its derivatives, Part 2," was by L. G. Radcliffe, M.Sc.Tech., F.I.C., and R. L. F. Robert, M.Sc.Tech., A.I.C. In this paper the authors stated they had repeated, improved, and extended the work described by one of them and N. Simpkin in a previous communication. As before, the starting material was normal butyl alcohol which, using Fittig's reaction and purified benzyl chloride, gave a considerable quantity of normal amyl benzene. The yield of normal amyl benzene had been materially improved by the use of mechanical stirring of the reaction mixture instead of shaking, and the whole process, instead of occupying several days, was complete in 6 or 8 hours. Purified amyl benzene was used to prepare the normal amyl benzene barium sulphonate and from this the potassium salt was prepared by treatment with potassium carbonate. In another method the potassium salt was obtained by adding the potassium carbonate directly to the neutralised sulphonic acid, filtering, and evaporating the filtrate in the usual way. By this modification the time of preparation was considerably shortened and the yields were quantitative. The potassium salt, warmed with phosphorus pentachloride, gave the sulphonic chloride, and from this the sulphonamide was made by treatment with powdered ammonium carbonate, and oxidised by Pinner's method to *p*-sulphamino-benzoic acid melting at 278-280°, thus confirming the *para* structure for the original sulphonic acid. From the normal amyl benzene-*p*-sulphonic acid a *p*-hydroxy compound was made by fusing the potassium amyl benzene sulphonate with excess of caustic potash at 240° C in a special apparatus kindly lent to the authors by Prof. A. Lapworth. The resulting *p*-hydroxy-*n*-amyl benzene yielded a benzoyl compound melting at 52° and a tetra-bromide melting at 93°. The following three alkyl derivatives were made from this amyl-*p*-hydroxybenzene compound by the usual method: *p*-methoxy-*n*-amyl benzene; the ethoxy compound, and the butyl ether.

The estimation of mixtures of the isomeric toluidines was described by Dr. H. H. Evers and Mr. N. Strafford, M.Sc. The authors stated that in all of the many methods advanced for the estimation of *para*-toluidine in samples of *ortho*-toluidine, the influence of the *meta*-isomer—which was invariably present in small amount in technical toluidines—was overlooked. For this reason alone the accuracy of some of the methods was rendered doubtful. All the methods reviewed in the paper were found to be of limited value, whilst it was claimed that the methods proposed by the present authors permitted of an accurate determination of both *meta* and *para* isomers. The estimation of *m*-toluidine depended upon the fact that on titration with standard bromate this isomer absorbed 3 atoms of bromine per molecule, whilst each of the others absorbed only 2

atoms per molecule, hence the proportion of *meta* could readily be calculated. For the determination of *p*-toluidine a thermo-analytical method had been evolved. Since *o*-toluidine remained liquid even at

20° C, a direct setting point method could not conveniently be applied when dealing with samples of low *para* content; the difficulty had been overcome by artificially raising the setting point by the addition of pure *para*-toluidine in known amount. From the elevation of the setting point of the mixture thus prepared over that of the pure *ortho-para* mixture containing the same proportion of *para* as added to the original sample, the *para* content of the latter could readily be calculated from the data given in the paper. In such mixtures replacement of a portion of the *ortho*- by *meta*-toluidine had no effect on the setting point obtained. In other words, the ternary mixture had the same setting point as the binary one of same *para* content, and hence for such mixtures the method was specific for estimation of the *para* isomer.

The fourth paper read (under arrangement with the Chemical Society) dealt with the influence of the sulphur atom on the reactivity of adjacent atoms or groups, and indicated a qualitative comparison of the reactivities of chlorine and hydroxyl in the α , β , γ , and δ positions to a sulphur atom. The authors of the paper were Dr. G. M. Bennett and Mr. A. L. Hock.

A joint meeting with the Manchester Section of the Institution of the Rubber Industry was held on January 13. Mr. C. Paine, the Chairman of the Manchester Section of the Institution of Rubber Industry, presided, and Mr. L. Guy Radcliffe, M.Sc.Tech., F.I.C., Chairman of the Manchester Section of the Society of Chemical Industry, was also present.

A paper entitled "Rubber solvents" was read by Dr. D. F. Twiss.

Dr. Twiss said that there could be no single ideal solvent because many factors were concerned which were often associated with the particular conditions of use. In addition to solvent power for rubber, other features desirable in a solvent were: (1) Chemical stability in itself; towards rubber, oxygen, moisture, and sulphur chloride. This, in a wide sense, also covered any extreme fire risk. (2) A restricted range of distillation; the solvent must neither be too volatile nor too resistant to vaporisation. (3) Odour not extremely unpleasant. (4) Absence of serious physiological effect.

Certain chemical features of solvents were of significance as affecting their use with rubber. Solvents with a tendency to develop acidity were undesirable. Oxidative tendencies were also undesirable as they might induce parallel oxidation in the dissolved rubber. This was one reason for the lapse of turpentine from popularity.

Cold vulcanisation by means of sulphur chloride generally called for a solvent for the latter which must also be a solvent for rubber; it must, however, not be olefinic or ethylenic in character. Also for this purpose benzene (or other coal tar solvents) and petroleum naphtha need to be carefully purified, and should be able to withstand the Admiralty sulphuric acid test.

NOTTINGHAM SECTION

The fourth meeting of the Session was held with the co-operation of the Fuel Section on January 12 at University College, when J. G. King, Ph.D., F.I.C. (Chief Chemist, H.M. Fuel Research Station), gave a lecture on "The production of liquid fuels from coal." Dr. E. B. R. Prideaux presided.

Dr. King said the production of oil from coal is a problem which is receiving considerable attention in both scientific and economic circles at the present time. From the "world" point of view it is becoming increasingly evident that the peak of oil production from natural sources will be reached in a limited number of years. The consumption of crude oil is increasing annually, thus, to take one example:—the number of oil-burning ships which are now being built is more than 50% of the total even in this country, this consumption taking place to the exclusion of coal.

A recent survey has shown that we in this country can look for no natural source of fuel oil. The Scottish shale beds are almost worked out, and the English shale beds, the chief of which stretches from Norfolk to Somerset, are characterised by a high sulphur content which renders the ultimate product of low commercial value. Our natural resources from a home point of view lie therefore almost entirely in coal, and the problem reduces to—What is the best means of converting coal economically into a stable liquid form which will replace petroleum products?

At the moment there are three main methods under serious consideration with the view to solving this problem, but it is by no means certain which of these, if any, will ultimately be commercially successful.

Dr. King then outlined the three main lines of research: (1) Low-temperature carbonisation; (2) the hydrogenation of coal by the Bergius process; (3) the reduction of carbon monoxide for the catalytic production of liquid fuels.

The primary object of low-temperature carbonisation is the production of smokeless fuel, and the secondary object the production of a tar from which liquid fuel oils can be obtained. Many plants and processes have been put forward; but whilst many have achieved at least partial technical success, none, as yet, has proved successful commercially, and if this process has a future it seems likely that its applications will not be restricted to any one type of plant, since all coals are not equally suited to one particular process.

Dr. King then described in detail the work carried out at the Government Fuel Research Station. In the experimental plant it was found that the period of maximum evolution of tar and gas coincide up to 550° C. The results in general indicate that there is a critical point, which will, however, show some variation with the type of coal and the process of carbonisation.

Not only do the yields of tar vary with temperature of carbonisation, but also the constitution of the tar. At temperatures above 550° there is an accelerated increase in the amounts of phenols and unsaturated oils, whilst the saturated oils show a corresponding decrease.

Again, at the lower temperatures of carbonisation, solid paraffins may be isolated from the oils, whereas at temperatures above 600° no solid paraffins can be obtained.

Grude tar is not miscible with petroleum, and the only method by which the tar can be converted into fuel oils is by distillation. The available products being motor spirit, crude fuel oil, tar acids and pitch.

If, instead of burning 50,000,000 tons of household coal per annum, it is converted into smokeless fuel, this quantity of coal would yield 800,000,000 gals. of crude tar, 550,000,000 gals. of tar oils, and 150,000,000 gals. of motor spirit. In 1924 we imported 1,042,000,000 gals. of fuel and burning oils and 422,000,000 gals. of motor spirit; hence, even if the coal used in industry were also carbonised, the process would not supply the demand for motor spirit. The lecturer deplored the fact that we did not follow the continental practice in recovering as much benzol as possible from coal gas.

Dr. King went on to describe the Bergius process for the hydrogenation of coal. This process offers a much larger quantity of liquid product per ton of coal, but the commercial success at present appears more doubtful than that of low-temperature carbonisation. Briefly, the process of hydrogenation of coal consists of the introduction of hydrogen into the coal substance and into the products of decomposition in such a manner that a high proportion forms liquid products of as fully saturated a nature as possible. The conditions necessary are a pressure of about 200 atmos., a temperature of about 450° C, and a high gaseous concentration of hydrogen.

There are several economic factors which operate against the economic success of the Bergius process; thus, for example, the production of hydrogen at a very cheap rate is essential if the process is to be a commercial success. Thus, a ton of dry, ash free coal requires about 35,000 cu. ft. of hydrogen, i.e., 10% of its weight.

Dr. King then briefly surveyed the progress that had been made relative to the catalytic reduction of carbon monoxide. He pointed out that a considerable advance had been made by Fisher and Tropsch in determining a catalyst and conditions under which liquid hydrocarbons with little or no admixture of oxygenated compounds were formed.

The lecture was well illustrated by numerous slides, and a good discussion followed, in which Messrs. Bowen, Wilkinson, Whittaker, Bramley, Prideaux, and others took part.

CALENDAR OF FORTHCOMING EVENTS

- Jan. 22. SOCIETY OF CHEMICAL INDUSTRY AND INSTITUTE OF CHEMISTRY. *Birmingham and Midland Sections*. Chemists' Dinner. The Queen's Hotel, Birmingham, at 7 p.m. The guests will include the President of the Institute of Chemistry, Prof. G. G. Henderson, the President of the Society of Chemical Industry, Mr. F. H. Carr, C.B.E., and the Chairman of the Chemical Employers' Federation, Mr. K. Wilson.
- Jan. 24. INSTITUTE OF CHEMISTRY, *Leeds Area Local Section*. "The training of the fuel chemist," by Prof. J. W. Cobb.

- Jan. 24. BIRKBECK COLLEGE (UNIVERSITY OF LONDON) CHEMICAL SOCIETY, Breems Buildings, Fetter Lane, E.C.4, at 5.45 p.m. The Distinguished Visitor's Address on "Physical chemistry and the phenomena of life," by Prof. F. G. Donnan.
- Jan. 25. MANCHESTER LITERARY AND PHILOSOPHICAL SOCIETY, at 5.30 p.m. "Some recent advances in the physics of the solid state," by Prof. W. L. Bragg.
- Jan. 25. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 4.30 p.m. "The sugar resources of the British Empire," by B. H. Morgan.
- Jan. 25. ROYAL PHOTOGRAPHIC SOCIETY, *Scientific and Technical Group*. 35, Russell Square, W.C.1, at 7 p.m. Exhibition and demonstration of apparatus used in the testing of photographic products etc.
- Jan. 26. GLASGOW UNIVERSITY ALCHEMISTS' CLUB. Meeting at 7.30 p.m. "Electrosynthesis," by Sir James Walker.
- Jan. 26. INSTITUTE OF CHEMISTRY, *Belfast and District Section*. Queen's University, Belfast, at 7.30 p.m. "Hydrogen-ion concentration in plants," by Prof. Small.
- Jan. 26. FARADAY SOCIETY, Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. (1) "Behaviour of the quinhydrone electrode in solutions of neutral copper sulphate," by J. B. O'Sullivan. (2) "The actinic absorption of chlorine gas with respect to the hydrogen chlorine reaction," by W. Taylor. (3) "The residual effect in the actinic absorption of chlorine," by W. Taylor and A. Elliott. (4) "Vapour pressure and heat of dilution of aqueous solutions. Part II," by W. R. Harrison and E. P. Perman. (5) "Electrostatic capacity of aluminium and tantalum anode films," by N. A. de Bruyne and R. W. W. Sanderson. (6) "On the velocity of chemical reaction in the silent electric discharge," by G. A. Elliott, S. S. Joshi, and R. W. Lunt. (7) "The activation of hydrogen in the electric discharge," by G. A. Elliott. (8) "The Soret effect," by C. C. Tanner; and (9) "An improved method of measuring vapour pressure by air bubbling," by H. I. Downes and E. P. Perman.
- Jan. 26. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. (Ordinary Meeting). "British and American practice in hot and cold working of metals," by F. W. Spencer.
- Jan. 26. SOCIETY OF CHEMICAL INDUSTRY, *South Wales Section*. University College, Singleton Park, Swansea, at 7.30 p.m. "Quantitative spectrographic analysis," by Capt. J. R. Green.
- Jan. 28. INSTITUTION OF ENGINEERING INSPECTION, Palace Chambers, Westminster, S.W.1. "The manufacture and uses of arsenical copper," by I. Taverner.
- Jan. 28. MANCHESTER LITERARY AND PHILOSOPHICAL SOCIETY, *Chemical Section*. Meeting at 7 p.m. "The biochemistry of cork formation." Discussion to be opened by Dr. E. Rhodes.
- Jan. 29. WEST OF SCOTLAND IRON AND STEEL INSTITUTE. "Steel commercially considered," by Sir W. Larke.
- Jan. 31. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. (Cantor Lecture III). "Recent progress in optics," by L. C. Martin.

NOTES FROM OXFORD

Specially contributed

Wine without Water

Oxford has been educationally *en fête* during the week past, having received over 300 members of the Science Masters' Association within its ever hospitable weather-beaten walls, which may easily—to judge from appearances near Magdalen bridge—soon be restored beyond all recognition. Fortunately, the University retains not a few of its time-honoured traditions, though it may be doing its best to reduce our sons to one dead level of uniformity—for all now glory, it seems, in looking untidy alike and the mark of the beast called a gentleman is ceasing to be manners, the hat of respectability being cast aside.

To heal themselves, the wandering school physicians underwent a varied course of treatment, beginning with an exceptionally well-delivered address by their President, General Hartley. The meeting was opened not with prayer, but by closing the windows to prevent the entry of "fresh fog" from outside. Members then smoked themselves in solidly. Thus were fulfilled the words of one of the greatest of Oxford graduates:—"There are not now many European gentlemen, even in the highest classes, who have a pure and right love of fresh air. They would put the filth of tobacco even into the fresh breeze of a May morning." The architect member of the Association has a great opportunity before him to build a lecture room in which stink chambers for smokers are duly provided. The Presidential address was a highly technical disquisition upon the Electrolytic Dissociation Hypothesis. All the old early chestnuts were dished up and finally covered with Debye and Hückel sauce with a special Balliol flavour. Very appropriately, the Editor of *Nature* was called upon to move the vote of thanks. He did so with consummate tact, showing his appreciation of the situation by quoting the story of the Bishop on a week-end visit, who came down to breakfast early and found only the young daughter of the house in evidence. Of course, he talked nicely with her, and learnt that she knew the Lord's Prayer and the Commandments. On asking her, however, if she knew the Creed (or was it the Catechism?), the reply came—"Damn it, I'm only seven." He thus hit off not only his own inability, but presumably that also of the major part of the audience to appreciate the issues raised. Water had received no mention, nor was the least reference made to the unfortunate effect salts have upon acids—unfortunate in that they enhance their acidulous character. In Uesania, we know, from recent official confessions, water is at last being noticed. This is only as it should be—in a dry land. There is less call to honour it in the damp valley of the Thames. Oxford, fortunately, still has links with the past. It remains a centre of religious observance, it is possible to drink a quart of ale from a mug in Magdalen—the feat was performed not long since by a chemist—and port is still current in the Colleges. May the University preserve such traditions and long prosper under them. What matters it whether or no those who arrogate to themselves the name of chemist take water seriously or not.

Dry Catalysis

Boys at home for the holidays would chortle in their joy if they knew what penance their science-masters did during the recent Oxford jaunt by attending at lectures. Of those we sampled, that on Catalysis was the most instructive. We got no further in arriving at a definition of this all-embracing term. Even at Oxford, where words are analysed and made up into dictionaries, clear agreement as to the limitations of a word is not considered necessary. The vision, however, will long remain in our eyes of a gentleman speaking in more or less audible tones—usually less—and at the same time executing a slow, measured *pas seul* behind the lecture-table the while imitating the juggler who throws up a set of balls and keeps them revolving, but doing so with a piece of chalk, using this also in occasional darts at the blackboard to make faint scrawls thereon. When witnessing Prof. Hill's demonstrations, later in the week, of the multiplicity of co-ordinated muscular and nervous actions involved in dancing and in the recovery of balance by a cat falling from a window, we thought back with pity upon that lecturer at Oxford. Also, when we listened there at night to the word-perfect manner in which the Public Orator at Marconi House made his announcements, we thought how good for lecturers it would be if the example set by such a masterly speaker could be turned on at intervals, just as a tuning fork is sounded to start singing; if we are to learn languages by wireless, why not lecturing? Some means of catalysing speakers into clearness of diction and coherency of expression is obviously needed. As to the lecture, the argument was of the limited order usual with counsel in the Chancery Courts. Whatever work lay behind the discourse, we heard nothing of it—how it was done, which after all is the main thing, interpretation in these days being "to haste." Still, in proposing the vote of thanks the venerable Leed took shelter behind no early Bishop's apron, but professed himself rapturously satisfied: he is known, however, to be not merely mellifluous, but soft-hearted. As on the previous evening, the desire seemed to be to have nothing to do with vulgar water. In fact, it was a "dry" discourse. "Loving cups," say mugs of ale, would have been more than welcome. Why does not the Association go the whole hog and logically make the lectures into *Kneipes*? The introduction of the degraded form of fire-worship now customary in the Halls of Science is more than a half-way step. At least those who do not take part in the ritual would find the means of purging their throats from its nauseous effects, though eyes and nose would still suffer from the acrid fumes. Now that we have visited Oxford, we no longer have the slightest belief in the possibility of homogeneous interactions—to use the jargon of the tribe—ever taking place within its confines. Everywhere we went, whether in cellardom or leoprine haunts, in all the physical laboratories, we found the most delicate operations being consistently smoked over and thoroughly nucleated as a consequence, we imagine. We were reminded of an afternoon on a sunny lawn in Dundee at the British Association meeting there: how Lord Kelvin chortled when the recently proclaimed transmutation of copper into lithium was made clear to him in terms of cigarette ash. There is no longer any dis-

cipline in our laboratories and most students now systematically narcotise themselves. Nor is this surprising. We happened through Sedberg in a motor-car recently on a Sunday morning, and saw several masters from the school with their wives walking through the streets after church: one, quite a dignitary, in University gown and mortar-board, was smoking a short pipe. With such un-Victorian example before them, boys may well do anything that suits their fancy. Youth is now but a parasite of a pipe. Doubtless this will soon make its appearance in the Bights at the Boat Race if our young men do not grow too tired to work even at play. We are hereby brought back to water and Oxford. It seemed almost providential, after engaging in "dry catalysis" in the morning, that we were able, in the evening, to dilute our port with water to listen to an eloquent wireless discourse by Sir Alexander Houston, whose every word was perfectly enunciated, upon the history of the New River Company and the inestimable boon of clean water which London owed to Sir Hugh Middleton. It is well that the masses can enjoy both water and clear speech by wireless: let us pray that it does not take to smoke.

CORRESPONDENCE

THE TESTING OF DISINFECTANTS

Sir, Mr. Quinton Moore's interesting note on the "Testing of disinfectants by the Rideal-Walker method," in your issue of December 31, would have been better entitled as one on the testing of *some* disinfectants.

I fear he has overlooked the investigations conducted by my late friend, R. C. Woodcock, and myself many years ago, as noted at foot of this letter*. Incidentally, it may be remarked that these investigations proved beyond doubt that this test is only of value for determination of the comparative germicidal values of those prepared from certain coal-tar derivatives (within the conditions of the test).

Disinfectants vary so much in chemical constitution and action that no one test is available for determining their relative values, and they could only be comparatively valued if their properties were dependent upon one and the same chemical entity.

If reliance were left upon the Rideal-Walker method it would be found that such substances as borax, chromic acid, hydrogen dioxide, benzoic acid and hundreds of other well-recognised preservatives, antiseptic and disinfectant preparations would be condemned as practically useless.

Yours faithfully,

C. T. KINGZETT

* "Bacterial testing of certain disinfectants as affected by varying conditions," by C. T. Kingzett and R. C. Woodcock (communicated to the Brit. Pharm. Conf. at Cambridge in 1916; see *That in Journ.*, July 30, 1916), and "The bacterial testing of disinfectants: a practical criticism," by the same authors (*J. Soc. Public Analysts*, May, 1913).

PERSONAL AND OTHER ITEMS

At a board meeting of the United Alkali Company, on January 18, Mr. Holbrook Gaskell (one of the existing directors) was appointed a managing director, and the following gentlemen were appointed additional directors of the company:—Sir Alfred Mond, Sir Harry McGowan, Mr. J. G. Nicholson, and Lieut.-Colonel G. P. Pollitt.

Mr. N. A. Anfilogoff, general manager of the London and Thames Haven Oil Wharves, Ltd., has been appointed a Justice of the Peace for Essex.

The Home Secretary has appointed Dr. J. C. Bridge, one of the medical inspectors of the Factory Department, to the post of Senior Medical Inspector of Factories, which was vacated by the resignation of Sir Thomas Legge.

The progress medal of the Royal Photographic Society has been awarded to Mr. George Eastman, of the Eastman Kodak Company, in recognition of his inventions, researches, publications and other works which have resulted in an important advance in the development of photography.

Mr. Thorp Whitaker, a director of the Bradford Dyers' Association, has retired from his position as managing buyer of the Association, but will remain in a consultative capacity as a director. Mr. Whitaker, who has completed fifty years' service in the dyeing industry, was chemist to Edward Ripley and Son, Ltd., before he became a director of the Association. He received the O.B.E. for his work in assisting the Board of Trade in buying and distributing colours during the war.

Prof. A. W. Porter has resigned from the honorary secretaryship of the Institute of Physics, and Prof. A. O. Rankine has been appointed to succeed him.

University College, London, which is endeavouring to raise £500,000 in celebration of its centenary, is making a special appeal for £100,000 to endow five "City of London" chairs in various subjects, including geology and pharmacology. It is pointed out that "work on the production, standardisation, and properties of new drugs for medical purposes is an essential function of the Chair of Pharmacology. Such work is of vital importance to all firms dealing in drugs. Great Britain is falling behind Germany and the United States in this branch of industry, and consequently British markets are being flooded by drugs which have been tested and proved abroad."

The death is announced of Lord Bearsted (formerly Sir Marcus Samuel), a pioneer in the use of petroleum and the founder of the Shell Company, which rendered great service to the country during the war by supplying, at the shortest notice, a petroleum distillate rich in toluene for the manufacture of T.N.T. Lord Bearsted was a generous public benefactor, and gave £10,000 in 1924 to Sheffield University to encourage research in metallurgy.

We regret to have to announce the death, after a brief illness, of Mr. F. J. Stoakley, who had been chief assistant to the Professor of Chemistry at Cambridge for many years. The passing of such a genial and attractive personality will be regretted by all those who have passed through the School of Chemistry at Cambridge.

The Theory of Strong Electrolytes

The Faraday Society is arranging a general discussion on "The theory of strong electrolytes," to be held at Oxford on April 22-23. On the first day "Ionic mobility" will be discussed, and on the second day "The activity of strong electrolytes." Well-known European and British workers will be present at the discussion.

Institution of Fuel Technology

The registration of the Institution of Fuel Technology as a company limited by guarantee is announced. Its President is Sir Alfred Mond, and the Vice-Presidents include Lord Aberconway, Prof. H. B. Dixon, Sir Robert Hadfield, Sir William R. Smith, Lord Weir, and Mr. D. Milne Watson.

International Rubber Exhibition

The International Exhibition of Rubber and other Tropical Products will be held in the Grand Palais, Champs Elysées, Paris, from January 21 to February 6. Although unofficially organised under the direction of Mr. H. G. Montgomery, a number of governments are taking part in the exhibition, in addition to numerous producing and manufacturing organisations and firms in various countries. Lord Colwyn is President and Sir Wyndham Dunstan Vice-President of the exhibition, which is held under the patronage of M. Gaston Doumergue, President of the Republic.

In connexion with the exhibition a series of conferences is to be held. M. Painlevé is the Hon. President of these conferences, and will open the proceedings on January 24, at 10 a.m. Sir Wyndham Dunstan and Prof. Perrot will preside at the following daily meetings at which numerous papers by experts on the production and use of rubber, new methods for the treatment of rubber latex and its direct employment for manufacture and new uses for rubber, will be read. In the following week mornings will be devoted to cotton, palm oil, and other tropical products. The exhibition will be opened on Friday, January 21, by M. Perrier, the Minister for the Colonies, and the President of the Republic will visit the exhibition on Saturday, January 22, when the Lord Mayor of London is expected to pay a visit.

European Steel Cartel

It is reported from Paris that the Iron and Steel Cartel will be joined by Austria, Czechoslovakia and Hungary. According to the *Excelsior*, negotiations are being carried on with English interests, who ask for a quota of 9½ million tons, the same as that of Germany, whereas the Cartel offers only 8 million tons.

Anglo-French Industrial Conference

It is reported that the recent conference between representatives of the Federation of British Industries and of the corresponding German Federation will probably be followed by a similar conference between the British Federation and representatives of French industry. An invitation has been sent to French business leaders to come to London to discuss subjects of common interest, and if the invitation is accepted the meeting, according to the *Manchester Guardian*, will probably be held in March.

Beet Sugar Industry

During the campaign which is now drawing to a close, the Cantley, Kelham, Ely, and Ipswich beet sugar factories have produced sugar from 550,000 tons of beets grown on 65,000 acres. This is about half the total acreage of sugar beet grown in Great Britain. The Anglo-Dutch group, which operates the above factories, is now contracting with farmers for a new factory at King's Lynn, to be ready in the autumn.

Forest Research in Canada

At a recent meeting of the members of the Canadian Pulp & Paper Association in Montreal, arrangements were agreed upon for the erection of a forest research laboratory, the site of which will be on the McGill University grounds. A special holding company will be formed with power to enter into a contract for a 40-year lease of the land at a nominal rental. The projected building will cost about \$350,000, and be of fireproof construction. Accommodation will be afforded in the basement of the building for the semi-commercial pulp and paper apparatus, appliances and machinery, as well as that for artificial silk manufacture. The first floor will be devoted, almost entirely, to the executive offices of the Canadian Pulp & Paper Association, the Division of Pulp and Paper of the Forest Products Laboratories, and the Department of Industrial and Cellulose Chemistry of McGill University. The upper floors will be occupied by the library and the various research laboratories of these organisations. The cost of the upkeep and maintenance of the building will be borne in equal proportions by the three parties who will share its occupancy—the University, the Forestry Branch of the Canadian Department of Interior, and the Pulp & Paper Association. The erection of the building will commence at an early date, and it is anticipated to be ready for occupancy within a year. The entire cost of construction will be borne by the Canadian Pulp & Paper Association.

Canadian Mining Industries

The Victoria Syndicate, of London, England, a subsidiary of the Mond Nickel Company, has developed a new mine, the Drum Lummon, in the Pend d'Oreille section of Nelson Mining Division, B.C. also a body of zinc ore in the old Hudson Bay Mine on Sheep Creek, B.C. It has also taken 500,000 shares in the Ruth-Hope Mine, at Sandon, B.C., where a large amount of ore is being developed in the Silversmith Vein. The same syndicate has entered into an agreement with the owners of the Sherritt mine in Northern Manitoba, in the vicinity of the Flin Flon Mine, which is under control of Harry P. Whitney and others of New York, for the further development of this mine.

New German Fertiliser

The German Dye Trust announces that it is placing on the market a fertiliser containing nitrogen, phosphoric acid and potash, "combined by a new chemical process," for which special advantages are claimed. According to *The Times*, this announcement is a move in a struggle between the Trust, the four big potash concerns, and a section of the "heavy" industry.

Alcohol in Canada

The annual financial statement of the Canadian Industrial Alcohol Company, Ltd., Montreal, for the year ending September 30, 1926, shows net profits, after depreciation etc., at \$2,109,851 as compared with \$1,359,026. Dividends of \$1,024,000 were declared, leaving a surplus of \$1,085,851, bringing the total profit and loss balance to \$2,717,340.

COMPANY NEWS

IMPERIAL CHEMICAL INDUSTRIES, LTD.

The directors of Imperial Chemical Industries, Ltd., announce that allotment letters have been posted in respect of transfers "in order" received at the registered offices of Brunner, Mond & Co., Ltd., Nobel Industries, Ltd., the United Alkali Company, Ltd., and the British Dyestuffs Corporation, Ltd., up to December 31. Further batches of allotment letters will be posted at approximately weekly intervals.

The acceptances to date of the offer to exchange shares has been entirely satisfactory, shareholders representing over 80% of the ordinary shares in each company having agreed, and the acceptances from the other classes of shareholders being equally satisfactory.

In response to numerous requests from shareholders abroad and others who are prevented from completing the necessary formalities immediately, the directors of Imperial Chemical Industries, Ltd., have decided to keep the offer open for a reasonable time beyond January 15, named in the circulars to the shareholders.

ILFORD, LTD.

The directors have decided to call a meeting of shareholders to authorise an increase of the capital from £500,000 to £640,000 by the creation of 140,000 new ordinary shares of £1 each, ranking for dividend, and in all other respects *pari passu* with the existing ordinary shares. It is further proposed to capitalise £62,000 of the reserve fund, and to distribute as a bonus one new ordinary share of £1 in respect of every five ordinary shares held.

BRITISH SUGAR PROCESSES, LTD.

The rights for the exploitation of the Suchar process of refining sugar have been secured for the United Kingdom, British West Indies, Egypt, China, Japan, Formosa, India, etc. by an English company, "British Suchar Processes, Limited," which has a strong financial backing. The promising results reported by refineries in which the process is installed suggest that it is at last possible to produce a standard refined sugar at the plantation. The process is simple, and is claimed to effect many economies. The cost of refining by this process is said to be well below that of the bone-char process, while the quality of the sugar produced, judging from shipments made from Porto Rico and Louisiana, is equal to the best on the market. Further, a relatively small capital investment is required, and the water and fuel consumption is low. Moreover, it is claimed that the carbon can be simply and completely reactivated after use.

In addition to its use in the raw sugar factory, Suchar is finding an application in the syrup, jam, and confectionery industries, as it enables the manufacturer to produce directly, from raw sugar, syrups which will conform to any specific requirements.

INTERNATIONAL HOLDINGS AND INVESTMENT CO., LTD.

It is announced that the extra interest payable to the 7% participating first mortgage debenture stockholders in respect of their participation in profits for the half-year ended December 31, 1926, is at the rate of £1 5s. 5d. % free of tax (equal to £1 11s. 9d. gross), payable on February 1.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
 Bisulphite of Lime—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salaminoniac.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included. Sod. Chlorate.—2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free. Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton. Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
 Crimason.—1s. 3d.—1s. 7½d. per lb., according to quality.
 Arsenic, Sulphide, Yellow.—2s. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 2d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
Lamp Black.—£35 per ton, barrels free.
Lead Hyposulphite.—9d. per lb.
Lithophone, 30%.—£22 10s. per ton.
Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r.

London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.

Sulphur Chloride.—4d. per lb., carboys extra.

*Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.

Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.

Vermilion, pale or deep.—5s. 3d. per lb.

Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 per ton. Scarce. Grey, £17 5s. per ton. Liquor, 9d. per gal. 32° Tw.

Charcoal.—£8 5s.—£10 per ton and upwards, according to grade and locality. Very scarce and fair demand.

Iron Liquor.—1s. 6d. per gal. 32° Tw.; 1s. 2d. per gal. 24° Tw.

Red Liquor.—10d.—11d. 16° Tw. per gal.

Wood Creosote.—2s. 9d. per gal., unrefined.

Wood Naphtha.—Miscible, 3s. 10d.—4s. per gal., 60% O.P. Solvent, 4s. per gal., 40% O.P. Both scarce and in fair demand.

Wood Tar.—£4—£5 per ton and upwards, according to grade.

Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carboic. Crystals, 6½d. 6½d. per lb. Crude 60's, 1s. 9½d.—2s. per gal.

Acid Cresylic, 99/100.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 1d. per gal. Pale, 95%, 1s. 10d.—2s. per gal. Dark, 1s. 9d.—2s. per gal.

Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.

Benzole.—Crude 65's, 1s. 3½d.—1s. 4½d. per gal., ex works in tank wagons; Standard motor, 1s. 6d.—2s. 4½d. per gal., ex works in tank wagons; Pure, 2s. 2½d.—2s. 5½d. per gal., ex works in tank wagons.

Toluole.—90%, 2s. to 2s. 6d. per gal. Firm. Pure, 2s. 3d.—2s. 8d. per gal.

Xylol.—2s. 3d.—2s. 8d. per gal. Pure, 4s. per gal.

Creosote.—Cresylic 20/24%—10½d. per gal. Standard specification, 6d.—9½d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8d.—9½d. per gal.

Naphtha.—Crude, 10d.—1s. 1d. per gal., according to quality. Solvent 90/160, 2s.—2s. 1d. per gal. Solvent 95/160, about 2s. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.

Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s. per ton.

Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet Flaked, £12 10s.—£13 per ton.

Pitch, medium soft.—117s. 6d.—130s. per ton, f.o.b. according to district. Scarce and more enquiry. Prices nominal.

Pyridine.—90/140.—9s. 6d.—17s. per gal. Nominal. 90/180—7s. 6d. per gal. Heavy.—7s.—10s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—8s. per lb.

Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.

Acid H.—3s. 3d. per lb. 100% basis d/d.

Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.

Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.

Aniline Oil.—9½d. per lb., naked at works.

Aniline Salts.—9½d. per lb., naked at works.

Anthranilic Acid.—6s. per lb. 100%.

Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—4d.—4½d. per lb. Quiet.

m-Cresol 98/100%.—2s. 8½d. per lb. Quiet.

p-Cresol 32/34° C.—2s. 8½d. per lb. Quiet.

Dichloraniline.—2s. 3d. per lb.

Dimethylaniline.—2s. per lb. d/d. Drums extra.

Dinitrobenzene.—9d. per lb., naked at works.

Dinitrochlorobenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

a-Naphthol.—2s. per lb. d/d.

β-Naphthol.—11d.—1s. per lb. d/d.

a-Naphthylamine.—1s. 3d. per lb. d/d.

β-Naphthylamine.—3s. per lb. d/d.

p-Nitraniline.—1s. 9d. per lb. d/d.

m-Nitraniline.—3s. per lb. d/d.

o-Nitraniline.—5s. 9d. per lb.

Nitrobenzene.—7d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb. d/d.

R. Salt.—2s. 4d. per lb. 100% basis d/d.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—9d. per lb., naked at works.

p-Toluidine.—2s. 2d. per lb. ex works, naked.

m-Xylidine Acetate.—2s. 11d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 4d.—2s. 5d. per lb. Firm.

Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity.

Acid, Boric B.P.—Cryst. £40 per ton. Powder £44 per ton. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 3½d. per lb. Less 5%. Weak market.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots. •

Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. 1s. 4d.—1s. 5d. per lb. Firm and good enquiry. Technical 11½d.—1s. per lb. Good enquiry.

Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.

Acid, Tartaric.—1s. 0½d. per lb. Less 5%.

Amidol.—9s. 6d. per lb. d/d.

Acetanilide.—1s. 7d.—1s. 8d. per lb. for quantity.

Amidopyrin.—11s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.

Aspirin.—2s. 4d. per lb. Good demand.

Atropine Sulphate.—11s. per oz. for English make.

Barbitone.—8s. 9d. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth

Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—

10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—

12s. 6d. per lb., all according to quantity. Bismuth

Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb.

Bismuth Subchloride.—11s. 9d. per lb. Bismuth Sub-

gallate.—9s. 9d. per lb.

Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr
paid any station in Great Britain in ton lots.
Bromides.—Ammonium.—2s. 2d.—2s. 4d. per lb. Potas-
sium.—1s. 9d. 2s. per lb. Sodium.—2s.—2s. 3d. per
lb. All spot.
Calcium Lactate.—1s. 4d. —1s. 6d. per lb.
Chloral Hydrate.—3s. 3d.—3s. 6d. per lb., duty paid.
Chloroform. 2s. 3d.—2s. 7½d. per lb., according to quantity.
Creosote Carbonate.—6s. per lb.
Ether meth.—1s. 1d. —1s. 11½d. per lb., according to sp. gr.
and quantity. Ether purif. (Aether B.P. 1914)
2s. 3d.—2s. 4d., according to quantity.
Formaldehyde.—£39 per ton. Ex wharf in barrels.
Gadacol Carbonate.—6s. 6d. 7s. per lb.
Hexamine.—2s. 4d. 2s. 6d. per lb.
Homatropine Hydrobromide.—30s. per oz.
Hydrastine Hydrochlor.—English make offered, 120s. per oz.
Hydrogen Peroxide (12 vols.).—1s. 8d. per gal. f.o.r. makers'
works, naked.
Hydroquinone.—4s. per lb.
Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots.
Potassium 4s. 1d. per lb. Sodium 4s. 4d. per lb.
Iron. Ammon. Citrate B.P.—2s. 1d. —2s. 4d. per lb. Green,
2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d. —2s. 5d. per lb.
Iron Perchloride.—22s. per cwt., 112 lb. lots.
Magnesium Carbonate.—Light Commercial £33 per ton net.
Magnesium Oxide.—Light Commercial £67 10s. per ton, less
2½%; Heavy Commercial £22 per ton, less 2½%;
Heavy Pure 2s. 2s. 3d. per lb., according to quantity.
Menthyl.—A.B.R. recryst., B.P., 18s. 9d. per lb. net.
Synthetic, 10s. 6d.—12s. per lb., according to quantity.
Liquid (95%), 12s. per lb. Detached cryst., 15s.
per lb.
Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb., Levig,
6s. 6s. 1d. per lb.; Corrosive sublimate, lump, 4s. 8d. —
4s. 10d. per lb., Powder, 4s. 2d.—4s. 3d. per lb.;
White precip., lump, 4s. 10d.—5s. per lb., Powder,
4s. 11d.—5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d.
per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide,
5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d.
per lb.; Sulph. nig., 4s. 10d.—4s. 11d. per lb.
Methyl Salicylate.—1s. 9d. per lb.
Methyl Sulphonol.—15s. 6d. per lb.
Metol.—11s. per lb. British make.
Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
Paraldehyde.—1s. 4d. per lb.
Phenacetin.—3s. 9d.—4s. per lb.
Phenazone.—5s. 9d.—6s. per lb.
Phenolphthalein.—6s. —6s. 3d. per lb.
Potass. Bitartrate.—99/100% (Cream of Tartar) 83s. per cwt.,
less 2½% for ton lots. Dearer.
Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
•Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
Potass. Iodide.—16s. 8d.—17s. 5d. per lb. according to
quantity.
Potass. Metabisulphite.—6d. per lb., 1 cwt. kegs included.
F.o.r. London.
Potass. Permanganate.—6½d. per lb. spot.
Quinine Sulphate.—2s. per oz.—1s. 8d. —1s. 9d. per oz. in
100 oz. tins.
Rac. cin.—4s.—4s. 3d. per lb. spot.
Saccharin.—55s. per lb. Quiet.
Salol. 3s.—3s. 3d. per lb.
Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C.,
1923.—2s.—2s. 2d. per lb.; U.S.P., 1s. 11d.—2s. 2d.
per lb., according to quantity.
Sod. Ferrocyanide.—4d. per lb., carr. paid.
Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d.
consignee's station in 1-cwt. kegs.
Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—80s.—85s. per cwt.
net, according to quantity.
Sod. Salicylate.—Powder, 1s. 10d.—1s. 11d. per lb.; Crystal,
1s. 11d.—2s. per lb.
Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton,
according to quantity, 1-cwt. kegs included.
Sulphonol.—10s. 6d. per lb.
Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
Thymol, Puriss.—10s. 9d.—11s. 6d. per lb., according to
quantity. Natural. 17s. 6d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.
Aubepine (*ex Anethole*).—10s. 6d. per lb.
Amyl Acetate. 2s. per lb. Amyl Butyrate.—5s. 6d. per lb.
Amyl Salicylate.—3s. per lb.
Anethole (M.P. 21/22 °C.).—5s. 6d. per lb.
Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s.
per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl
Benzoate. 2s. 3d. per lb.
Cinnamic Aldehyde.—Natural, 17s. per lb.
Coumarin.—11s. per lb.
Citronellol.—15s. per lb.
Citral.—9s. 6d. per lb.
Ethyl Cinnamate.—10s. per lb.
Ethyl Phthalate.—3s. per lb.
Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—19s. per lb.
Geraniol.—6s. 6d. 10s. 6d. per lb. Heliotropine.—
4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—
(*ex Shui Oil*) 12s. per lb.—(*ex Bois de Rose*) 16s. per lb.
Lanilyl Acetate.—(*ex Shui Oil*) 14s. 6d. per lb.—(*ex Bois
de Rose*) 18s. per lb.
Methyl Anthranilate.—9s. per lb.
Methyl Benzoate.—4s. 6d. per lb.
Musk Ketone.—36s. per lb.
Musk Xylol.—8s. 6d. per lb.
Nerolin.—3s. 9d. per lb.
Phenyl Ethyl Acetate.—12s. per lb.
Phenyl Ethyl Alcohol.—11s. per lb.
Rhodinol.—28s. 6d. per lb. Saffrol.—1s. 6d. per lb. Terpineol.
—1s. 6d. per lb. Vamlin.—19s. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.
—31s. 6d. per lb. Bourbon Geranium.—12s. per lb.
Camphor.—63s. 6d. per cwt. Cananga, Java, 20s. per lb.
Cassia, 80/85%.—8s. 6d. per lb. Cinnamon, Leaf. 5½d.
per oz. Citronella.—Java 85/90%, 2s. 4d. per lb., Ceylon,
Pure, 1s. 11d. per lb. Clove, pure—6s. 3d. per lb.
Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc
38/40%, 19s. per lb. Lemon.—9s. per lb. Lemon-
grass.—4s. 6d. per lb. Orange, Sweet.—9s. 9d. per lb.
Otto of Rose.—Bulgarian, 70s. per oz., Anatolian,
30s. per oz. Palma Rosa.—9s. 6d. per lb. Peppermint.—
Wayne County, 24s. 6d. per lb. Japanese, 9s. 6d. per lb.
Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s.
per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at
the Patent Office immediately, and to opposition not later than Mar. 14th.
They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court,
Chancery Lane, London W.C.2, on Jan. 27th. Complete Specifications
marked * are those which are open to public inspection before acceptance.
The remainder are those accepted.

I.—Applications

Ackermann and Langenheim. Conical crushing-mills. 275.
Jan. 5.
Habermann. Centrifugal dryers and separators. 352.
Jan. 5. (Ger., 3.2.26.)
Hatfield. Apparatus for chemical analysis. 214. Jan. 4.

Johnson (I.-G. Farbenind.). Drying gases. 54. Jan. 1.
 Leek. Separation of solids and liquids from suspensions
 etc. 566. Jan. 8.
 Minter. Kilns. 162. Jan. 3.
 O'Neill. Pulveriser. 371. Jan. 6.
 Ver Mehr. Mixing-machines. 357. Jan. 5.

I.—Complete Specifications

23,996 (1925). Slate. Refrigeration. (240,485.)
 591 (1926). Bentley. Rotary kilns and furnaces.
 (263,630.)
 10,850 (1926). Internat. Combustion Engineering Corp.
 Pulverising-mills. (251,295.)
 14,228 (1926). Bentley, Coates, and Riley and Sons, Ltd.
 Colloidal or the like materials. (263,670.)
 18,022 (1926). Chypers. Rotary drying drum. (255,492.)
 18,917 (1926). Brackett and Co., Ltd., and Brackett.
 Screening or filtering apparatus. (263,693.)
 *7418 (1926). Soc. L'Air Liquide. Separation of constituents
 of gaseous mixtures. (263,732.)
 *27,964 (1926). Deutsche Gasglühlicht-Auer-Ges. Cata-
 lysts for gas reactions. (263,758.)
 *31,173 (1926). Albersheim and Konheim. Determining
 the viscosity of fluids. (263,781.)
 *32,223 (1926). Duchemin. See II.
 *32,536 (1926). Excelsior Feuerlöschgeräte A.-G., and
 Treichel. Producing foam. (263,812.)
 *32,556 (1926). Still. See II.
 *32,793 (1926). Pasquiers. Drying. (263,838.)
 *32,947 (1926). I.-G. Farbenind. Recovery of reaction
 products from gases treated with electric arcs. (263,859.)

II.—Applications

Aluminum Co. of America. Caking coke. 448. Jan. 6.
 (U.S., 22,426.)
 Brégaunt. Gas producing apparatus. 495. Jan. 7. (Fr.,
 14,126.)
 Duckham, and Woodhall-Duckham, Ltd. Manufacture of
 coke. 128. Jan. 3.
 Folliet, and Pétrole Synthétique Soc. Anon. Converting
 gas into hydrocarbons of higher carbon content. 70. Jan. 1.
 Gasifier Co. Gasifying liquid fuels. 252. Jan. 4. (U.S.,
 16,926.)
 International Combustion Engineering Corp. Treatment
 of coal. 444. Jan. 6. (U.S., 12,325.)
 Johnson (I.-G. Farbenind.). Production of products from
 coal, tars, etc. 114. Jan. 3. Purification of mixtures of
 oils. 515. Jan. 7.
 McGuinness. Apparatus for heat treatment of shale etc.
 265. Jan. 4.
 Wlassmann. Low-temperature distillation furnace. 435.
 Jan. 6. (Ger., 5,826.)
 Warsop. Treating bitumen. 39. Jan. 1.

II.—Complete Specifications

25,066 (1925). Umpleby. Generation of gaseous fuel.
 (263,561.)
 30,972 (1925). Soc. de Recherches et D'Exploit. Petroli-
 feres. Manufacture of agglomerated adsorbent carbon.
 (244,561.)
 7390 (1926). Shearman. Apparatus for the destructive
 distillation of bones and the like. (263,659.)
 17,089 (1926). Whitehead and Hird. Low-temperature
 carbonisation of coal, lignite, shale, peat, or the like.
 (263,686.)
 17,582 (1926). Szikla and Rozinok. Gasification of fuel.
 (255,857.)
 25,980 (1926). Wolf and Wolf. Dehydration of coal
 sludge. (260,002.)
 *6417 (1926). Litharge Recovery Corp. Separating
 metallic base reaction products from hydrocarbon oils.
 (263,730.)

*31,545 (1926). Urbana Coke Corp. Coking coal.
 (263,785.)
 *32,223 (1926). Duchemin. Gas scrubber. (263,794.)
 *32,325 (1926). Stettiner Chamotte-Fabr. Coking or
 carbonising ovens. (263,801.)
 *32,556 (1926). Still. Gas-fired furnaces, particularly for
 coke and gas-producing furnaces. (263,817.)
 *32,714 (1926). Ammonia. Purifying gas from the distilla-
 tion of coal or coke. (263,830.)
 *32,861 (1926). Hodler, Bosek, and Maschinenfabr.
 Augsburg-Nürnberg. Carbonising-machines. (263,850.)

III. Application

Johnson (I.-G. Farbenind.). 114. See II.

IV.—Applications

British Alizarine Co., Ltd., and Barnard. Manufacture of
 dyestuffs etc. 379. Jan. 6.
 I.-G. Farbenind. Manufacture of dyestuffs of the triaryl-
 methane series. 127. Jan. 3. (Ger., 2,126.)

IV.—Complete Specifications

24,552 (1925). Bentley, and Blyth & Co., Ltd. Manu-
 facture of poly-nitro-amines. (263,552.)
 *32,225 (1926). I.-G. Farbenind. Manufacture of acid
 dyestuffs of the anthraquinone series. (263,795.)
 *32,555 (1926). I.-G. Farbenind. Manufacture of mono-
 azo-dyestuffs capable of being chromed. (263,816.)
 *32,693 (1926). Soc. Chem. Ind. in Basle. Manufacture of
 dyestuffs. (263,826.)
 *32,839 (1926). I.-G. Farbenind. Manufacture of thio-
 morpholines of the anthraquinone series. (263,843.)
 *32,840 (1926). I.-G. Farbenind. Manufacture of alkyl-
 naphthalenes chlorinated in the nucleus. (263,844.)
 *32,841 (1926). I.-G. Farbenind. Manufacture of benzan-
 throne derivatives. (263,845.)
 *32,956 (1926). I.-G. Farbenind. Manufacture of vat-
 dyestuffs of the dibenzanthrone series. (263,861.)
 *127 (1927). I.-G. Farbenind. Manufacture of dyestuffs
 of the triarylmethane series. (263,879.)

V.—Applications

Brandwood and Holt. Production of artificial silk yarns.
 591. Jan. 8.
 Lilienfeld. Manufacture of artificial materials from
 viscose. 331. Jan. 5. (Austria, 5,126.)

V.—Complete Specifications

23,561 (1925). Cross and Engelstad. Manufacture of
 products comprising lignone derivatives. (263,520.)
 6848 (1926). Vereinigte Glanzstoff-Fabr. Production of
 artificial threads from cellulose derivatives. (249,141.)
 16,046 (1926). Bomberg A.-G. See VII.
 *4113 (1926). Pellerin. Cellulose product resembling
 wool. (263,727.)
 *30,224 (1926). British Enka Artificial Silk Co., Ltd.
 Producing acetyl cellulose compounds. (263,771.)
 *32,530 (1926). Brit. Celanese, Ltd. Phosphoric acid
 solutions of cellulose. (263,810.)

VI.—Application

Bloxam (I.-G. Farbenind.). Producing fast dyeings. 330.
 Jan. 5.

VI.—Complete Specification

27,083 (1925). Imray (Soc. Chem. Ind., in Basle). Dyeing
 acetyl-cellulose. (263,579.)

VII.—Applications

Carpmael (I.-G. Farbenind.). 540. See XX.
 Fairweather (Selden Co.). Catalytic oxidation of sulphur
 dioxide. 174. Jan. 4.
 Johnson (I.-G. Farbenind.). Production of anhydrous
 chlorides etc. 514. Jan. 7.
 Lacell, and New Metallurgy, Ltd. Production of chlorides
 from metallic oxides etc. 609. Jan. 8.

Norsk Hydro-Elektrisk Kvaestofakt. Production of granulated nitrate of lime. 223. Jan. 4. (Norway, 14.1.26.)

VII.—Complete Specifications

26,725 (1925). Hill, and Blaydon Manure & Alkali Co. (1877), Ltd. See XVI.

44 (1926). Siegel. Manufacture of sodium fluoride from silico-hydro-fluoric acid. (263,623.)

2420 (1926). Shimadzu. Apparatus for the continuous production of lead oxides in the dry state. (263,644.)

14,272 (1926). Roessler and Hasslacher Chemical Co. Manufacture of alkali monoxides. (253,520.)

15,625 and 15,936 (1926). Suida. Preparation of concentrated acetic acid from pyroligneous acid. (255,043 and 255,047.)

16,046 (1926). Bomberg A.-G. Production of a basic copper sulphate for the manufacture of cellulose solutions. (260,212.)

*31,051 (1926). Möller and Kretz. Preparation of solutions of hydrofluosilicic acid. (263,779.)

*31,052 (1926). Möller and Kretz. Manufacture of readily-soluble salts of hydrofluosilicic acid. (263,780.)

*32,518 (1926). Vohl & Co. Purification of solutions of metal salts. (263,809.)

VIII.—Applications

Ceramic Patent Holdings, Ltd., and Mellor. Glazes for ceramic ware. 227. Jan. 4.

Folliet, and Pétrole Synthétique Soc. Anon. 69. See X. 70. See II.

VIII.—Complete Specifications

32,252 (1925). Sibar Soc. Anon. Verreries de Romont. Production of a sodium aluminium boro-silicate glass. (245,131.)

17,528 (1926). British Thomson-Houston Co., Ltd. Fusing silica. (255,118.)

*29,473 (1926). Quartz & Silice. Manufacture of ceramic ware or materials. (263,765.)

*29,474 (1926). Quartz & Silice. Blowing and moulding articles in silica glass. (263,766.)

*32,847 and 32,848 (1926). Richeroux. Manufacture of raw plate glass. (263,846-7.)

IX.—Application

Warsop. 39. See II.

IX.—Complete Specifications

26,088 (1925). Rice. Porous or cellular cements. (263,571.)

15,292 (1926). Auspitzer. Improving wood. (253,925.)

19,994 (1926). Smidth & Co. Fine grinding of cement. (256,987.)

23,504 (1926). Voisin. Manufacture of spontaneously-pulverised aluminous cements. (259,203.)

*27,948 (1926). Wolman, Peters, and Pfug. Preservation of wood. (263,757.)

*32,239 (1926). Ahlers. Concrete making. (263,797.)

X.—Applications

Aluminium-Ind. A.-G. Manufacture of aluminium. 546. Jan. 7. (Ger., 27.1.26.)

Ashcroft. Treatment of metallurgical slags etc. and recovery of metal products etc. 620. Jan. 8.

Cole. Proofing iron against rust etc. 66. Jan. 1.

Folliet, and Pétrole Synthétique Soc. Anon. Production of refractory coating on metallic surfaces. 69. Jan. 1.

Hones. Manufacture of steel alloys. 339. Jan. 5.

Hornsey. Manufacture of steel. 355-6. Jan. 5.

Kamishima. Alloys. 108-9. Jan. 3.

Krupp Grusonwerk. Working up complex ores etc. 153. Jan. 3. (Ger., 26.1.26.)

Lacell, and New Metallurgy, Ltd. 425. See XI. 609. See VII.

Novelly. Protecting iron against chemical actions etc. 32. Jan. 1.

X.—Complete Specifications

2289 (1926). Baraboshkin, and Trust Uralkupfer. Extraction of precious metals from the slimes of copper refineries. (263,042.)

10,085 (1926). Goldschmidt A.-G. Utilisation of ferro-silicon masses containing valuable metals. (251,268.)

*27,726 (1926). I.-G. Farbenind. Increasing the strength or hardness of magnesium or magnesium alloys. (263,755.)

*32,535 (1926). Kohlswa Fernverks Akt. Manufacture of steel. (263,811.)

*32,942 (1926). Brit. Thomson-Houston Co., Ltd. Refining metals. (263,856.)

*33,070 (1926). A.-G. Brown, Boveri et Cie. Electric smelting furnaces. (263,872.)

XI.—Application

Lacell, and New Metallurgy, Ltd. Electrolytic production of metals. 425. Jan. 6.

XI.—Complete Specifications

*32,181 (1926). British Thomson-Houston Co., Ltd. Electric furnaces. (263,792.)

*32,943 (1926). Brit. Thomson-Houston Co., Ltd. Electric furnaces. (263,857.)

*33,070 (1926). A.-G. Brown, Boveri et Cie. See X.

XII.—Application

Johnson (I.-G. Farbenind.). 515. See II.

XII.—Complete Specification

*12,209 (1926). Bollmann. Apparatus for deodorising fats and oils. (263,738.)

XIII.—Applications

Bedford, Craven, and Yorkshire Dyeware & Chemical Co. Manufacture of cement for linoleum etc. 143. Jan. 3.

Craven, and Yorkshire Dyeware & Chemical Co. Manufacture of solid resin. 67. Jan. 1.

Pahl. Apparatus for production of lacquers etc. 502-3. Jan. 7.

Potts. Paints. 198. Jan. 4.

XIII.—Complete Specifications

13,113 (1926). Scheiber and Nonck. Production of shellac substitutes. (252,715.)

*32,857 (1926). Quittner. Manufacture of elastic and waterproof coatings. (263,849.)

XIV.—Applications

Burrage. Vulcanisation. 242. Jan. 4.

Coles. Production of rubber articles etc. 582. Jan. 8.

Roessler & Hasslacher Chemical Co. Accelerators for the vulcanisation of rubber. 509. Jan. 7. (U.S., 26.11.26.)

XIV.—Complete Specifications

23,232 (1925). Marks (Du Pont de Nemours & Co.). Accelerators for rubber vulcanisation. (263,517.)

*32,957 (1926). Staudinger. Manufacture of hydro-cycloacoutchouc. (263,862.)

XV.—Complete Specification

9370 (1920). Boyet and Gueudre. Manufacture of artificial horn. (250,607.)

XVI.—Complete Specification

26,725 (1925). Hill, and Blaydon Manure & Alkali Co. (1877), Ltd. Treatment of phosphatic materials. (263,576.)

XIX.—Applications

Jennings. Irradiating milk, milk powder, etc. 428. Jan. 6.

Navarre, Rambaud, Fraisse Frères, and Navarre et Fils. Manufacture of preserved fruits. 213. Jan. 4. (Fr., 8.1.26.)

Thomas. Preparing oatmeal for human consumption. 368. Jan. 5.

XIX.—Complete Specification

*28,215 (1926). Staudt. — Sterilising, ageing, and bleaching flour, meal, etc. (263,760.)

XX.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of complex antimony compounds. 540. Jan. 7.

Chem. Fabr. vorm. Schering. Manufacture of hormone from sexual organs. 440. Jan. 6. (Ger., 261,26.) Manufacture of new derivatives of 2-aminopyridine. 441. Jan. 6. (Ger., 271,26.)

• I.-G. Farbenind. Catalytic dehydrogenations. 115. Jan. 3. (Ger., 41,26.)

I.-G. Farbenind., Lutter, and Schrauz. Manufacture of pharmaceutical compounds. 442. Jan. 6.

Johnson (I.-G. Farbenind.). Production of aldehydes from dicarboxylic acids. 513. Jan. 7.

Neville. Medicinal preparations. 116. Jan. 3.

XX.—Complete Specifications

16,915 (1925). Dreyfus. Production of organic compounds. (263,503.)

24,552 (1925). Bentley, and Blyth & Co., Ltd. See IV.

*30,409 (1926). Mannich. Manufacture of alkyl and aralkyl derivatives of cyclo-trimethylene-aryl-pyrazolones. (263,773.)

*32,896 (1926). Grasselli Chemical Co. Aldehyde amine condensation products. (263,853.)

*33,071 (1926). Chem. Fabr. Pott & Co. Condensation products of aromatic sulphonic acids. (263,873.)

*115 (1927). I.-G. Farbenind. Catalytic dehydrogenations. (263,877.)

XXI.—Application

Martinez. Photo-sensitive surfaces. 487—9. Jan. 7.

XXIII.—Application

Mackinnon. Means for neutralising poisonous gases. 232. Jan. 4.

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number: *Australia*: Steam briquette presses (Agent-General for Victoria, Victoria House, Strand, W.C.2); *British India*: Crude oil engines (20); *China*: Plant and machinery for factories (35); *Germany*: Leather (29); *New Zealand*: Milk bottles (B. 3150); *Netherlands*: Iron, steel, tin (31); *Rumania*: Galvanised iron and steel wire and copper pipe fittings (A.X. 4083); *South Africa*: Dextrine, ink, steel, etc. (C. 2159); *United States*: Steel, pig iron (37); Pressure gauges for ammonia gas (B.X. 3149).

Chemicals at the British Industries Fair

Imperial Chemical Industries—the great chemical merger formed by the amalgamation of Brunner, Mond & Company, Ltd., Nobel Industries, Ltd., the United Alkali Company, Ltd., and the British Dyestuffs Corporation, Ltd., under the Chairmanship of Sir Alfred Mond, Bart., M.P.—is to make its first public appearance at the British Industries Fair organised by the Department of Overseas Trade at the White City, from February 21 to March 4. During the past few weeks the staffs of the respective companies have been collaborating in the organisation of the largest individual

exhibit which will be placed in the Chemical Section of the Fair.

The main object of the exhibit is to make an expression of Imperial Chemical Industries' individuality as one group, at the same time showing the interconnexion of the different companies comprising the merger, and pointing out to overseas buyers, the chemical trade in general, and the public at large the advantages derived by the amalgamation of the various interests. The exhibit will be imperial in its significance as showing the wide influence of the company in British commercial affairs. It will be practical in the sense that the man in the street will be able to visualise its numerous activities, and it will be scientific in the sense that the buyer of chemical goods will at once see the intimate relationship which exists between the products made in the factories belonging to the respective component parts of this great organisation.

Thymol

Howards' Pure Thymol Puriss, we understand from the makers, Messrs. Howards & Sons, Ltd., of Ilford, is a very elegant product conforming to all the tests of the British Pharmacopœia. The description Puriss is fully warranted by the tests, which show that Howards' Pure Thymol Puriss is of a higher melting point than that laid down in the British Pharmacopœia, and is therefore of superior quality, although the price is competitive.

PUBLICATIONS RECEIVED

AN INTRODUCTION TO CHEMISTRY. By C. G. Vernon, M.A., B.Sc. Pp. 276. London: G. G. Harrap & Co., Ltd., 1926. Price 4s. 6d.

PHOTOGRAPHIC CHEMICALS AND CHEMISTRY. By J. Southworth and T. L. J. Bentley. Pp. vi+121. London: Sir Isaac Pitman & Sons, Ltd., and Henry Greenwood & Co., Ltd., 1927. Price 3s. 6d.

The Great Adventure of a Perkin Medallist

JOHN E. TEEPLE, of Trona, Cal., has received the Perkin Medal, and has told us why and all about it. He claims to have been a consultant for many years, and his remarks are colloquial and sometimes amusing. He recalled to our mind the saying of a favourite poet, "What youth was in thy years, what wisdom in thy levity?" For it seems to us that he has got the root of the matter in him; he has put his finger on the spot and has told us simply and pleasantly much that we ought to know. He tells us that good team work has converted a profitless enterprise into the largest borax plant in the world, and one of the three or four largest potash plants in the world. He hints, without wearying us with details, at the transformation of a patch of desert into a modern city where the men work and the women spend their time playing cards and talking scandal. He has some sensible ideas about dollars, and we judge that he is concerned in business, not for his health, but for other and mixed motives. He has little interest in applied chemistry that is a failure on account of lack of profits. "It is a part of the chemist's and engineer's job to see that he does not become attached to an enterprise that is doomed to failure regardless of his work." Then he tells us of his experience; it is an adventure; he has decided that, given time, patience and money, particularly money that is patient, it is very probable that a successful business can be built, if a little horse sense is mixed with the other ingredients. How much wisdom and experience is concentrated in those four words, "money that is patient"! They form a text upon which whole pages could be written, but which no one would believe unless he had had experience. Knowledge comes, but wisdom lingers. We enjoyed also his description of the business man contemplating

such an opportunity and going through the chemists he knows who are available for the work; selecting the best, he enquires if the chemist has the ambition, the spirit of adventure, and the technical equipment which are necessary. Unless all these questions can be answered positively the business man had better postpone the matter indefinitely. The worldly hope men set their hearts upon requires such a colleague. We have had correspondence about the need for college men; we have had the pleasure of reading many accounts of the proper training of a chemist. We do not need to discuss these now, but we shall recommend all young chemists who intend to enter the chemical industry to read the sage observations of John E. Teeple, and whether they follow our advice or not we shall read his paper again with the confident expectation that a third reading will please us as much as the first or the second. When we are appointed as professor of chemistry in either of our oldest universities—no other will satisfy us—we shall have engrossed in large black letters with red capitals and neatly framed the legend, "Does this particular chemist candidate before me have the ambition, the spirit of adventure, and the technical equipment which make it probable that he will be a contributor?" Mr. Teeple, on behalf of the community, we thank you.

Chemistry as an Exact Science.

It is very remarkable that chemistry, which plays so important a part in modern industry, in agriculture, in physiology, botany and medicine, should also have so much common ground with physics and mathematics. Those who aspire to a knowledge of chemistry have a great task in front of them; those who merely wish to follow some of the modern developments have frequent occasion to bring out their dusty books and their

musty ideas and polish them until they present that appearance of constant use which they formerly possessed. A grown-up man who is neither a professor of mathematics nor an engineer should be free from the differential and the integral calculus and from the mysteries of solid geometry and spherical trigonometry. Yet it is not so; we print this week an important paper by Professor Lowry on stereochemistry in which, naturally, there is frequent mention of the work of Sir William Pope; it has fallen to our lot to read Professor Andrade's latest edition of the Structure of the Atom, and a few weeks' ago we were invited by a correspondent to engage in the exhilarating pastime of space formulae as restricted by assumption, projection and assurance. Those who are accustomed to think in three dimensions, as we presume are ninety-five per cent. of the younger chemists, can picture to themselves without difficulty the tetrahedral forms which Lowry so airily discusses in connexion with carbon compounds, stannic iodide, silver molybdate and silica. Gadamar's suggestion that the tetrahedral atom can be turned inside out appears quite accessible to such an expert as Lowry, but some of us have to puzzle our brains a good deal to know the hypotheses of Pope and Barlow, the *er facile* Lowry, and the equations of Andrade, they are relieved here and there by subtle remarks of a less serious, even a light-hearted character. That a good training in the elements of crystallography is of value may be demonstrated by a consideration of the positions attained by those who learned and those who taught that subject at Finsbury. But in the application of mathematics to chemical considerations there are limits; Andrade thinks that Loring and Druce have gone beyond the limit in asserting the presence of the X-ray lines of the element No. 93 on one of their plates; we think that Andrade has gone beyond the limit in introducing hyperbolic functions; we will not hear a word against the friendly little sins and tans, which in times of frost and snow will prettily feed out of your hand, but as for $\coth \alpha$, no, no! We have cut this creature dead these many years. Lowry in his paper preserves a far better feeling for the decencies of life, but we have no notion to what lengths he might go in a book of 750 pages, which is Andrade's latest effort. We accept without question Lowry's vindication of the tetrahedral atom which seems to him to be analogous to a theory that a ring of five atoms is by far the most stable. A scoffing critic tells us that these five-atom rings are so stable that in the laboratory they are quite scarce by comparison with the six-atom rings. We confess that we found it easier to understand the rule in Shelley's case than the definition of valency, and our conception of valency is not rendered any clearer by Andrade's statement that "there gradually arose round the valency bonds a semi-mystical philosophy, which as it grew less and less able to respond to the questions put to it for solution, became the more diffuse and dogmatic." This is mild in comparison with what he says about the discussions of Flürscheim, Lapworth, Robinson, Lowry and Ingold, but then how can a man who is friendly with $\cosh \alpha$ and $\coth \alpha$ have any feeling for organic chemistry? Stereochemistry and electronic theories nevertheless remain to be guides and philosophers

to help the student of organic chemistry; there is one serious objection, and only one, to the tetrahedral atom of carbon. We know it from our own experience; with the aid of glue, gum or paste you may neatly stick together many solid figures carefully constructed out of cardboard; to stick together by their corners six or eight or ten cardboard tetrahedra, so as to present a neat and symmetrical appearance, requires so much patience as to strain even that of an editor. We look forward to the time when at the Chemical Industry Club we shall see learned chemists bringing tetrahedra out of their pockets and assiduously arranging them on the billiard table; meanwhile an assembly of seven tetrahedra adorns our mantelpiece, and affords to our frivolous visitors an appearance of erudition which we covet, but have no pretensions to deserve. If we ever succeed in adding to it three more atoms we will write such a stinging reply to Mr. Murgatroyd; about next Easter we think we shall be ready, and if we can find he has made a slip in his geometry somewhere we will point it out; there's not a trace upon our face of diffidence or shyness.

The Exact Science in Industry

That the chemistry required in industry is usually an exact science is illustrated by the paper we publish this week by Messrs. Lukirsky and Kosman, of the Physical Technical Laboratory of Leningrad, by many scores of other papers published in this journal in the past, by the exact experiments which have resulted in the synthetic manufacture of ammonia at Billingham, and by many other processes too numerous to mention. Messrs. Lukirsky and Kosman have made use of Stokes' law in their measurements of the size of particles. We are all perfectly familiar with this law, $v = 2gr^2(\rho - d_0)/9\eta$ nevertheless, it may be noted that v denotes the velocity of a falling small particle, g the acceleration of gravity, r the radius of the particle, ρ its density, d_0 the density of the medium through which it falls, and η the coefficient of viscosity of it. The principle of the apparatus they use is very simple: there are three cylinders filled with the same liquid; one in which the particles are placed communicates with the second at one level and with the third at a different level. So the particles descend in the cylinder; some at one level find their way into the second cylinder and slightly alter its level, others do the same in the third cylinder. Calculation enables the sizes of particles to be calculated and to a certain extent to be graded. The grading of particles and determination of their sizes are of supreme importance in the manufacture and use of pigments, and many devices have been adopted; there are many forms of settling in air, where the large particles settle in one place and the lighter ones in another. The same sort of separation can be arranged in liquid suspensions, and there are many crushing machines which automatically return the larger particles to be re-crushed. Sieves and meshes of every degree are in use in other branches of industry, and there is a great variety of apparatus for the removal of abnormal grains from liquids or fine powders. If the apparatus described by our Russian contributor is as accurate and simple as it appears on a hasty examination, then it should prove to be useful.

EXPANSION OR GROWTH*

By JOHN E. TEEPLE

The award of the Perkin Medal came to me this year as a distinct surprise, for two reasons. First, I am an habitual consultant; and, second, my inventive ability as measured by patents granted is rather small. Former medallists almost without exception can show long lists of patents, sometimes fifty or more. My list ends at number two, both issued many years ago, and neither ever served as the basis of an industry or proved remunerative to myself or anyone else. In defence of the Medal Committee, however, I should say that patents and inventions do often occur in my neighbourhood, and maybe I can claim to be a catalyst or a fertiliser of inventions, but nothing more. Reverting to the first charge of being an habitual consultant, none of my distinguished predecessors in this high honour seems to have practised this mode of life. Most of them were owners of a manufacturing business, or had been long and exclusively in the service of some one large manufacturing corporation, usually occupying high executive position in it. The two or three exceptions in the list were men on University faculties or in Government service.

It is needless to be inpolite to the Perkin Medal Committee by citing other deficiencies of the present medallist, since my true belief is that the work they have particularly mentioned in making this award, the development of an American potash industry, is well worthy to take its place beside those achievements they have honoured in previous years. There is no lack of modesty in this statement, because it refers to the work and not to the medallist. Some of my honoured predecessors could possibly accept this honour as a personal award because the accomplishments had been largely their own. Most of us, and this is particularly true in my case, can only come here and receive the medal as delegates, as representatives of a large body of workers who have all contributed, who have all distinguished themselves by their services to applied chemistry. It is sufficient glory for the present medallist to have participated with the others and to have contributed what he could.

Now, the story of American potash has been told repeatedly, and the history and problems of this particular plant at Trona, California, have been detailed elsewhere.¹ It will be sufficient here to say that when I first saw the plant, in 1919, it looked like a typical "war baby" with no war in sight. Attempts were still being made to operate in a half-hearted way, but production was only about 20 tons potassium chloride per day, of so low grade that it would now be considered unsaleable, and, although prices were still far above pre-war levels, the daily cost of operation was far in excess of income. To-day the same plant (at least, the buildings are the same ones) is capable of producing nearly 400 tons of very high-grade potassium chloride, borax and boric acid per day, and is marketing them at a profit at prices below pre-war levels and in competition with two of those foreign monopolies that are the *bête noire* of Mr. Hoover—a potash monopoly and a borax monopoly.

* Address delivered by the Perkin Medallist at the meeting of the American Section on January 14.

¹ *J. Ind. Eng. Chem.* 13, 249 (1921); 14, 787 (1922); 14, 904 (1922).

When we sent Mr. H. S. Emlaw, the first manager, to the plant, he was in charge essentially of a desert mining camp. To-day his successor, Mr. Frederic Vieweg, presides over our beautiful city of Trona with about 1000 inhabitants, with tennis courts, golf links, a magnificent swimming pool, steam heat, running water and electric lights furnished by the city, and afternoon teas and bridge for the ladies. The first production manager, Mr. Vieweg, found a plant run largely on tradition, a loud voice, and a strong arm. The present incumbent, Mr. Harald de Ropp, runs it theoretically on meters, thermometers, charts and accurate knowledge, and the actuality of this accomplishment is not far in the future. The first head of research and development, Mr. R. W. Mumford, spent much time with little results in finding data and reports covering research work before July, 1919, so we started at the beginning to determine how the chlorides, sulphates, carbonates, bicarbonates, borates, and metaborates of potassium and sodium would behave under all probable conditions and in all possible combinations. This work included, of course, refrigeration and all kinds of evaporation. The next step was for Mr. Mumford and his successor, Mr. William E. Burke, and the latter's assistant, Mr. Francis McDonald, and their cohorts to apply the information to plant practice. This included the design and operation of continuous vacuum coolers, continuous crystallisers, continuous leachers that leach, continuous vacuum crystallisers that sometimes work, continuous elutriators to handle waste salts from the evaporators—over one ton of salt per minute must be washed free from liquor, discharged from the plant, and the liquor returned to the evaporators. It included the entire re-design of the evaporating system, so that nothing is left of the original but some cast-iron shells, the replacing of many filters by a few continuous settlers, the design of double-tube coolers that could be used for a while without clogging. Every minute somewhere in the plant nearly 200,000 gallons of liquors or water pass through pumps, and every piece of apparatus, most of the pumps, and miles of pipe lines must be so designed that they can be emptied almost instantly and washed free from salts. The intention was to have every operation continuous, to bring brine in at one end of the plant and keep it moving forward steadily till the part we wanted was ready for the customer and the rest was out of the plant. This has been nearly realised. It is obvious that most of the apparatus used was designed to fit special conditions, would not be broadly applicable to other plants, and a detailed description of it would not be of general interest.

To-day this is by long odds the largest borax plant in the world, and one of the three or four largest potash plants in the world. It has a capacity of over one ton finished product every four minutes, and nearly 10,000 lbs. of water are evaporated from brine every minute, yet its evaporators are no larger than they were when the capacity was one-tenth as much, and there are fewer of them with less heating surface; the boiler capacity has been increased only 15%, and the refrigerating compressors not at all; the fuel oil bill is about the same as it formerly was, and the pay roll only a little larger. We have here an excellent example of the application of chemistry to industry, but a mere recital of the accomplishments shows that many other things besides

chemistry had to be applied in order to achieve the result. The chemist and the engineer often overlook these obvious necessities. Men must be well housed and fed; our labour turnover at one time was over 500% per year, an entire new pay roll on the average every ten weeks. Now it is normal. Our freight bill is probably 2,500,000 dollars per year; by proper representations and classifications a good traffic man can save possibly 20%, and a half million dollars per year saved this way is just as big as a half million saved by applied chemistry. Some seven or eight million dollars worth of goods must be sold per year, and in the beginning their reputation for quality was none too enviable. However, they were staple commodities, so our need was for a man who knew the technique of selling, and especially one who would make friends and play fair with every customer. When we selected Mr. A. A. Holmes to be Sales Manager I suggested these especial needs to him, but the admonition was quite unnecessary. By nature he plays fair and makes friends.

In an enterprise like this someone must run a railroad and keep the accounting as the Railroad Commission desires; someone must see that everything is properly covered by insurance, and fire mains, plugs, pumps and department are kept in working order; someone must keep a butcher shop and store, and boarding house and iceplant without either going broke or having the whole town about his ears; pay rolls always tend to increase; someone must keep a sharp eye and a pruning knife ready; purchasing agents like to buy in large lots—someone must use discrimination, or hundreds of thousands of dollars will be tied up uselessly in stores. In a continuously-operating plant like this stoppage may mean a direct loss of ten or twenty dollars per minute. A high speed and skilful maintenance department is a necessity, and its value is greatly increased if the accident is prevented before it happens.

You may say that I am only recounting the problems of any large manufacturing industry. This is largely true, but I want to emphasise the fact that all these things are an integral part of the application of chemistry to industry. No one man could or should give personal attention to them all, but someone must have every one of these problems as his definite responsibility, otherwise the chemical and engineering work may be never so good, and still as a sample of applied chemistry it will be a failure on account of lack of profits. The operation will be a success, but the patient dies, and I do not understand that any medals are awarded for such operations. It is a part of the chemist's and engineer's job to see that he does not become attached to an enterprise that is doomed to failure regardless of his work.

The above sketchy description was meant to show something of the situation at Trona in 1919, its present condition, and the mechanism connecting the two. We have indicated some of the difficulties encountered in work of this type, and now let us look for a moment at the extreme simplicity of it. Your consultant looks over the situation in 1919, and finds an abundance of cheap raw material containing staple products which have a ready market; he finds a plant rather expensively making a partial separation of the products; he finds many unknowns, many difficulties, but no really insurmountable obstacles seem to stand in the way of

a cheap production of certain staple products. So he decides that, given time, patience and money, particularly money that is patient, it is very probable that a successful business can be built, if a little horse sense is mixed with the other ingredients. Then, the time and patient money being available, you start picking men here and there who like work and responsibility. You show them your vision of what can be done. Soon there is a nucleus of men who have the vision and who attract other ambitious souls. The only bait needed is the picture of a big pioneer work to be done, the promise that a man can have all the work, responsibility and freedom from bossing and interference that he is capable of taking, and the assurance that the work will be completed. It is an adventure. Then you watch them grow, see them become resourceful, self-reliant, unafraid. One day it becomes an organisation, a living, growing, co-operating entity working toward a common end, disregarding personal discomfort, 115° in the shade, or 24 hrs. a day. It is no longer a place for the weak, the petty, or the deadwood; the man who is not contributing his best feels lost and fades away. When this peak has been reached you go fishing, and let them alone while they finish the job. You see it is really very simple. There are men in plenty who will work their heads off intelligently and accomplish really marvellous things if you will but realise, and make them realise, the dignity and importance of their work, and give them definite responsibility and authority to do it, asking only for final results. Above all, they must be freed from petty nagging, freed from gloom spreaders, and freed from a voice at their elbow constantly dictating just how and when and where each move should be made.

I am far from advocating such an organisation for all types of work or for all types of men. Your standard corporation organisation, after the efficiency expert gets through with it, presents an entirely different picture, a picture that reminds you of an army with all authority vested in the chief button pusher, and all eighteen vice-presidents looking and acting as much alike as colonels in uniform. Now, an army is a wonderful machine for destruction, or even for routine work. As a mechanism for concentrated physical action, requiring neither thought nor initiative, excepting in the supreme command, it is hard to beat. It is even capable of expansion. But where constructive work is to be done, where research and development work are in progress, where initiative, resourcefulness and good judgment are more important than obedience to orders, there your task becomes one of developing the individual rather than disciplining an army. Where something new is to arise that did not exist before, you need growth, not simply expansion, and growth consists in a change in individual cells, while expansion is simply the addition of more men to an existing army, or more bricks to an existing wall. In the army and the ordinary corporation organisation, the importance of the individual is minimised; he is simply a casualty or a unit of a certain type, and there are plenty of machine-made spare parts to replace him. In the growing organisation, the individual must be emphasised; he is usually hand-made or grown on the spot, and there are no exact duplicates. An army need not know where it is going or what is the immediate or remote object

of its movement, but it must have orders or it is lost. Your organisation for development needs few orders, the fewer the better; but it must have the complete vision of the end to be attained, and the map of its present locations, its immediate and remote movements, and the reasons for them. In the plant at Trona every man has opportunity to see the exact production of every material for the day before, while heads of departments and divisions also know costs of production and their department costs as soon as the officers know them. There are no secrets and no mysteries.

The ordinary non-technical executive, or even the technical one who has not come up through a period of research and development, utterly fails to grasp this distinction between the two types of organisation and the two ways of handling men in them. This statement is not made casually, but is the result of a quarter-century experience with many executives in many corporations. This lack of understanding on the part of executives is one of the most vicious causes of stagnation in many industries which should be progressing. They start a department of research and development, and then freeze it into immobility instead of fostering it and seeing that it grows. When a man has been nagged by an executive who doesn't know what he is talking about, that man doesn't return to his task with the clear brain and eager desire necessary for constructive work.

In the development of this American potash industry, then, there has been chemical work of a rather high order; there have been applications of chemistry and engineering to the problems in hand, both ingenious and effective. There has resulted a successful industry that did not exist before. But the thing in which I take most pride is the growth of the men themselves. They came there most of them rather young, with little or no experience in pioneer work, largely unaware of their own powers or possibilities. They developed ability, responsibility, assurance, and a just appreciation of their fellow workers. It becomes their plant, their business, and they are ready to attack any necessary problem connected with it, cheerful, self-reliant and unafraid.

Perhaps a short summary here would be helpful, and we should note first that all these remarks are meant to apply solely to the creation of something new, that did not exist before. We are not discussing matters of standard practice or the mere duplication of something already existing. The potential importance to industry of chemistry and its applications is so obvious that we spend little time discussing it here, but in order for the application to leave the potential state and become actual or kinetic the results of it must be reflected definitely and clearly on the right side of the ledger. Enterprises dependent on chemical progress are continually starting, and just as continually many of them turn out to be failures, reflecting discredit on both chemists and management. The chemist then desiring to do creative work must ask two questions before he starts; first, are the conditions such that I can do this work so far as it relates to my profession and carry it through to a finish? and second, assuming that my professional work is well done, will all the other factors necessary to commercial

success be available, such as sufficient money, knowledge of business and of the business, experience, salesmanship? Unless the chemist can answer both questions positively and rather decidedly, he had better move on before he starts, otherwise he will find himself ultimately out of a job and under blame for failure, or else he will find himself changed from a creative chemist into a mere work horse. On the other hand the business man who contemplates bringing creative work into his organisation would do well to ask a few questions, such as, Why do I want to take this step? Have I the time, patience and money to carry it through to a finish? Is there some man or men in my organisation with the intelligence and the understanding from experience to direct this work and to lead the men engaged in it so that they will grow and produce? And does this particular chemist candidate before me have the ambition, the spirit of adventure, and the technical equipment which make it probable that he will be a contributor? Unless all these questions can be answered positively the business man had better postpone the matter indefinitely.

For over twenty years a succession of chemists has been coming to my office to explain how they had done excellent creative work, but the business failed or the work was discontinued. In many cases I knew their stories were true. During all this time another succession of business men has been coming to explain how they started creative work at one time, but the chemists were impractical and spent money like drunken sailors, and never finished anything to the point where it was making profits. In many cases I knew their stories were true; but what a waste of money, of time, and of good chemists these stories reveal, and what a pity that there are not more chemists who know business and more business men who know chemistry, at least to the extent that they can talk each other's language intelligently.

Fortunately this is only the darker side of the picture, and the country has many progressive organisations where creative men are working productively and in complete co-operation and understanding, as they have been for many years. Aside from any contributions of a professional or business nature which I may have made to the development of an American potash industry, I have dreamed of an organism doing creative work and also producing profits, free from alibis for failure, ready to assume blame and to share praise, made up of men who had largely grown into their work, and not of stars who demanded that their names be in the biggest letters and brightest lights. I have dreamed of an organism where intelligence ranked higher than office, and ability to contribute was respected above either: where the men had a consciousness of the dignity of their work and an appreciation of the same dignity in the other man's work, and where loyalty and a determination to finish work undertaken were stronger incentives than the lure of the pay roll, but where the pay roll also attempted to keep intelligent pace with their work.

This dream, thanks to the co-operation of many, has been more nearly realised during the last seven years' work than I ever happened to see it elsewhere, and that realisation is one of the most important reasons why you are honoring me with this medal to-night.

THE IMPORTANCE OF FUEL RESEARCH IN THE COAL INDUSTRY*

By C. H. LANDER, D.Sc.

The important industrial position of Great Britain had been achieved directly by the aid of her natural coal resources. We were pioneers in the getting of coal, for even so late as 1870 our output still equalled that of all the rest of the world put together; we were pioneers in the treatment of coal, for it was in this country that the great gas industry had its beginning; and we were pioneers in the application of coal to industrial processes, particularly in the iron and steel trades, and the use of steam for power production.

It is thus not surprising to find the coal mining industry itself occupying a very prominent position, employing, as it normally does, more men than any other industry, except agriculture. But of particular significance to the economic stability of the country is the fact that coal alone has accounted for one-tenth of our total income from exports, whilst a cheap and plentiful supply of coal is essential to the prosperity of our iron and steel, shipbuilding and engineering trades.

Abnormal war and post-war conditions, however, have struck repeated and heavy blows at the well-being of the coal industry, and during the last few years, partly owing to a general depression in the world's demand for coal, partly to increased competition from other coal-producing countries, and partly to domestic troubles, it had gradually fallen upon very anxious times, its former prosperity had disappeared, and conditions generally had become very unstable. Such an unsatisfactory state of affairs is bound in varying degree to re-act unfavourably not only upon all other important industries, but upon every one of us individually.

In the past our advantageous natural position in regard to coal and iron deposits has allowed of a profitable return even from coal mined wastefully by crude methods, and industry has flourished in spite of an extravagant and inefficient use of fuel. But in face of present-day competition, the necessity both for winning and utilising our coal with the utmost possible efficiency is of primary importance if we are to hold the industrial field successfully against other nations; and it is obvious that the recovery of the coal industry and the regaining of its former prosperity will be greatly assisted by the steady application of scientific methods, whether to coal production, coal treatment, or coal utilisation. The field to be covered is necessarily a very wide one, and the best results can be achieved only by the co-operation of all concerned.

Of such significance did possible improvements to be effected by the development of further scientific methods in the winning of coal appear to the Royal Commission that they recommended that the British Colliery Owners' Research Association should be expanded and placed on such a footing that it could deal adequately with this problem, and co-operate with other existing organisations in allied problems.

The question of the partial purification of coal prior to its leaving the collieries is also one which may well exercise a considerable influence upon its selling value. The system adopted for getting the coal has a bearing upon its preparation for the market, since in addition to such inherent impurities as are derived from the natural inorganic matter or ash of the original plant-substances from which the coal has been formed, dirt (from the roof or floor) which is mainly associated with the small coal is gathered during the working of the seam. When the coal reaches the surface it is screened and graded, and the larger sizes are partially purified by hand-picking. In some cases it is also washed. Little systematic enquiry, however, has been devoted to the requirements of coal purification, and several organisations, including the Fuel Research Board, have therefore undertaken investigations of this problem which should lead to a marked increase in the value of colliery products; but it must be borne in mind that the economic success of such refinements depends in large measure upon local or special conditions, and that their adoption in some cases may be considered impracticable.

Although coal has played so prominent a part in our national development, our knowledge of its physical and chemical nature is still very incomplete; but it is clearly essential, both to the most economical use of coal at home and to its most advantageous disposal abroad, that full information in regard to the properties of the various coal seams should be available. Without such information it cannot be ensured that the different types of coal should be properly directed to the purposes for which they are best suited or to the markets where they are most likely to give satisfaction, and afford the most remunerative return; nor can the utmost proportion of the coal mined be turned to some useful end.

The important bearing of the nature of a coal upon its successful application to any given purpose is becoming increasingly evident, and the greater the precision with which processes of combustion or processes of coal treatment can be carried out, the greater also will become the precision with which it will be necessary to define the characteristics of different grades or types of coal. Progress in the field of fuel utilisation, and a growing appreciation of the importance of fuel conservation, is already reacting upon methods of purchase. Buyers overseas are becoming more alive to the significance of coal quality, and are showing a growing inclination to purchase coal to specification.

The desirability of organising a survey of the national coal resources was suggested by the Coal Conservation Committee in 1916, in a letter to the Department of Scientific and Industrial Research, which stated that it appeared "to be essential to the most economical use of our coal in this country and to the most advantageous marketing of it abroad that there should be available a collection of reliable data giving the chemical analyses of all our different coals. Further, it seems to be essential that these analyses should be prepared upon a uniform basis so as to be readily comparable." Such a survey was consequently undertaken by the Fuel Research Division, and has already yielded results of the greatest interest.

In the past there have been no standard methods of

* Read at a joint meeting of the Edinburgh and East of Scotland Section with the local Section of the Institute of Chemistry, on January 20, 1927, Mr. W. A. Williams presiding.

analysis, and different investigators have adopted variations in procedure, which have led to variations in results, and have rendered comparisons uncertain or even definitely misleading. The question of dependable methods of sampling is even more difficult than that of analysis, since the size of the original sample must be kept reasonably small if the cost is not to be prohibitive. Faced by these difficulties in the compilation of reliable data for the purposes of the National Survey, the Fuel Research Board, in 1921, appointed a Committee to examine methods for the accurate sampling and analysis of coal.

The recommendations made by the Sampling and Analysis Committee have been adopted by the Fuel Research Board, and, in so far as they are applicable, also by the Committee appointed by the Institution of Civil Engineers on standard forms of test for heat engines and boiler trials. It is hoped also that they will become the standard practice of analysts throughout the country, so that all results will be strictly comparable.

There remains the fundamental problem of the best utilisation of coal in our home industries, and it is the aim of every fuel technologist to ensure such economy in fuel consumption that the coal used in any industrial process, whether in its raw state or after conversion into electricity or coke, gas and tar, shall yield the utmost possible return for the least possible consumption.

I have pointed out on previous occasions the useful service which a comprehensive survey of the power, heat and light requirements of the various industries of the country, and a careful consideration of their probable future developments, would perform in the elucidation of this important problem.

The Coal Commissioners came to the conclusion that such a survey was imperatively required in the national interest, but that since the problems to be dealt with were so diverse and the sciences and practices concerned in a state of such active development, it should be a continuous process undertaken by a body of a permanent character. They, therefore, recommended to fulfil this purpose the appointment of a Standing Conference composed of representatives of the industries concerned, under some such title as the National Fuel and Power Committee.

Although it is acknowledged that in certain industrial processes such as steam raising, the advantages to be derived from a preliminary conversion of the energy of coal into other forms are very doubtful, it is equally well recognised that in many cases the use of coal in its natural state is both wasteful and obnoxious. But even where solid fuel still holds the field, enormous aggregate savings might be effected by the proper application of established scientific principles which in many cases could be effected by recourse to relatively simple methods of fuel control.

Many processes are available whereby coal can be converted more or less completely into gas, coke and oils, in various proportions, or into electrical energy, but their development must naturally be subservient to the commercial possibilities presented. The introduction of methods of pre-treatment by which the economic value of the products may be increased above that of the coal itself, however, or whereby the value of low grade

coals or smalls may be stepped up, would obviously be all to our advantage. At the present time the most important of such processes are included in electricity generation and in the various systems of carbonisation; but recently methods for the liquefaction of coal and for the conversion of water-gas produced from coke into alcohols have come into prominence.

Dr. Bergius, for instance, has shown that, by subjecting coal to high temperatures and pressures in the presence of hydrogen, yields of oil varying from 40 to 70% by weight can be obtained. It appears unlikely that liquid fuels could be produced by this process from black coal at prices approaching those at present ruling for natural oils; but the experimental results attained have already led to a commercial exploitation of the process in Germany, where two full-scale units are now under course of erection.

In these days liquid fuel is an essential commodity, and the prospect of establishing a home source of fuel oil is a very attractive one to this country, where natural oil is practically non-existent. Low-temperature carbonisation, however, is the process which it has been most sought here to develop for this purpose, since it offers a means of so treating coal as to obtain not only oil fuel and motor spirit, though in limited quantities, but also a free burning solid, smokeless fuel, suitable for either domestic or industrial purposes. Considerable progress has been achieved during the last few years towards the technical and commercial solution of this problem, but a safe pronouncement of its economic possibilities must await the results from full-scale installations working under ordinary commercial conditions.

Both in the Maclaurin plant at Glasgow, which is concerned primarily with the production of a smokeless domestic fuel, and the McEwen-Runge plant in the United States, which produces a pulverised coke intended for direct firing under boilers, however, various aspects of the problem are being investigated on a commercial scale, and should make it easier to reckon correctly the probable future of the process.

Both in France and Germany the synthetic production of alcohol has now passed the experimental stage, and commercial plants have been established.

It would be bold at this transition period to venture any definite forecast of probable future developments, but it seems safe to assume that we are rapidly nearing a period when natural oil supplies will be eked out by oils manufactured from coal. By what particular means this end will be achieved remains to be seen, but it must be borne in mind that since our coal deposits range over wide limits of composition, and since the demands for any particular form of energy vary both with locality and period, future methods of fuel treatment are likely to remain very diverse, and present methods will, no doubt, continue to exist side by side with such innovations as may prove to be workable upon a sound commercial basis. It is already evident that future generations will look back upon our methods of fuel utilisation as crude and inefficient, and that, by some means or another, we may confidently anticipate a certain increase in the proportion of usefully applied energy attainable from a given initial fuel consumption, whether for the production of power, heat or light.

RECENT ADVANCES IN STEREOCHEMISTRY*

By PROF. T. M. LOWRY, C.B.E., M.A., D.Sc., F.R.S.

The three principal dates in the history of stereochemistry (which happen to be separated by intervals of 25 years) are 1849, 1874, and 1899.

(i) In 1849, Pasteur¹ separated a levorotatory form of tartaric acid, which was the mirror-image of the ordinary dextrorotatory acid, and thus laid a firm foundation for his theory of molecular dissymmetry.

(ii) In 1874, le Bel² and van't Hoff,³ taking advantage of the rapidly-growing knowledge of molecular structure, sketched the broad outlines of chemistry in space. In particular, they showed that all the compounds in which optical activity had been recognised up to that date owed this property to the presence of one or more asymmetric carbon atoms.

(iii) The third date is 1899, when Pope,⁴ by making a few simple but essential modifications in Pasteur's methods, succeeded in preparing an optically-active compound which owed its rotatory power to an asymmetric atom of nitrogen, instead of to an asymmetric carbon atom, and thus opened the floodgates through which there has poured an endless stream of optically-active compounds, representing at least a score of new types of atomic and molecular dissymmetry.

MOLECULAR DISSYMMETRY

Pasteur's work on tartaric acid was remarkable alike for its experimental skill and for its clear theoretical interpretation. On the theoretical side, he showed that the essential condition for optical activity in solution is the existence of a state of molecular dissymmetry,⁵ analogous with the dissymmetry of crystal-form with which Herschel⁶ had correlated the optical rotatory power of quartz.

This property of dissymmetry consists in the ability of a three-dimensional figure to exist in two geometrically-similar but non-superposable forms, like a right and left hand. These opposite or "enantiomorphous" forms are characterised by the fact that one can be converted into the other by reflexion in a mirror, as anyone will discover immediately who tries to shake hands with himself in a looking-glass. The same property of right- and left-handedness exists in cricketers and in violinists, in spiral staircases and in corkscrews, and can even be recognised in a printed page, which is enantiomorphous with its image in a mirror. It should be distinguished clearly from asymmetry, since this term implies a complete absence of symmetry. Dissymmetry, however, may occur in figures which possess a very high degree of axial symmetry, although it cannot exist in any figure which possesses a plane, a centre, or an alternating axis of symmetry. Thus, a dissymmetric crystal of sodium chlorate has 7 axes of symmetry, a crystal of quartz has 4 axes, and even tartaric acid has 1 axis of symmetry, although all other elements of symmetry are lacking from these figures.

Whilst, however, Pasteur recognised that optical activity in solution must be attributed to some form

of molecular dissymmetry, and even suggested that it might be due to a structure analogous to a spiral screw or an irregular tetrahedron, he could not express his views in any greater detail because organic chemists had as yet no precise knowledge of molecular structure, and had not even arrived at the fundamental conception of the quadrivalency of carbon.

CHEMISTRY IN SPACE

When once the fundamental facts of molecular structure had become known, however, the notion of chemistry in space followed inevitably. It was, therefore, no mere coincidence that the conception of the asymmetric carbon atom, with all that it implies, was put forward simultaneously by two independent workers in France and in Holland. The time for this discovery was indeed already so ripe, if not over-ripe, that both of these workers would have had to yield priority to an Italian chemist if it had not been that one of the three dibromioethanes which Paterno⁷ in 1869 sought to explain by means of a three-dimensional carbon atom turned out to be non-existent. The recent celebration in Amsterdam and in Paris of the jubilee of stereochemistry may therefore be regarded as the commemoration of a period of maturity in chemical theory, as well as of the genius of the two youthful workers who were fortunate enough to gather the ripened fruit from the seed which Pasteur had sown.

STEREOCHEMISTRY OF CRYSTALS

Modern physics has provided abundant confirmation of the validity of the tetrahedral model of the carbon atom, which was foreshadowed by Pasteur and exploited so successfully by le Bel and van't Hoff. In particular the X-ray analysis of the diamond⁸ has revealed a structure in which every essential feature of the tetrahedral model is reproduced, but with the additional advantage that the model can be made to a definite scale, since we can now specify not merely the angle between the bonds, but also their length, which is fixed at 1.5 Å.U. A tetrahedral configuration has also been revealed in the four atoms of iodine which surround the metal in stannic iodide⁹ and the non-metal in carbon tetraiodide,¹⁰ in the four atoms of hydrogen which surround each atom of oxygen in ice,¹¹ and in the four atoms of oxygen which surround the molybdenum in silver molybdate,¹² the sulphur in the mineral sulphates,¹³ and the silicon in quartz and in the other crystalline forms of silica.¹⁴

More important, perhaps, is the fact (revealed by the X-ray analysis of the rhombohedral crystals of the calcite series) that carbon in the carbonates¹⁵ and nitrogen in the nitrates¹⁵ is characterised by a trigonal orientation of three oxygen atoms around the central atom of the anion, since it is clear that van't Hoff's tetrahedral model of the carbon atom now has a rival, and that (as many chemists have more or less vaguely suspected) an atom of carbon can have not one configuration, but two. As a result of this discovery Gadamar's suggestion¹⁶ that the Walden inversion depends on turning the tetrahedral atom inside out,¹⁷ in the process of replacing one radical by another, loses some of its weirdness, since, as I have pointed out,¹⁸ the trigonal configuration provides a "half-way house" in this unexpected transformation.

* From a lecture delivered at the Royal College of Science on Monday, Nov. 29, 1926

X-ray analysis has also revealed a *linear* configuration in the anion of $\text{Cs}[\text{ClClCl}]^{19}$, and of $\text{K}[\text{FHF}]^{20}$. This linear configuration also appears in the bivalent atoms

of hydrogen >O-H-O< in the X-ray model of ice,¹¹

although it is generally agreed that the bivalent oxygen atoms in water probably retain the characteristic angle of $109\frac{1}{2}^\circ$ which they possess when the atom is quadri-

valent, thus : $\text{H}-\text{O}-\text{H}$ not $\text{H}-\text{O}-\text{H}$.

TETRAHEDRON VERSUS CUBE

In view of the transient vogue of the cubic atomic models of Lewis²¹ and Langmuir²² ("eight looser electrons seated on the corners of a dry-goods case"). I should like to direct attention to the evidence in favour of the earlier tetrahedral models afforded by the following list of boiling-points : —

Fluorine	$\text{F}-\text{F}$	— 187°
Oxygen	$\text{O}=\text{O}$	— 183°
Nitrogen	$\text{N}\equiv\text{N}$	— 196°
Carbon	$-\text{C}-\text{C}-$	+ 3917°

When tetrahedral models are used, single, double and triple bonds can be represented by contact of a corner, edge or face of the tetrahedron ; but a quadruple contact of four corners is impossible, except by complete superposition of the two tetrahedra. It is therefore possible, by forming a diatomic molecule, to use up all the valencies of univalent fluorine, bivalent oxygen or trivalent nitrogen ; but in the case of carbon this is impossible. The bonds therefore spread out into a network, which extends until the whole area of a crystal of graphite, or the whole volume of a diamond, is included in a single molecule. When cubic models are used, single and double bonds are represented by edge-contact and by face-contact respectively ; but it is impossible to represent a triple bond except by complete superposition of the two cubes ; the abrupt change of behaviour recorded above should therefore obviously occur on passing from oxygen to nitrogen. In a precisely similar way the abrupt rise of boiling-point on passing from carbon dioxide to silica provides an experimental basis for the contention that non-polar double bonds, which are formed with great readiness by elements of the first short period, are difficult or perhaps impossible to produce in the case of elements of higher atomic number. The crystallographic evidence can indeed be interpreted by supposing that the crystals of carbon dioxide²³ are composed of individual molecules, whilst the various crystalline forms of silica¹⁴ are held together by a network of single bonds, joining quadrivalent silicon to bivalent oxygen, corresponding with the network of single bonds which unites the quadrivalent carbon atoms in the diamond, or the quadrivalent oxygen and bivalent hydrogen in ice.

This vindication of the tetrahedral model of the carbon atom is analogous to the much more familiar argument derived from the well-known strain theory of von Baeyer,²⁴ according to which a five-atom ring is by

far the most stable, in view of the close approximation of its angles to those between the trigonal axes of a tetrahedron.

RESOLUTION OF DISSYMMETRIC COMPOUNDS

If le Bel and van't Hoff gathered the ripened fruits of Pasteur's theory, it is to Pope and his colleagues that we must look for any further development of his masterly experimental methods. Pasteur¹ had used three methods for separating the dextrorotatory and levorotatory tartrates from the racemates, in which they are contained as an optically-inactive 50 : 50 mixture. (i) by picking out the enantiomorphous crystals of sodium ammonium tartrate by means of their oppositely-oriented hemihedral facets, (ii) by finding a mould or ferment which would consume one form of the compound, but die of starvation in presence of the other, and (iii) by combining the racemic substance with a compound in which optical activity is already developed. During the years which followed attempts were made, by applying Pasteur's methods, to extend the range of optical activity beyond the asymmetric carbon-compounds, of which so many examples had already been provided by nature ; but these attempts ended in failure. Indeed, on the experimental side, no new method of any importance was developed during the half century which separated the pioneer work of Pasteur from the equally fruitful pioneer work of Pope. It was therefore no mean achievement when, by using a strong, stable, monobasic, optically-active, sulphonic acid, in a non-ionising solvent, in place of the weak, aqueous, dibasic, carboxylic acid which had been used hitherto for this purpose, Pope⁴ demonstrated for the first time the possibility of resolving an asymmetric base of which the optical activity was due to some other cause than the presence of an asymmetric carbon atom. Moreover, when once the spell of failure had been broken by the application of these new methods, a new spirit of optimistic activity was created, as a result of which the search for optical activity was soon extended to the whole range of multivalent elements, as well as to a large number of carbon-compounds in which molecular dissymmetry could be suspected on the basis of the most diverse theoretical considerations. We can therefore now record the production of optically-active derivatives of not less than 18 elements as follows : N,⁴ S,^{25, 26} Se,²⁷ Sn,²⁸ P,²⁹ Si,³⁰ Cr, Co, Ru, Rh, Ir, Fe, Pt, B,³¹ As,^{32, 33} Be,³⁴ Zn,³⁴ Cu.³⁴ Optically-active derivatives of the first four of these elements, namely, *nitrogen*,⁴ *sulphur*,²⁵ *selenium*,²⁷ and *tin*²⁸ were prepared by Professor Pope and his colleagues in 1899 and the years immediately following, whilst derivatives of the last four elements, namely *arsenic*,³² *beryllium*,³⁴ *zinc*,³⁴ and *copper*,³⁴ have been resolved during the past two years in the Cambridge laboratory by Mills and Raper³² and by Mills and Gotts.³⁴ Reference may also be made to the resolution of a series of centro-asymmetric compounds, the optical activity of which must be attributed to molecular dissymmetry, although it cannot be assigned specifically to any one asymmetric or dissymmetric atom in the molecule. From this enormous mass of material we can only pick out a few salient points for detailed illustration.

(a) *Centro-asymmetry*.—It was pointed out, both by le Bel² and by van't Hoff,³ that if the four hydrogen

atoms of methane are represented as lying at the corners of a regular tetrahedron, the four hydrogen atoms of ethylene $H_2C:CH_2$ must be represented as coplanar. Indeed, le Bel² urged that, if it could be proved that both forms of amylene

were optically inactive, the four radicals *must* be coplanar, since otherwise optical activity would at once become possible in the compound represented by the second formula. In the case of the hydrocarbon allene, however, the hydrogen atoms of the two methylene radicals, which lie on two parallel straight lines in ethylene, again become crossed as a result of the interposition of a third atom of carbon, as shown in the formula $H_2C:C:CH_2$. Optical activity, therefore, once more becomes possible, just as in the case of methane; but, whereas, in order to develop optical activity in derivatives of methane, all the four radicals must be different, it is sufficient in the case of allene that one hydrogen atom of each pair should be replaced by some other radical as in

This prediction, although set out clearly in 1874, has not yet received a direct experimental verification in spite of the efforts of competent workers,³⁵ since no optically-active derivative of allene has been prepared up to the present time. In 1909, however, Perkin, Pope and Wallach³⁶ prepared the optically-active forms of a centro-asymmetric compound, namely, *methyl-cyclohexylidene-acetic acid*:

in which the same conditions were created by using a six-atom ring instead of a double bond. In the following year Mills and Miss Bain³⁷ prepared a somewhat similar compound, the *oxime* of cyclo-hexanone-carboxylic acid

in which the symmetry of the molecule was destroyed by the fact that the three bonds of the nitrogen are not coplanar.

Reference may also be made to the *ketodilactone* of benzophenone-tetracarboxylic acid

which Mills and Nodder³⁸ prepared in optically-active forms in 1921. This compound is of interest in that the central atom of carbon is dissymmetric but not

asymmetric. This condition is achieved by using two identical but unsymmetrical bivalent radicals to occupy the opposite edges of the tetrahedron. In this scheme, therefore, the conditions of dissymmetry in methane are identical with those which exist in allene, since the link between A and B destroys the two planes of symmetry which would otherwise contain AA and bisect BB and conversely.

(To be continued.)

OILS AND PAINTS IN CANADA

The financial statement of the Sherwin-Williams Company, Ltd., of Canada, manufacturer of oils, paints, varnishes, etc., for the fiscal year ended August 31, shows earnings equal to 9.53% on the outstanding common stock of the company, as compared with 8.79% in the preceding twelve months.

SALT IN S. AUSTRALIA

South Australia is the chief producer of salt among the Australian States, the output in 1925 amounting to 78,251 tons, valued at £178,000. The salt is obtained in the dry season from lakes, and only requires to be refined. The reserves in the salt crust in the main salt districts of the State are estimated at over 7,130,000 tons, whilst increasing amounts of solar salt are being produced. It is considered that the industry will expand owing to the increasing use of salt in alkali manufacture.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

ANNUAL GENERAL MEETING, 1927

The Annual General Meeting of the Society of Chemical Industry will be held in the Debating Hall of the University Union, Edinburgh, on Tuesday, July 5, 1927, at 10 a.m.

The following is the preliminary programme of the meetings to be held from July 4 to July 8, inclusive:—

MONDAY, July 4.

- 8—10 p.m. Informal Reception by Chairman and Committee of the Edinburgh and East of Scotland Section, followed by Conversation in the Ballroom of the North British Station Hotel.

TUESDAY, July 5.

9.30 a.m. Meeting of Council in the General Committee Room, University Union.

10 a.m. Debating Hall, University Union—Civic Welcome by The Lord Provost of the City of Edinburgh: Welcome by the Vice-Chancellor of the University of Edinburgh.

Annual Business meeting.
Presentation of the Society's Medal to Lieut.-Col. G. P. Pollitt, D.S.O.

11 a.m. Address by the President—Francis H. Carr, Esq., C.B.E.

1.15 p.m. Luncheon by invitation of the Edinburgh and East of Scotland Section in The North British Station Hotel (The Lord Provost of Edinburgh and the Vice-Chancellors of Edinburgh, St. Andrews, and Aberdeen Universities are expected to be present).

Afternoon—Garden Party.

8.30 p.m.—1 a.m. Reception by the President, and Dance in The Palais de Danse.

WEDNESDAY, JULY 6.

10 a.m. Joint Meeting with the Biochemical Society.

Meeting of Chemical Engineering Group—
Subject: "Paper."

2.15 p.m. Visit to Edinburgh University Chemical Laboratories, King's Buildings.

4 p.m. Reception by the University of Edinburgh in the Upper Library Hall.

7.15 for 7.30 p.m. Annual Dinner of the Society in the North British Station Hotel.

THURSDAY, July 7.

10 a.m. Meeting of Society—papers to be arranged.

Meeting of Fuel Section of the Society—
Subject: "Coal Cleaning."

Afternoon—Meeting of Fuel Section (continued).

Visits to works:—

Messrs. James Brown & Co.'s Paper Mills, Penicuik.

The North British Rubber Works.

(Others may be arranged.)

Evening—Civic Reception.

FRIDAY, July 8.

Excursions:—

(1) Whole day excursion to Melrose, Abbotsford, Dryburgh, and Peebles.

(2) Afternoon excursion to Forth Bridge and Inchcolm.

(3) Conducted tours of Old Edinburgh will be arranged on both Thursday and Friday.

HEADQUARTERS IN EDINBURGH

The office of the Society, during the meetings, will be in The North British Station Hotel.

ACCOMMODATION

Accommodation in Edinburgh during July will be very limited, and members are urged to make early application for the rooms they require. A limited number of rooms are being provisionally reserved in The North British Station Hotel, and members desirous of staying there should, without delay, make their reservations through the **Local Hon. Secretary, Dr. W. T. H. Williamson, 13, George Square, Edinburgh**. Members will be notified, in due course, of other accommodation available.

It is hoped that the world-renowned beauty of Edinburgh and the surrounding country, and their interesting historical associations, together with the social and other attractions of the meetings, will bring a large number of Members and their friends to this Annual Gathering of the Society.

TAR CONFERENCE PAPERS

The Papers that were presented before the Manchester Tar Conference in November last, together with the full discussion, will be published shortly in bound form, at the price of 2s. 6d., post free.

It was felt that the contributions proved so valuable that many of those interested would like to retain, for immediate reference, a complete account of what transpired at the Conference.

A limited number of copies will be available. It is consequently advisable for any who require copies to apply to the General Secretary of the Society of Chemical Industry, Central House, Finsbury Square, London, E.C.2, at once. Orders should be accompanied by the appropriate remittance.

DEATHS

Christie, John (original member), of Levenfield, Alexandria, Scotland, Dyer and Printer. On June 24, 1926.

Cottrell, Allin (elected 1917), Technical Chemistry Department, University of Edinburgh, Lecturer. On August 18, 1926.

Hart, W. Beamont (elected 1897), of 8, Exchange Street, Manchester, Consulting Chemist. On December 30, 1926.

Saulfeld, Adolphe (elected 1895), of Royds Street, Stockport Road, Manchester, Chemical Merchant. On June 5, 1926.

BIRMINGHAM SECTION

There was a large attendance on January 22 at the joint annual dinner, at the Queen's Hotel, Birmingham, of the Birmingham and Midland Sections of the Society of Chemical Industry and the Institute of Chemistry. Mr. J. C. Mann (chairman of the former section) presided.

The toast "The Society of Chemical Industry" was proposed by Mr. K. H. Wilson (chairman, Midland Section, Chemical Employers' Federation), who pointed to the importance of the three organisations named for the efficient administration of the Chemical Industry. All were necessary. It was no use a chemist spending much time on great chemical problems, if they on the selling side could not sell the product, and it would be

equally futile for the manufacturer to find a market for products if the chemist and the workmen had not made it satisfactorily. The Institute was rendering an admirable service as an examining body and in other directions, and the Society of Chemical Industry was performing a most valuable function as a medium for the publication of technical matters, and for providing facilities for discussions.

Mr. F. H. Carr, C.B.E., President of the Society of Chemical Industry, in acknowledging the toast, stated that chemists throughout the country understood, and had helped the world better than before to understand, how important chemistry and the work of chemists was to the life of the community. It was not necessary that chemists should try to convince the public of their importance: the aim was a far deeper one, namely, that there should be proper recognition of the objects to which chemists gave their lives. Many thousands spent their whole lives in furtherance of the chemical industry, and of the application of chemical science to the activities of the working people. They were inspired in their work to a very great extent in the same way as the man of pure science was inspired in his efforts to carry out research. They were anxious to see that the principles which they were applying to their work were applied to the purposes, first, of the country as a whole. They took an interest and pride in the prestige of the industrial community, and consequently an interest in the products, which by their investigations they made possible. They rejoiced to see an ever-increasing closer application of science to industry. The Society of Chemical Industry exercised a profound influence upon them as chemists, and upon their work, because without it they would feel they were working in an individualistic way for rather selfish ends, but by the Society's aid they were able, themselves, to make contribution, and to realise their part in serving the community. By promoting discussions, by giving awards, by encouraging industrial experiments, they were giving their quota for the development of our national trade, concurrently, they developed the corporate spirit. Some five or six years ago they brought out under the auspices of the Society a weekly journal in order to do more on the side of propaganda and to keep chemists better informed of doings in the chemical industry. Unforeseen difficulties occurred, one being the increased cost of printing, which they had not reckoned upon. They spent a good deal of money in carrying out this aim; they never wavered, having complete faith that sooner or later they would succeed. He was glad to state that they had now put an end to losses, and that during the last year they had managed to get a balance on the right side. It was intended further to improve the JOURNAL, and to make it more and more a part in the national life. His experience among those serving on the councils of the various chemical societies was that they were actuated by the one unselfish motive of doing their best in chemistry for the national interest. Recently the League of Nations in planning an Economic Conference sought a report on the world position of the chemical industry for consideration. They, in this country, heard nothing about it, neither did those in France, until it transpired that it had been considered

in Geneva. Apparently the only people who counted in chemical science and industry were the Germans, and they presented a report, which it would appear was intended to cover the whole ground. They spent a considerable time and delivered the report, which came to their hands at the end of last month. It was a careful and able report, but the position was exaggerated by the suggestion that outside some heavy chemicals which could be left to them, all the rest could be perfectly easily provided by Germany. It was urged that the development of the dye industries in various countries would have the effect of depriving the world of cheap articles in that overhead charges would be made unnecessarily high, and that the desirable thing was that such manufacture should be segregated in one or two countries. That information came to the knowledge of the Association of British Chemical Manufacturers, and by the various interests in the chemical industry the whole position had been brought under review. He was able to tell them that a report on the whole matter had been printed and delivered within two or three weeks of the receipt of the report he had referred to, and their report made it perfectly clear to those in Geneva that the position was not quite as one-sided as their German confrères had suggested. He had only mentioned this matter because he wanted to make it clear that action in a corporate way would not have been possible, if they had not had the Society of Chemical Industry and the other professional organisations, and the Chemical Employers' Federation, and the Association of British Chemical Manufacturers.

Prof. Haswell Wilson, in proposing the toast "The Institute of Chemistry," said it seemed to him that chemistry was playing a fundamental part in practically every industry of importance, and that the applications of chemistry were going to be still further extended in industry, and in the not too distant future the efficiency of many concerns might well be gauged by the extent to which output was controlled by professional chemists. Since the most ancient times chemistry had been related in some form or other with the application of medicine, but in the middle of the last century chemistry became practically dominant over medicine. Pasteur was the man who produced that change; he was a chemist, and he had no medical qualification. They could never forget his wonderful work in the domain of bacteriology, and in the treatment of disease. They found to-day that chemistry was dominating medicine in various directions. The Institute of Chemistry, which was responsible for the training and examination of chemists, had high ideals, and had set a standard which had placed chemistry high among the scientific professions.

Prof. G. G. Henderson (President of the Institute of Chemistry), in reply, said it was a pleasure to meet the President of the Society of Chemical Industry, because he felt that in Birmingham, as elsewhere in the country, there was prevalent a desire for unity between every branch of the profession: in other words, for co-operation in every possible way between chemists of every kind. It was a mistake to suppose that the only function of the Institute was to test the applications of those who practised chemistry and enter their names in a register, showing that they were qualified. The principal function

of the Institute was to promote in every possible way the welfare of the great profession of chemistry, and therefore, as he maintained, the welfare of the country. They knew, though it was almost a platitude to say it, there was not a single productive industry in this country which was not ultimately dependent upon the work of the chemist. He believed fervently that the future prosperity of the country would be very largely dependent upon the application to industry of the services of scientific men. He believed, moreover, that industrialists generally had a proper appreciation of the work of the chemist, but unfortunately the great majority of their fellow citizens were supremely ignorant of the importance of chemistry from the national point of view. Therein lay a danger, in his opinion. Unless their industry was prosperous the country must go down. Therefore he believed it was their duty, individually and collectively, and with the aid of their various societies, to educate the general public. If such education were to be successful, they must go outside the region of the scientific journal, which was not read by the man-in-the-street. Almost everybody read the newspaper, and it seemed to him that very valuable propaganda work could be done by utilising the press in the localities in which the chemist lived, by the writing of scientific articles dealing with new developments in chemistry, in popular language. In Glasgow much useful work had been done in that direction. It was not a case of magnifying their profession; it was simply with the idea of changing the attitude of the public mind in relation to men engaged in scientific work.

The toast of "The Guests" was proposed by the Chairman, who warmly acknowledged the work of the hon. local secretaries of the Institute and the Society of Chemical Industry in making the arrangements for that gathering. He cordially agreed with the suggestion that chemists should do all they could to promote the education of the public with regard to the functions of the chemists.

Councillor Hume, replying to the toast, stated that 85% of the products handled by a company with which he was connected was entirely due to the chemist. A few years ago the firm did a good deal of business with Germany, but he was glad to say that to-day they were practically independent of the German chemist. As a member of the Gas Committee, he had found from the records that during the Chamberlain régime nearly all the by-products from the gas works went to Germany. To-day they were taken by Birmingham and Midland industry.

The toast of "The Chairman" concluded a very pleasant evening.

GLASGOW SECTION

A joint meeting with the local section of the Institute of Chemistry was held in the Institute of Engineers and Shipbuilders, Glasgow, on January 21. Mr. S. H. B. Langlands was in the chair, and Mr. J. W. Donaldson, B.Sc., delivered a paper on "The volatility and carbonisation of oils for cylinder lubrication."

The lecturer briefly reviewed the objects of lubrication and pointed out the main features of internal lubrication, contrasting them with those of external lubrication.

The selection of oils for such purposes was a matter of great difficulty, and the usual tests made, such as specific gravity, flash point, and viscosity determinations, were of little help in making a suitable choice.

The nature of the deposits formed within the cylinder depended upon the types of oil and engines used. In some cases a gummy residue resulted, whereas in other cases the carbon deposit formed varied from a fine soot to a hard mass.

An account was given of the investigations which had been conducted with a view to the determination of the behaviour of different lubricating oils under various conditions of temperature, varying periods of time, and in spaces presenting different surface areas. Three oils—light, medium and heavy—were used, and the loss in weight, together with the nature of the residue, ascertained. The results showed that the percentage loss in weight varied with the period of heating and the area of the space in which the oil was heated.

The character of the residue was determined by the temperature. Light-bodied oils did not carbonise till most of the oil had volatilised, and only a small deposit was formed. Heavy oils only vaporised slowly, even at high temperatures, and tended to leave a large deposit.

In the ensuing discussion Dr. Cranston drew attention to the fact that a so-called "heavy" oil had often a low specific gravity, whereas a "light oil" had a high specific gravity.

Dr. Gordon suggested that the origin and chemical constitution of the oils investigated would, in large measure, determine their behaviour under the conditions of the experiment. He also referred to the "blending" of oils, and wondered if this operation was not carried out in an empirical manner.

Mr. Arnot said that the design of the engine had a profound influence upon the results obtained with lubricating oils, and that in a Diesel engine a carbon deposit was not objectionable. A gummy residue, on the other hand, was a very serious trouble. Regarding blending it had to be remembered that the results obtained under working conditions determined the composition of the oil used and not the characters of the individual components.

Mr. Fenton mentioned the results which had been obtained with oils from different sources, and referred to the practice of adding fatty oils to mineral oils for certain types of engine. A low-gravity oil and one which after use had a low viscosity, comparable with its original value, was the most satisfactory lubricant.

On the motion of the chairman, a vote of thanks was accorded to the lecturer, who, in reply, dealt with many of the points raised, and thanked the members for the illuminating discussion.

LIVERPOOL SECTION

The fourth meeting of the Session was held in the Muspratt Lecture Theatre, the University, on January 21. Mr. Alfred Smetham occupying the chair in the absence, through illness, of the Chairman. An application was read from the Prison Education Committee of the Mersey District Adult School Union for offers of lectures to be given at Walton Prison.

A lecture was delivered by Prof. W. C. M. Lewis, M.A., D.Sc., F.R.S., on "Some physico-chemical and biochemical aspects of malignant growths." The work described formed part of the chemical programme undertaken in connexion with Prof. Blair Bell's lead method of cancer treatment, and the Chairman mentioned that financial assistance for the work would be welcomed.

Prof. Lewis first emphasised that the chemical aspect necessarily deals only with a particular phase of the general problem of malignant growth. That the chemical side is, however, of fundamental importance is evident when it is recalled that the pathological, histological and clinical observations are manifestations of modification in structure and metabolism which are themselves a consequence of chemical change.

In systems which are essentially aqueous, purely chemical experience has shown that hydrogen ion and hydroxyl ion are the two most active reagents, and the fact that neither of these rises to any considerable magnitude in biological material, especially living material, shows that many of the chemical changes involved in such systems must depend on the intervention of enzymes. With our present rather rudimentary knowledge of biological enzymes, attempts at correlation along these lines would be premature. We must be content at this stage to follow a simpler plan, namely, to examine only those processes which exhibit the more striking departure from the normal. The fundamental problem for the chemist is to endeavour to disentangle chemical causes from chemical effects.

In connexion with the purely physico-chemical aspect of the subject, reference was made to electrical conductivity and permeability of malignant tissues. Cancerous tissues freshly removed from the body possess in many cases a higher electrical conductivity than normal tissues, though this feature appears to be less general than the increase in electrical capacity. Both phenomena point to an increase in permeability. In agreement with these conclusions, it is known that in actively-growing malignant tissue the calcium content is markedly low, whilst that of potassium is high. It is known from work on emulsification that a calcium compound tends to produce a system in which oil or fat is the continuous phase, i.e., one of low permeability, whilst potassium tends to produce the reverse type in which the aqueous phase is the continuous one, i.e., a system which would possess marked permeability for water-soluble or water-borne materials. The latter system appeared to be a rough analogue of malignant tissue.

Calcium, however, is not the only substance involved in permeability. It was necessary to take into account the phosphatides and cholesterol, substances which were usually found associated together along with other fatty materials. It had been found that lecithin as an emulsifying agent favours the formation of an emulsion in which water is the continuous phase, that is, a system of high permeability. Cholesterol, on the other hand, tends to form the inverse system, so that lecithin and cholesterol exhibit an antagonistic action. In view of its excessive permeability, it would be expected that, in malignant tissue, the ratio of lecithin to cholesterol would be abnormally high. Analyses showed that this is the case.

Further, it is of interest to consider the hydrogen ion concentration, that is, the acidity or alkalinity of the tissue. The blood in malignancy is normal in this respect, probably owing to its powerful buffering action and ease of elimination of excess acid. On the other hand, so far as evidence is available, malignant tissue appears to be slightly acid as compared with normal.

Turning to processes of a more definitely biochemical character, reference was made to the antitryptic activity of the blood in cancer and to glucolysis and lipolysis.

As regards modes of clinical treatment, which are intended to diminish or remove cancerous conditions, it would be anticipated, from the chemical point of view, that one or more of the outstanding biochemical processes, such as those mentioned, should be affected by the drug or treatment employed. At the present time little is known about the chemical mechanism of any of the clinical treatments pursued. As regards the lead method initiated by Blair Bell, all that can be said at present is that the preparation after injection is rapidly converted into lead phosphate in the blood and lodges itself, apparently preferentially in the tumour. It has been found that lead somewhat accelerates glucolysis and retards oxidation.

Dr. Cunningham, who had assisted Prof. Blair Bell in the work, gave some details from the clinical point of view, and answered a number of questions. He stated that out of 270 cases treated, 20% were influenced. In some the disease appeared to have been completely arrested. The lecturer supplemented this statement by mentioning that other methods of treatment had shown much less favourable results. An interesting discussion followed.

CALENDAR OF FORTHCOMING EVENTS

- Jan. 31. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. (*Vantor Lecture III*). "Recent progress in optics," by L. C. Martin.
- Jan. 31. CHEMICAL INDUSTRY CLUB, 2, Whitehall Court, S.W.1, at 8 p.m. "Some scientific aspects of anti-aircraft searchlight work," by Lieut.-Col. C. H. S. Evans.
- Feb. 1. HULL CHEMICAL AND ENGINEERING SOCIETY, Hull Photographic Society's Rooms, Grey Street, Park Street, Hull, at 7.45 p.m. "The application of surface tension to industry," by J. Pryce-Jones.
- Feb. 1. INSTITUTE OF METALS, *Birmingham Local Section* (arranged by the Co-ordinating Committee), Engineers' Club, Waterloo Street, Birmingham, at 7 p.m. "Corrosion," by G. D. Bengough.
- Feb. 1. INSTITUTE OF METALS, *North-East Coast Local Section*, Armstrong College, Newcastle-on-Tyne, at 7.30 p.m. "Methods of measuring temperatures," by C. E. Pearson.
- Feb. 2. SOCIETY OF PUBLIC ANALYSTS, Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. (1) "Arsenic in printing inks," by T. H. Barry. (2) "The immersion refractometer and its value in the analysis of milk," by G. D. Elsdon and J. R. Stubbs. (3) "Irish moss mucilage and a method for its determination," by P. Haas and Barbara Russell-Wells. Informal dinner at St. James's Restaurant, 178, Piccadilly, at 6.30 p.m.

- Feb. 2. **ROYAL SOCIETY OF ARTS**, John Street, Adelphi, W.C.2, at 8 p.m. Ordinary Meeting. "Chemistry and the supply of drugs," by N. Evers. Mr. F. W. Gamble will preside.
- Feb. 2. **INSTITUTE OF BREWING, Burton-on-Trent Section**. "Small economies in breweries," by J. G. Wells.
- Feb. 2. **INSTITUTION OF MINING ENGINEERS**. The 37th Annual General Meeting. House of the Institution of Mechanical Engineers, Storey's Gate, Westminster, S.W.1, at 11 a.m. Dinner in the evening at the Whitehall Rooms, Hotel Metropole (Whitehall Place entrance), at 7 for 7.30 p.m.
- Feb. 3. **UNIVERSITY OF LONDON**. University College, Gower Street, W.C.1, at 5 p.m. "The biological action of light," by Dr. D. T. Harris.
- Feb. 3. **CHEMICAL SOCIETY**, Burlington House, Piccadilly W.1, at 8 p.m. *Ordinary Scientific Meeting*. (1) "The nature of the alternating effects in carbon chains. Part XIV. The directive action of some groups of the form - CERⁿ·CO·R· in aromatic substitution," by J. W. Baker and C. K. Ingold. (2) "The nature of the alternating effect in carbon chains. Part XVII. The directive action of the groups ·CH₂·CH₂·NO₂· ·CH·CH·NO₂ and ·O(NO₂)· in aromatic substitution," by J. W. Baker and I. S. Wilson. (3) "The Storch equation, a general dilution formula and the validity of the law of mass action at limiting dilutions." (4) "The calculation of the equivalent conductivity of aqueous solutions of strong electrolytes at infinite dilution. Part II. Application to data at 0°, 18° and 25°C. Part III. The mobilities of the hydrogen and the hydroxyl ions," by A. Ferguson and I. Vogel.
- Feb. 3. **INSTITUTION OF THE RUBBER INDUSTRY, Birmingham and District Section**, Grand Hotel, Birmingham, at 7 p.m. "India rubber as an auxiliary to suspension," by Dr. F. W. Lancaster.
- Feb. 3. **SOCIETY OF CHEMICAL INDUSTRY, Bristol Section**. Joint meeting with the Chemical Engineering Group and the Fuel Section, at the University, Bristol, at 6.30 p.m. "Production of power from towns' refuse," by J. W. Reber and A. Scott.
- Feb. 4. **SOCIETY OF CHEMICAL INDUSTRY, Manchester Section**. Joint meeting with the Manchester Section of the Oil and Colour Chemists' Association. "Colour," by C. W. Gamble.
- Feb. 7. **INSTITUTION OF THE RUBBER INDUSTRY, London and District Section**, Engineers' Club, Coventry Street, W.1, at 8 p.m. (1) "Set in vulcanised rubber," by H. Turner. (2) "Rubber toys," by H. Standring.
- Feb. 7. **BIOCHEMICAL SOCIETY**, Lister Institute, S.W.1, at 5 p.m.
- Feb. 7. **SOCIETY OF CHEMICAL INDUSTRY, London Section**. Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. "Photographic sensitivity," by Dr. T. Slater Price.
- Feb. 8. **SOCIETY OF CHEMICAL INDUSTRY, South Wales Section**, Technical College, Cathays Park, Cardiff, at 7.30 p.m. "Micro-organisms of the soil," by Prof. J. Mangan.
- Feb. 8. **SOCIETY OF CHEMICAL INDUSTRY, Birmingham and Midland Section**, University Buildings, Edmund Street, Birmingham, at 7.15 p.m. "Metallurgical spectroscopic analysis," by F. Twyman.
- Feb. 11. **CHEMICAL ENGINEERING GROUP**. The meeting arranged for this date has been postponed.

CHEMICAL SOCIETY

Dr. Alexander Scott, F.R.S., Vice-President, occupying the chair at a meeting held on January 20, announced the vacancies about to occur among the Officers and Members of the Council, and reminded Fellows that the Annual General Meeting would be held in London on March 24, at 4 p.m., the Anniversary Dinner being held the same evening at the Hotel Victoria, Northumberland Avenue. The Kamerlingh Onnes Memorial Lecture would be delivered by Professor Ernst Cohen, at the Institution of Mechanical Engineers, on Thursday, February 10, at 8 p.m.

Dr. H. J. Emeléus gave an account of:—

The Glow of Arsenic.

ARSENIC undergoes a slow luminous oxidation at 260—300°. It has been shown that this glow occurs in pure oxygen only on reducing the pressure to a limiting value, which is analogous with the glow of phosphorus. The influence of temperature on the glow pressure was studied. The phenomenon was largely influenced by the dimensions of the apparatus, occurring most readily when conditions favoured diffusion and consequent removal of the oxidation product. In a gas stream arsenic glows at approximately the same temperature in air as in oxygen. Pressure reduction appears to produce the glow by accelerating the diffusion of the oxide.

Dr. N. V. Sidgwick asked why there is a difference for oxygen and air if the rate of evaporation is determined by the total pressure.

Dr. Emeléus said that a glow pressure is observed in oxygen-nitrogen mixtures also, if these are not too poor in oxygen. There was no evidence of differences in the oxidation of arsenic in air and oxygen. Replying to the Chairman, he said that the experiments with gas streams were conducted at atmospheric pressure. No experiments, however, were made with mixtures of arsenious oxide and arsenic, but it would not be expected that such added arsenious oxide would influence the results, since the space over the arsenic was probably saturated with arsenious oxide in any case. No account had yet been taken of the small amount of arsenic oxide also formed.

Mr. R. H. Purcell discussed:—

The Origin of the Spectrum of the Glow of Phosphorus. [With H. J. Emeléus.]

PREVIOUS work on the origin of the ultra-violet band spectrum observed in the light from glowing phosphorus is ambiguous. The spectrum of the phosphorescence of phosphorus pentoxide at the ordinary temperature and when cooled with liquid air was photographed, using a condensed spark for excitation. It gave a continuous spectrum in the visible region, with a maximum intensity in the green. None of the bands characteristic of the glow of phosphorus were observed. Photographs of the discharge through phosphorus pentoxide in a silica tube with external electrodes gave a complex band spectrum, which included all the known bands in the spectrum of the glow of phosphorus. A re-examination of the latter phenomenon has shown further bands common to these two spectra. It is concluded that the spectrum has its

origin in the molecule of an oxide, and not in that of a hydride.

Mr. I. Vogel read the following paper:—

Ring-chain Tautomerism. Part XVI. The effect of two adjacent gem-dimethyl groups on the ease of formation of the cyclopentane ring.

A study of the tautomerism of $\alpha\delta$ -diacetyl- $\beta\gamma\gamma$ -tetramethylbutane (I) has shown that the compound reacts exclusively in the form of the ring isomeride (II) as would be expected from the modified strain theory of Thorpe and Ingold. In addition to purely chemical evidence, confirmation of the structure (II) has been obtained from measurements of the parachor.

Replying to Professor G. T. Morgan, the author said that the characterisation of the isomerides was based on the fact that the *cis*-eliminated water much more readily than the *trans*-modification.

ELECTROPLATERS' AND DEPOSITORS' TECHNICAL SOCIETY

The 11th meeting was held on December 15 last, under the chairmanship of Mr. Macnaughtan, when Mr. A. W. Hothersall, B.Sc., of the Research Department, Woolwich, read a paper on "The acidity of certain electroplating solutions." Mr. Macnaughtan, introducing the speaker, observed that the importance of p_H determination was becoming increasingly apparent, and the benefit of its application to the plating shop was now widely appreciated. There was no doubt that future text-books on electro-deposition would make a practice of stating the precise p_H of each bath described.

Mr. Hothersall preceded his remarks by a detailed explanation of the conception of hydrogen-ion concentration and its relation to the actual strength or concentration of an acid. The plater had always felt the need for some method of estimating p_H , and had roughly satisfied this by attempting to control his bath by using litmus and Congo paper. By this means he had been enabled to keep his nickel solution at a p_H between 4 and 6.4; but with the advance of plating technique and modern requirements a more refined method of determining p_H was necessary. To do this accurately it would be necessary to use the quinhydrone electrode, but for the purposes of the plating shop this expensive apparatus was unnecessary, and sufficiently accurate results could be obtained by indicator methods. The quickest and most simple methods were undoubtedly by means of the Comparator and Capillator, the former of which could be used to obtain p_H values of coloured solutions, *e.g.* nickel solutions. These methods were described in detail, and references also made to the Gillespie drop ratio method and the double wedge Comparator. The author concluded his paper with tables of buffer solutions and indicators with ranges suitable for plating solutions.

During the course of the very interesting discussion which followed, in which Messrs. E. A. Olland, S. Field, W. James, H. Perring and S. Wernick took part, various phases of the applications of p_H to shop practice were discussed, particularly in connexion with the merits of the Comparator method as compared with the quinhydrone electrode. The only fact that militates against the introduction of the latter was undoubtedly its cost, while the disadvantage of the former, in addition to its relative inaccuracy, was the fact that the standards were not permanent and would require renewal at frequent intervals.

The 12th meeting was held on January 19, when Mr. H. Sutton, B.Sc., M.Sc. (Met.), of the Aircraft Station at Farnborough, read a paper on "Electro-deposited coatings for prevention of corrosion." Dr. R. S. Hutton occupied the chair.

Introducing the speaker, Dr. Hutton roughly compared the efficiency of galvanised zinc with electro-zinc. There could be little doubt that present-day galvanising was not as good as it once was, and this fact served to enhance further the merits of electrolytic zinc, remarkably thin coats of which gave adequate protection.

Mr. Sutton prefaced his experiences of the rust-resisting properties of various metals, with a description of the manner in which rusting occurred. The three important factors were, first, the metal; secondly, the mixture deposited as the result of temperature changes; and, thirdly, the oxygen of the air which oxidises the ions entering the solution, thus continually removing the iron from the solution to form insoluble hydroxide.

One of the best metals for preventing rust was zinc. A thickness of 0.0005 inch gave very good protection, thicknesses exceeding this giving no materially increased protection. Cadmium deposits afforded a protection of about the same order as zinc, improved results being obtained by heating to 200–300° C. Nickel was definitely inferior to zinc and cadmium, thick deposits being necessary even for moderate protection. Chromium also gave disappointing results, deposits up to 0.0025 in. being ineffective. Tin and lead, though unsatisfactory preventatives of corrosion, have been useful on parts which are exposed to various chemicals, *e.g.*, explosives.

A very interesting discussion was opened by Mr. S. Wernick, B.Sc., who gave his experience of the comparative protection afforded by zinc obtained from acid and cyanide baths; he stressed the need for a standard corrosion test so as to render results comparable. Mr. W. James stated he had had very satisfactory results with a very thin cadmium plate, whilst deposited chromium when polished gave remarkably good rust protection. Mr. A. E. Olland, A.R.C.Sc., indicated that interference on the part of those responsible for finishing specifications, specifying as they did finishes which were easily removed in subsequent operations, resulted in apparent anomalies in regard to the rust-resisting properties of such metals as zinc.

Mr. C. H. Humphreys, of the Udylyte Process Co. (U.S.A.), gave some interesting details of plating practice in America, where he stated cadmium had largely superseded zinc, a 0.0002-in. plate of cadmium being superior to 0.0005-in. zinc. The different results

obtained by various investigators were largely due to the different types of deposit obtainable from a cadmium cyanide bath. The bath was also very sensitive to the presence of impurities, *e.g.* thallium and lead; it had been found that the presence of as little as 0.001% of the former was sufficient to change the properties of the deposit.

HULL CHEMICAL AND ENGINEERING SOCIETY

At the meeting on January 18, a paper on the "Lodge-Cottrell process of electrical precipitation" was given by Mr. H. W. C. Hendersen, who said that in many works one is faced with the insistent problem of dealing efficiently with finely-divided dust or fume which is carried in suspension by gases from some particular process. For example, in the manufacture of sulphuric acid very great advantages result from thoroughly cleaning the hot burner gases before their entry into the Glover tower; the resulting acid liquor from the tower is perfectly clear, while the trouble caused by the objectionable sludge which otherwise accumulates in the acid plant is avoided. Again, valuable metallic fumes, instead of being lost up the stack, must be recovered from the gases from lead and copper blast-furnaces, tin smelting, etc. In another field, the efficient clearing of combustible gases, *e.g.*, iron blast-furnace gas, producer and illuminating gas, is essential to the satisfactory operation of the process in question.

When gases carrying suspended matter of any kind are subjected to a "corona" electric discharge taking place between two systems of electrodes, one of which is "earthed," while the other is insulated and charged to a high potential, the fine particles coalesce and are precipitated on to the earthed or "collecting" electrodes.

This principle was first tried on an industrial scale at a lead works in 1885, but because at the time the apparatus available was inadequate, the experiment was not successful. To-day, however, practically any fume can be dealt with, and about 300 plants are in successful operation in all parts of the world.

One particular application of the Lodge-Cottrell process which is coming to the fore is the collection of tar fog from the gases from producers, coke-ovens and distillation processes. Fractional precipitation can be successfully employed in such instances, and tar free from water and of good commercial value is obtained without difficulty.

No preliminary gas cooling is required in connexion with the electrical method, and there is no back-pressure caused by the installation to hinder the smooth operation of the furnaces or other process involved. The maintenance costs and power consumption of even large precipitation plants are very small.

An electrical precipitator has been installed for the removal of powdered fuel ash from the boiler gases at a large power house, the output of which is 200,000 kw. This plant handles continuously a gas volume of approximately 1.5 million cub. ft. per minute, and removes 95 per cent. of the ash dust delivered to it.

CORRESPONDENCE

THE JOURNAL

Sir,—To the plea of A. Pinkerton in your issue of December 24, may I add mine for the use in the supplement, *British Chemical Abstracts—B*, of paper equally as thin (and, if possible, of as good a colour) as that employed for the *JOURNAL*. The combined bound volume is not only a formidable weight, but of an appalling size for already over-crowded shelves. Any reduction in weight and thickness would be a boon.

I am, Sir, etc.,

"OVER-CROWDED"

PERSONAL AND OTHER ITEMS

Sir Charles Greenway, chairman of the Anglo-Persian Oil Co., Ltd., on whom a barony was conferred in the New Year Honours List, has chosen the title of Lord Greenway, of Stanbridge Earls.

Col. Sir Edward Brotherton, Bart., the founder of the well-known Leeds firm of Brotherton & Co., Ltd., ammonia and tar distillers, is gazetted as a Deputy Lieutenant of the West Riding of Yorkshire and of the City and County of York. Sir Edward Brotherton is distinguished both as a civic benefactor and as an industrial leader, and this new honour will be appreciated by the industry which he represents.

The Minister of Transport announces that Sir Andrew Duncan has accepted the position of chairman of the Central Electricity Board, constituted under the Electricity (Supply) Act, 1926. Sir Andrew Duncan was Coal Controller in 1919-1920, and on the formation of the Mines Department, he became chairman of the Advisory Committee of the Department.

On January 22, the Lord Mayor and Sheriffs of the City of London visited the International Rubber Exhibition at Paris.

Dr. H. Levinstein has joined the board of the newly-formed Non-Inflammable Film Manufacturing Company, of which Sir Herbert E. Blain is chairman.

Lieut.-Col. J. T. C. Moore-Brabazon, M.P., has resigned his office as Permanent Secretary to the Ministry of Transport to become Chairman of Sensible Heat Distillation, Ltd., the company which controls the "L. & N." process of coal distillation.

The following have passed the January Examination, 1927, for the Associateship in General Chemistry of the Institute of Chemistry:—A. G. Avent, E. H. Bunce, F. W. Clulow, L. Cocker, J. R. Hunecke, E. Myer, and A. E. Taylor.

The Council of the Institution of Electrical Engineers has made the sixth award of the Faraday Medal to Prof. Elihu Thomson, of Boston, U.S.A., Honorary Member of the Institution, who is well known as one of the pioneers in the development of electrical engineering.

The annual luncheon of the British Sugar Beet Society will be held on Thursday, February 17, at the Hotel Victoria, Northumberland Avenue, W.C. Any who wish to be present should apply to the secretary, 6, Lancaster Place, Strand, W.C.

We regret to announce the death, at the age of 49, of Mr. John Webster, the Home Office analyst. Mr. Webster, who was educated at Mason College, Birmingham, was assistant analyst to two successive senior analysts to the Home Office, Sir Thomas Stevenson and Sir William Willcox, and became senior analyst when Sir William Willcox retired in 1919. The great accuracy of his analytical work was proved in the course of a number of notorious trials. During the past 20 years he was pathological chemist to St. Mary's Hospital, Paddington, and had published papers on arsenical poisoning and the toxicology of salvarsan.

The late Mr. A. Oldroyd, a director of the Yorkshire Dyeware & Chemical Co., Ltd., left £118,088 (net personalty £114,398).

The late Mr. R. N. Lennox, F.I.C., of the Lennox Foundry Co., Ltd., and for many years assistant with Sir James Dewar at the Royal Institution, left £1510.

The death has occurred, at the age of 79, of Monsieur F. E. Turpin, who proposed the use of "melinite" (picric acid) as a bursting charge for shells in 1886. Sprengel had shown in 1871 that picric acid could be detonated, but no use was made of his observation until Turpin introduced melinite, also known as lyddite.

Dr. A. Helfenstein, who died recently in Vienna, aged 52, was the originator of the Helfenstein closed electric furnace, developed particularly for the manufacture of calcium carbide and ferro-alloys, but also used for smelting iron ore.

New Chemical Factory in Darlington

According to the *Northern Echo* a new chemical factory is to be built at Darlington by a British firm on a site covering 58 acres. The nature of the new industry is not disclosed, but it is understood that it will relate to a branch of the heavy chemical industry, and that the product is one which has hitherto been largely imported.

British Iron and Steel Output

The output of pig iron during 1926 was 2,441,500 tons, as against 6,261,700 tons in 1925, and the production of steel ingots and castings was 3,560,400 tons, against 7,385,400 tons.

British Trade in 1926

According to official statistics, the average values of imports into Great Britain for 1926 was 8.4% below that of 1924; in re-exports there was an increase over the 1924 values of 12.1% in 1925 and of 4.7% in 1926. Exports diminished in volume, compared with 1924, by 0.7% in 1925 and by 11.3% in 1926, and re-exports similarly decreased by 1.8% and by 14.3% respectively. The trade of 1926 was entirely distorted by the coal stoppage, a large export trade in coal having ceased for seven months and a large import trade in coal bought at high prices having taken its place. The following figures show the values, as declared, of the import and export trade for 1926 (including coal, coke, and manufactured fuel), the figures in brackets being those for 1925:—Total imports, £1,242,864,000 (£1,320,715,000); exports (U.K. goods), £651,893,000 (£773,381,000); exports of imported goods, £125,566,000 (£154,037,000). Omitting coal, the quantities of raw materials imported

and retained in 1926 were practically the same as those imported and retained in 1925 and 6.7% greater than the retained imports of 1924. Excluding coke and patent fuel, wholly or partially manufactured goods increased over 1924 by 12.2% in 1925 and by 16.8% in 1926. The following tables show certain of the declared values of the trade for 1926 and 1925, the 1925 figures being shown in brackets:—

	Total Imports.		Exports of Imported Produce.	
	£1000.		£1000.	
Raw materials and articles, mainly unmanufactured—				
Coal	43,021	(20)	49	(—)
Other non-metallic mining and quarry products etc. . .	5,575	(5,784)	49	(617)
Iron ore and scrap .. .	2,789	(5,108)	3	(1)
Non-ferrous metalliferous ores and scrap .. .	15,231	(16,494)	420	(305)
Oil seeds and nuts, oils, fats, resins and gums .. .	45,483	(55,494)	2,600	(3,495)
Hides and skins, undressed ..	10,556	(21,802)	12,788	(14,384)
Paper-making materials ..	11,946	(11,107)	47	(71)
Rubber .. .	33,516	(20,397)	16,300	(22,129)
Articles wholly or mainly manufactured—				
Coke and manufactured fuel	2,518	(10)	8	(—)
Earthenware, glass, abrasives etc. . .	11,510	(10,092)	21	(248)
Iron and steel and manufactures thereof .. .	20,535	(23,883)	284	(237)
Non-ferrous metals and manufactures thereof .. .	37,113	(38,121)	3,670	(4,208)
Machinery .. .	12,740	(17,901)	1,352	(1,553)
Chemicals, drugs, dyes and colours .. .	15,446	(14,387)	987	(1,211)
Oils, fats and resins, manufactured .. .	43,856	(36,341)	2,138	(3,644)
Leather and manufactures thereof .. .	14,080	(15,067)	1,026	(2,207)

Oils, fats and resins, manufactured .. .	41,718	(32,097)	9,448	(10,227)
Leather and manufactures thereof .. .	12,163	(12,860)	6,882	(7,068)
Paper and cardboard .. .	15,512	(14,825)	9,797	(9,816)
Rubber manufactures .. .	6,834	(5,072)	7,946	(7,616)

Safety in Mines Board Research Station

The Research Station of the Safety in Mines Board at Harper Hill, near Buxton, was completed some three months ago, but the official opening will not be held until the spring. It is understood that the Prince of Wales or another member of the Royal Family will open the station. Minor investigations have already commenced under the supervision of Prof. R. V. Wheeler, the Director of Experiments, and after the opening, work will begin on a more extensive scale.

Centenaries during 1927

January 25 marks the three-hundredth anniversary of the birth of the Hon. Robert Boyle. Other centenaries

which occur during 1927 include those of Newton, Fresnel, Lister, Abel, Volta, J. H. Gladstone, E. Nicholson and M. Berthelot.

The Rubber Situation

In their annual review of the rubber market, Messrs. S. Figgis & Co., of Fenchurch Street, estimate the total shipments of rubber last year at 614,000 tons, and the world's consumption at 545,000 tons; this leaves a surplus of 69,000 tons, which they regard as the addition to supplies in Europe and America to-day. The shipments for the year show an increase of about 100,000 tons, while the consumption is estimated to have declined by 15,000 tons. American consumption shows a reduction of 25,000 tons to 365,000 tons, and in this connexion Messrs. Figgis draw attention to the increased use in America of reclaimed rubber; one estimate puts the amount last year at 125,000 tons, against 90,000 tons in 1925, but many good authorities, it is added, put the figure as high as 160,000 tons, against 125,000 tons in 1925. As regards the future, the review estimates shipments this year, allowing for British restriction at an average of 64 per cent., at 538,000 tons; an increase in European consumption is looked for, and it is thought that 1927 will be a good "replacement" year in America.

(*The Times*, January 18, 1927.)

Sugar Beet Industry

Speaking at a meeting of the Council of Agriculture for England, Mr. Guinness, the Minister of Agriculture, said the sugar beet industry in this country had proved a great success. In 1927 it is estimated that there will be 174,000 acres under sugar beet, an advance of about 44,000 acres on last year. Fourteen factories have been operating in the present season, and it is anticipated that new factories will be erected next autumn at Bardney and King's Lynn. Three other factories will offer increased facilities; at Felsted, Spalding and Kidderminster the capacity will be doubled. The average sugar content so far attained is 17.4, and the yield has increased in at least six factories. These improvements in the yield and in the sugar content make it hopeful that the industry will adjust itself to the inevitable period of decreased prices which must come as the rate of subsidy declines and finally ceases.

Sugar Beet Conference

On January 19 Lord Clinton presided over a well-attended conference of sugar-beet growers and scientific workers at Harpenden, which had been arranged by the Rothamsted Experimental Station and the British Sugar Beet Society. Opening the proceedings, Lord Clinton said the conference was being held at a particularly opportune time, because it was being realised that sugar beet cultivation was one of the most important new cultivations that had been introduced.

Mr. J. M. van Bommel van Vloten (Netherlands Sugar Industry) spoke of the experience of Continental growers, and referred to methods of testing and selecting seeds. Evidence was adduced to show that the weight of the beet and the yield of the sugar both fell as the space between rows was increased above 16 inches, and, discussing the English methods of paying for beet, it was urged that it would be worth while for the factories to pay well for rich beets.

In a paper on "What the factory wants and how the farmer can supply it," Mr. T. G. Fowler, commercial manager of the Cantley Beet Sugar Factory, complained that all growers tried to deliver all their beet when the sugar content was highest, and so starved the factory at one period and glutted it at another. Unless the yield per acre was increased by two or three tons before the subsidy expired, the industry would not be a success in this country. The yield should be from 10 to 12 tons an acre at least. The average farmer was making mistakes in cultivation. If he carried out the correct operations at the correct time and used no fertilisers, he would obtain an increase of two or three tons an acre. If to this proper fertilisers were added, an increase of three to four tons might be looked for.

The results of various experiments on fertilisers for sugar beet were given by Mr. H. J. Page (Rothamsted), who said that this crop demanded more nitrogen, phosphates and potash from the soil than any other. At Woburn the addition of a nitrogenous dressing increased the yield by one ton, but a treble dressing caused a fall of 19 cwt. Ordinary additional dressings of potash gave no increase in yield, but a 30% potash salts dressing added 17 cwt. an acre to the yield. This was more or less confirmed by Mr. R. N. Dowling, of Notts County Agricultural Organisation, who also stated that beet sown with 16½ in. between the rows yielded 13 tons 16 cwt. an acre, beet sown at 19 in. intervals gave 13 tons 13 cwt., and at 23 in. intervals yielded 13 tons 19 cwt.

Mr. I. J. Schapringer, who has had experience in Czechoslovakia, said that sugar beet could stand up to 8 degrees of frost when lifted, and even more when in the ground. Hence the lifting period, and, therefore, the factory working period in England, was from 80 to 100 days, while it was only 60 days in other countries. Thus, with the same capital, England could slice nearly double the quantity of beet. Daylight, as distinct from sunshine, was the maker of sugar in beet, and this explained the higher sugar content in the Northern Hemisphere.

Sir Frederick Keeble observed that the conference had shown that to obtain proper soil conditions was more important than to give the plant "dope." There was hope that the numbers and supplies of nitrogenous fertilisers would shortly be increased very largely. It was of national concern that the question of manures should be fully explored.

Mr. A. W. Ling said many experiments led him to conclude that they could not appreciably alter the sugar content, but they could certainly increase the weight per acre.

Sir John Russell, director of the Rothamsted Station, thanked the speakers, and referred to the fact that most of the varieties of sugar beet grown in England had come from the Continent, and he hoped an improvement might be made in the varieties. There was room for considerable experiment in cultivation, and until that foundation was sure there would be difficulties with manuring.

New Beet Sugar Factory

One of the largest beet sugar factories in the country is to be erected at once at Bardney, near Lincoln, at an

estimated cost of £552,000. It will have an initial capacity for dealing with 1,000 tons, rising to 1,400 tons, per day. A contract has been signed between the Lincolnshire Beet Sugar Company and Sir Robert McAlpine & Sons, the contractors, and the work will be carried out under the supervision of the Dyer Company of America.

Iron Ore in Italy

From Italy come reports of the discovery of deposits of iron ore in the Apuan Alps between Massa and Lucca. The ore—a hematite—is said to contain 41.9% of iron, the percentage increasing with the depth of the lode, which is about 14 ft. wide, and has been traced for a length of half a mile. Great expectations have been raised by the discovery in view of the lack of iron ore in Italy.

International Thomas Slag Cartel

The possibility is being discussed in Germany of the formation of a Thomas slag cartel to include producers in Belgium, France, Germany, Luxembourg, Sarre and Lorraine, representing a total capacity of 3 million tons. The negotiations would, it is suggested, be begun under the auspices of the "Rohstahlgemeinschaft."

Nitrogen-fixation in Iceland

The Dansk-Islandske Anlægsselskab A.-S., of Copenhagen, and the Islands Kemiske Fabriker have obtained a concession for the exploitation of four waterfalls at Arnarfjord, Iceland, and propose to erect plants for the production of nitric acid by the arc process. It is estimated that the four waterfalls will generate approximately 40,000 h.p.—(*U.S. Comm. Rep.*, November 15, 1926.)

Franco-German Potash Agreement

It is reported that the preliminary agreement which was drawn up early in 1926 by the French and German potash industries has been extended for seven years.

Proposed Developments in France

Proposals which are to be submitted by the Ministry of Public Works with the object of developing production, and thus assisting the financial recovery of France, include the development of water power and home production, so as to reduce imports of coal from 20 million tons to 12 million tons; the development of the production of potash and fixed nitrogen; and the creation of an experimental institute to study the production of a fertiliser containing a combination of potash, nitrate and Moroccan phosphate.

State-aided Industry in Japan

A Bill is under consideration in Japan for the encouragement of industry, including the dye and chemical industries, either by the help of a subsidy or by the granting of exemptions from certain taxes. A further increase in the import duty on certain dyes which are made in Japan is believed to be probable.

Artificial Silk Industry in Germany

According to the *Financial Times* a denial has been given to the report that an agreement with the Vereinigte Glanzstoff Werke has given control of the German artificial silk production to Messrs. Courtaulds. It is asserted that only a working association has been reached, without any exchange of shares.

Pulp and Paper in Canada

Price Bros., Ltd., is preparing plans for extending the capacity of the River Bend Mill, Isle Maligne, Quebec, from 200 tons to 400 tons of paper daily.

The Ste. Anne Power & Paper Co. is erecting a paper mill with daily capacity of 250 tons at Beaupre, Quebec. The plant will cost \$4,000,000. The Spanish River & Abitibi Companies, which are controlled by Chicago interests, are interested in this property.

The Canadian Cellulose Company has commenced the erection of a soda mill at Cornwall, Ontario, having a daily production of 50 tons of bleached soda pulp. The mill is expected to be in operation early next year. Suitable pulp-wood is obtainable in large quantities in this section of Ontario.

The St. Regis Paper Co. has contracted for the immediate erection of a large pulp and paper plant at Cap Rouge, on the St. Lawrence River, four miles from the City of Quebec. This makes the second large pulp and paper mill under construction almost within the precincts of the city, the other being the Anglo-Canada in Limoilou ward.

Arrangements have been made with the Government of British Columbia for the erection of a pulp and paper mill, costing about \$30,000,000, near the City of Prince George, B.C. Eastern Canadian industrialists represented by Frank P. Jones, President, Canada Cement Company, Ltd., of Montreal, and Angus McLean, President, Bathurst Company, Ltd., Bathurst, N.B., pulp and paper manufacturers, are interested.

The second of the two additional newsprint machines of the Belgo-Canadian plant of the St. Maurice Valley Corporation is now operating. With its completion the daily output of the company is 885 tons newsprint.

Petroleum and Natural Gas in Canada

The natural gas production of Canada during the year 1925 was 16,902,897 thousand cb. ft., valued at \$6,833,005. The Province of Alberta, with 9,119,500, has become the leading producer, Ontario falling into second place.

At the middle of November the Vulcan well, in Turner Valley, Alberta, blew in with a daily flow of over 10 million cb. ft. wet gas, and this flow has been maintained. Royalite 4, in the same district, which blew into production two years ago, has an average daily output of 18–20 million cb. ft.

Official returns for 1925 show a decided increase in the production of crude petroleum in Canada. Whereas in 1924 the total output from wells was 160,773 barrels (35 gals. per bl.), valued at \$467,400, the production in 1925 amounted to 332,001 barrels, valued at \$1,250,705. Alberta has become the chief producing province due to the oil recovered from the wet gas of Royalite 4, which has averaged 500 barrels daily since it blew in, and is still maintaining this yield.

The Vulcan gas well, with its flow of 10 million cb. ft. of wet gas, is daily yielding 145 barrels of light naphtha of 0.72° Beaume.

Canadian Glass Industry

The value of pressed and blown glass produced in Canada during 1925 was \$7,444,246, and plate, cut, and ornamental glass \$2,673,358, making a total of \$10,117,604, slightly less than the value of the preceding year.

REVIEW

INDUSTRIAL STOICHIOMETRY. By WARREN K. LEWIS and ARTHUR H. RADASCH. Chemical Engineering Series. Pp. xi + 174. London: McGraw-Hill Publishing Co. Ltd., 1926. Price: 12s. 6d.

In view of the rapid strides which have been made in the United States during the last few years in chemical engineering, one naturally turns to this book with curiosity and interest, in order to ascertain whether it truly reflects the advance which has been made. It cannot be denied that the book is of surpassing interest, not only to students of chemical engineering, but to works chemists and chemical engineers.

Industrial stoichiometry relates to the interpretation of data quantitatively, and is of inestimable value. Just as no accountant considers his work complete until his books are balanced, so no works chemist or chemical engineer should regard his task as finished, pending the cross-checking of industrial chemical data, an operation which is apt to be more involved than that of cost accountancy. Process control and the design of equipment involve consideration of three groups of factors. The first comprises the quantity relationships included in the laws of stoichiometry in the narrower sense of that word, i.e., the laws of the indestructibility of matter and of the elements, the laws of combining weights and of the conservation of energy. The second involves the equilibrium relationships of chemical reactions and the third the rate relationships.

In the preliminary presentation of the subject, illustrations are chosen in order to familiarise the beginner with the fundamental concepts, and the subject is made delightfully explicit. The book then deals with fuels and combustion, gas producers, sulphur compounds, lime and cement, the stoichiometry of furnace and kiln design, metallurgy, stoichiometry of plant design, crystallisation and miscellaneous problems.

Altogether, it is an eminently useful contribution to an aspect of industrial chemistry, the importance of which was emphasised by Quinan during the war. The authors certainly merit congratulation. P. PARRISH

COMPANY NEWS

GAS LIGHT AND COKE CO., LTD.

The following dividends have been recommended for the half-year to December 31 last:—On the 4% consolidated preference stock at the rate of 4% per annum; on the 3½% maximum stock at the rate of 3½% per annum, and on the ordinary stock at the rate of 5% per annum, carrying forward £64,647. The year's distribution is thus 5s. 8d.%, as against 5s. 2s.% for 1925.

COMMERCIAL GAS CO., LTD.

A final dividend is proposed of 5s. 6s. 8d.% per annum on the 4% stock and 5s. 3s. 4d.% per annum on the 3½% stock, both less tax. For the first half of the year the dividends were at the same rate, and similar dividends were paid in respect of 1925.

NON-INFLAMMABLE FILM MANUFACTURING CO., LTD.

The formation is announced of the Non-Inflammable Film Manufacturing Company. The chairman of the company is Sir Herbert E. Blain; the board includes Sir John de F. Pennefather, M.P., and Dr. Herbert Levinstein. The capital is 500,000 £1. ordinary and 100,000 1s. deferred shares.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned. Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
Bisulphite of Lime—£7 10s. per ton, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
Copper Sulphate.—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate.—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammoniac.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots, £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included.
Sod. Chlorate.—2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
Arsenic, Sulphide, Yellow.—2s. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 2d. per lb.
Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 per ton. Scarce. Grey, £17 5s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£8 5s.—£10 per ton and upwards, according to grade and locality. Very scarce and fair demand.
 Iron Liquor.—1s. 6d. per gal. 32° Tw.; 1s. 2d. per gal. 24° Tw.
 Red Liquor.—10d.—11d. 16° Tw. per gal.
 Wood Creosote.—2s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 10d.—4s. per gal., 60% O.P. Solvent, 4s. per gal., 40% O.P. Both scarce and in fair demand.
 Wood Tar.—£4—£5 per ton and upwards, according to grade.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carbolie.—Crystals, 6½d.—6½d. per lb. Crude 60's, 1s. 9½d.—1s. 10½d. per gal.
 Acid Cresylic, 99/100.—2s. 3d.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 1d. per gal. Pale, 95%, 1s. 10d.—2s. per gal. Dark, 1s. 9d.—1s. 10d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 3½d.—1s. 4½d. per gal., ex works in tank wagons; Standard motor. 1s. 11½d.—2s. 4½d. per gal., ex works in tank wagons; Pure, 2s. 2½d.—2s. 5½d. per gal., ex works in tank wagons.
 Toluole.—90%, 2s. to 2s. 6d. per gal. Firm. Pure, 2s. 3d.—2s. 8d. per gal.
 Xylol.—2s. 3d.—2s. 8d. per gal. Pure, 4s. per gal.
 Creosote.—Cresylic 20/24%.—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal.
 Naphtha.—Crude, 10d.—1s. 1d. per gal., according to quality. Solvent 90/160, 2s.—2s. 1d. per gal. Solvent 95/160, 1s. 11d.—2s. per gal. Solvent 90/100, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s. per ton.
 Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—117s. 6d.—130s. per ton, f.o.b. according to district. Prices nominal.
 Pyridine.—90/140.—9s. 6d.—17s. per gal. Nominal. 90/180.—7s. 6d. per gal. Heavy.—7s.—10s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—9½d. per lb., naked at works.
 Aniline Salts.—9½d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d.—4½d. per lb.
 m-Cresol 98/100%.—2s. 8½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—7d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 4d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—9d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xyldine Acetate.—2s. 11d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid. Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4d.—2s. 5d. per lb. Firm.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity.
 Acid, Boric B.P.—Cryst. £40 per ton. Powder £44 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s. 21s. per lb.
 Acid, Citric.—1s. 3½d. per lb. Less 5%. Quiet.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in owt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4d.—1s. 6d. per lb. Firm and good enquiry. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 0½d. per lb. Less 5%.
 Amidol.—9s. 6d. per lb. d/d.
 Acetanilide.—1s. 7d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—11s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Aspirin.—2s. 4d. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzonnaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.

- Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr paid any station in Great Britain in ton lots.
- Bromides.—Ammonium.—2s. 3d.—2s. 5d. per lb. Potassium.—1s. 10d.—2s. per lb. Sodium.—2s. 1d.—2s. 3d. per lb. All spot. Market firmer.
- Calcium Lactate.—1s. 5d.—1s. 6d. per lb.
- Chloral Hydrate.—3s. 3d.—3s. 6d. per lb., duty paid.
- Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
- Cresote Carbonate.—6s. per lb.
- Ether meth.—1s. 1d.—1s. 1½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.
- Formaldehyde.—£39 per ton. Ex wharf in barrels.
- Guaiacol Carbonate.—6s. 6d.—7s. per lb.
- Hexamine.—2s. 4d.—2s. 6d. per lb.
- Homatropine Hydrobromide.—30s. per oz.
- Hydrastine Hydrochlor.—English make offered, 120s. per oz.
- Hydrogen Peroxide (12 vols.).—1s. 8d. per gal. f.o.r. makers' works, naked.
- Hydroquinone.—4s. per lb.
- Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
- Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
- Iron Perchloride.—22s. per cwt., 112 lb. lots.
- Magnesium Carbonate.—Light Commercial £33 per ton net.
- Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%; Heavy Pure 2s.—2s. 3d. per lb., according to quantity.
- Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 12s.—13s. per lb., according to quantity. Liquid (95%), 12s. per lb. Detached cryst., 15s. per lb.
- Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb., Levig, 6s.—6s. 1d. per lb.; Corrosive sublimate, Lump, 4s. 8d.—4s. 10d. per lb., Powder, 4s. 2d.—4s. 3d. per lb.; White precip., Lump, 4s. 10d.—5s. per lb., Powder, 4s. 11d.—5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d. per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide, 5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d. per lb.; Sulph. nig., 4s. 10d.—4s. 11d. per lb.
- Methyl Salicylate.—1s. 9d. per lb.
- Methyl Sulphonol.—15s. 6d. per lb.
- Metol.—11s. per lb. British make.
- Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
- Paraldehyde.—1s. 4d. per lb.
- Phenacetin.—3s. 9d.—4s. per lb.
- Phenazone.—5s. 9d.—6s. per lb.
- Phenolphthalein.—6s.—6s. 3d. per lb.
- Potass. Bitartrate.—99/100% (Cream of Tartar) 83s. per cwt., less 2½% for ton lots.
- Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
- Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
- Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
- Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
- Potass. Permanganate.—6½d. per lb. spot.
- Quinine Sulphate.—2s. per oz.—1s. 8d.—1s. 9d. per oz. in 100 oz. tins.
- Resorcin.—4s.—4s. 3d. per lb. spot.
- Saccharin.—55s. per lb.
- Salol.—3s.—3s. 3d. per lb.
- Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
- Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
- Sod. Ferrocyanide.—4d. per lb., carr. paid.
- Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.
- Sod. Nitroprusside.—16s. per lb.
- Sod. Potass. Tartrate (Rochelle Salt).—80s.—85s. per cwt. net, according to quantity.
- Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal, 1s. 10d.—1s. 11d. per lb.
- Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
- Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton, according to quantity, 1-cwt. kegs included.
- Sulphonol.—10s. 6d. per lb.
- Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
- Thymol, Puriss.—12s.—13s. per lb., according to quantity. Cheaper. Natural.—14s. 9d. per lb. Very firm.

PERFUMERY CHEMICALS

- Acetophenone.—7s. 3d. per lb.
- Aubepine (*ex Anethole*).—10s. 6d. per lb.
- Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb. Amyl Salicylate.—3s. per lb.
- Anethole (M.P. 21/22° C.).—5s. 8d. per lb.
- Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.
- Cinnamic Aldehyde.—Natural, 17s. per lb.
- Coumarin.—11s. per lb.
- Citronellol.—15s. per lb.
- Citral.—9s. 6d. per lb.
- Ethyl Cinnamate.—10s. per lb.
- Ethyl Phthalate.—3s. per lb.
- Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—19s. per lb. Geraniol.—9s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Shui Oil*) 12s. per lb.—(*ex Bois de Rose*) 16s. per lb. Linalyl Acetate.—(*ex Shui Oil*) 14s. 6d. per lb.—(*ex Bois de Rose*) 18s. per lb.
- Methyl Anthranilate.—9s. per lb.
- Methyl Benzoate.—4s. 6d. per lb.
- Musk Ketone.—36s. per lb.
- Musk Xylol.—8s. 6d. per lb.
- Nerolin.—3s. 9d. per lb.
- Phenyl Ethyl Acetate.—12s. per lb.
- Phenyl Ethyl Alcohol.—11s. per lb.
- Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 6d. per lb. Vanillin.—19s. per lb.

ESSENTIAL OILS

- Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—29s. per lb. Bourbon Geranium.—11s. 3d. per lb.
- Camphor.—63s. 6d. per cwt. Cananga, Java, 20s. per lb.
- Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure.—6s. per lb.
- Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 19s. per lb. Lemon.—8s. 3d. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—9s. 9d. per lb.
- Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 23s. 6d. per lb. Japanese, 9s. per lb.
- Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 20s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Mar. 19th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Feb. 3rd. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

1.—Applications

- A.-G. Brown, Boveri, et Cie. High-pressure vessels etc. 1189. Jan. 14. (Ger., 161.26.)
- Bojner and Pehrson. Apparatus for heating charge in rotary furnaces. 975. January 12. (Sweden, 201.26.)

Carrier Engineering Co. Controlling saturation temperature of gases. 884. Jan. 11.

Heide (Gaisman). Grinding-machines. 648. Jan. 10.

Kearley and Morrice. Centrifugal apparatus. 796. Jan. 11.

Lanyon. Refrigeration. 877. Jan. 11.

Marks (Selden Co.). Catalytic oxidation. 752. Jan. 10.

Parker, and Vickers, Ltd. Grinding-mills. 734 and 761. Jan. 10.

Quiggin. Distilling-apparatus. 1128-9. Jan. 14.

Synthetic Ammonia & Nitrates, Ltd., and Humphrey. Centrifugal apparatus. 1227. Jan. 15.

I.—Complete Specifications

24,696 (1925). Tintometer, Ltd., and Lovibond. Colour-estimating apparatus. (263,924.)

5082 (1926). Krupp, Grusonwerk. Expressing liquid constituents from materials. (248,372.)

23,817 (1926). Zwicky. Filters. (258,905.)

*21,714 (1926). Svensson and Norling. Centrifugal treatment of liquids. (264,130.)

II.—Applications

Blythe. Chlorination of coal under pressure. 942. Jan. 12.

Donald. Carbonisation of coal etc. 787. Jan. 11.

Easton. Retorts for lignite etc. 819. Jan. 11.

Hobson. Distilling fuel etc. 672-3. Jan. 10.

Hughes (Fujisawa). Manufacture of active carbon. 1068. Jan. 13.

Huntington. Removal of wax from petroleum etc. 1022. Jan. 13.

Internat. Bergin-Corp. voor Olie en Kolenchemie, and Debo. Hydrogenation of hydrocarbon compounds. 731. Jan. 10.

Johnson (I.-G. Farbenind.). Manufacture of unsaturated hydrocarbons. 701. Jan. 10.

Lessing. Separation of powdered etc. coal etc. 856. Jan. 11.

Parsons and Stoney. Cooling, dehydration, etc. of oil. 988. Jan. 12.

Verein für Chemische Industrie A.-G., and Walter. Process for producing products of unsaturated hydrocarbons. 851. Jan. 11.

II.—Complete Specifications

• 24,814 (1925). Davidson, and Patent Retorts, Ltd. Distillation of carbonaceous substances. (263,933.)

24,813 (1925). Davidson, and Patent Retorts, Ltd. Gas-producers. (263,932.)

24,891 (1925). Tapping. Binder for briquetting fuels, minerals, etc. (263,942.)

5703 (1926). Petroleum Chemical Corp. See XX.

*444 (1927). Internat. Combustion Engineering Corp. Treatment of coal. (264,169.)

III.—Application

Internat. Bergin-Corp. voor Olie en Kolenchemie, and Debo. 731. See II.

III.—Complete Specification

30,914 (1925). Soc. Etabl. Barbet. Apparatus for preliminary treatment of crude benzols. (244,130.)

IV.—Applications

Carpmael (I.-G. Farbenind.). Reduction of aromatic nitro-compounds. 1082. Jan. 13.

I.-G. Farbenind. Manufacture of grey to black dyestuffs. 960. Jan. 12. (Ger., 12.1.26.) Manufacture of alkyl-pyrazolanthrones. 961. Jan. 12. (Ger., 13.1.26.) Manufacture of carbazolequinones. 1292. Jan. 15. (Ger., 15.1.26.)

Scottish Dyes, Ltd., Drescher, Harris, Thomas, and Wylam. Dyes etc. 746. Jan. 10.

IV.—Complete Specifications

19,739 (1925). Wylam, Harris, Thomas, and Scottish Dyes, Ltd. Preparation of dyes, colouring-matters, etc. (263,898.)

24,696 (1925). Tintometer, Ltd., and Lovibond. See I.

V.—Applications

British Dyestuffs Corp., and Hailwood. Manufacture of artificial textile fibres. 966. Jan. 12.

Calico Printers' Assoc., Levin, and Whinfield. Acetyl cellulose artificial silk. 1071. Jan. 13.

Courtaulds, Ltd., and Stokes. Production of artificial threads etc. 1277. Jan. 15.

Heberlein & Co. Improving artificial fibres. 1291. Jan. 15. (Ger., 15.1.26.)

Naaml. Vennoots. Nederlandsche Kunstzijde-fabriek. Apparatus for manufacture of artificial silk etc. 922. Jan. 12. (Holland, 17.12.26.)

Schaub. Manufacture etc. of nitrocellulose. 1197-8. Jan. 14.

Soc. Lyonnaise de Soie Artificielle, and Chevalet. Preparation of modified cellulose. 703. Jan. 10. (Fr., 11.1.26.)

Cellulose product. 704. Jan. 10. (Fr., 22.2.26.)

Strocker. Production of cellulose. 1069. Jan. 13.

V.—Complete Specifications

24,867 (1925). Dreyfus. Treatment of cellulosic materials. (263,938.)

24,868 (1925). Dreyfus. Manufacture of cellulose derivatives. (263,939.)

14,764 (1926). Grand. Production of artificial silk yarns. (253,547.)

*331 (1927). Lilienfeld. Manufacture of artificial materials from viscose. (264,161.)

*703 (1927). Soc. Lyonnaise de Soie Artificielle, and Chevalet. Preparing a modified cellulose. (264,181.)

VI.—Applications

Hill. Production of finishing effects on textile fibres etc. 634. Jan. 10.

Lord. Apparatus for treating hanks of yarn with liquids. 1033. Jan. 13.

Silver Springs Bleaching & Dyeing Co., Ltd., Hall, and Mason. Production of piece-dyed woven fabrics. 928. Jan. 12.

VI.—Complete Specifications

25,053 (1925). British Alizarine Co., Ltd., Dawson, and Soutar. Dyeing acetyl silk. (263,946.)

*32,421 (1926). I.-G. Farbenind. Treatment of animal fibres. (264,146.)

VII.—Applications

Aluminum Co. of America. Production of sodium aluminum etc. 895. Jan. 11. (U.S., 21.1.26.)

Auchinachie, Blackburn, and Thomas. Manufacture of ammonia. 1211. Jan. 14.

Holmes, Jardine, and Kingcome. Apparatus for recovery of soda ash. 814. Jan. 11.

Hüttenwerke Tempelhof A. Meyer, and Meyer. Manufacture of copper sulphate. 986. Jan. 12. (Ger., 13.1.26.)

I.-G. Farbenind. Manufacture of phosphorus oxides. 1164. Jan. 14. (Ger., 15.1.26.)

Johnson (I.-G. Farbenind.). Manufacture of sulphuretted hydrogen etc. 700. Jan. 10.

Soc. d'Etudes Minières et Industrielles. Manufacture of ammonia. 1173. Jan. 14. (Fr., 6.7.26.)

* Woosnam (Norsk Hydro-Elektrisk Kvaestofaktieselskab). Production of hydrogen etc. 732. Jan. 10.

VII.—Complete Specifications

16,874 (1926). Spence & Sons, Ltd., Kirkham, and Spence. Manufacture of titanium compounds. (263,886.)

24,686 (1925). Haynes. Manufacture of carbon dioxide. (263,922.)

VIII.—Applications

Imray (Hirao, Suzuki, and Suzuki). Manufacture of abrasives. 1290. Jan. 15.

Moss. Ovens for firing bricks etc. 1238. Jan. 15.

Scheidhauer & Giessing A.-G. Producing refractory etc. products. 869. Jan. 11. (Ger., 11.1.26.)

Soc. Anon. des Manuf. des Glaces et Prod. Chim. de St. Gobain. Glass. 707 and 837. Jan. 10 and 11.

VIII.—Complete Specifications

23,272 (1926). Soc. La Radiotechnique. Low-expansion glass. (258,872.)

*869 (1927). Scheidhauer & Giessing A.-G. Producing refractory acid-proof products. (264,192.)

IX.—Applications

Batchelor. Apparatus for distributing liquids etc. in kilns in manufacture of cement etc. 941. Jan. 12.

Goodall. Drying, fireproofing, or dyeing timber. 930. Jan. 12.

Jones. Road-surfacing material. 748. Jan. 10.

La Trinidad. Manufacture of asphaltic etc. emulsions. 801 and 893. Jan. 11. (Fr., 12.1.26.) Manufacture of asphaltic etc. products. 892. Jan. 11. (Fr., 25.1.26.)

Coatings for roadways. 1251. Jan. 15. (Fr., 29.10.26.)

IX. Complete Specifications

27,654 (1925). Alchemin A.-G., and Lichtenstern. Impregnating unpaved roads. (263,975.)

4711 (1926). Itier. Rendering cement liquid-tight* and impervious to chemical agents. (247,976.)

X. Applications

A.-G. Brown, Boveri, et Cie. Electric resistance annealing-furnaces. 1046. Jan. 13. (Ger., 19.5.26.)

British Thomson-Houston Co., Ltd. Protective coatings for metals etc. 713. Jan. 10. (U.S., 9.1.26.)

Browne. Production of silicon iron. 709. Jan. 10.

Dassdorf, Henning, Lehnig, and Loos. Coating metal etc. articles. 849. Jan. 11.

Electric Furnace Co., Ltd., and Campbell. Refining metals. 1293. Jan. 15.

Kropf. Alloys. 1278 and 1282. Jan. 15. (Ger., 16.1.26 and 10.5.26.)

McConnachie. Preparing materials for blast furnaces etc. 1166. Jan. 14.

Metallbank und Metallurgische Ges. Purifying aluminium etc. 1055. Jan. 13. (Ger., 8.2.26.)

X.—Complete Specifications

24,801 (1925). Tapping. See II.

*6328 (1926). Siemens & Halske A.-G. See XI.

*31,283 (1926). Meyer and Meyer. Recovering antimony from alloys. (264,139.)

*713 (1926). British Thomson-Houston Co., Ltd. Protective coatings for metals. (264,183.)

XI.—Applications

A.-G. Brown, Boveri, et Cie. 1046. See X.

Godfree and Macartney. Electrolyte. 870. Jan. 11.

Joseph. Primary electric batteries. 716. Jan. 10.

XI.—Complete Specification

*6328 (1926). Siemens & Halske A.-G. Electrolytic refining of copper. (264,116.)

XIII.—Applications

Arnot. Production of resinous media. 1204. Jan. 15.

British Thomson-Houston Co., Ltd. 713. See X.

Franko. Production of red-lead paints etc. 742. Jan. 10. (Ger., 15.1.26.)

XIII.—Complete Specifications

24,696 (1925). Tintometer, Ltd., and Lovibond. See I;

2360 (1926). McMinn. Anti-corrosive paint. (264,022.)

*713 (1927). British Thomson-Houston Co., Ltd. See X;

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Industrial chemicals, road-making and rubber manufacturing machinery (41); Solid drawn steel flue and boiler tubes (A.X. 4123); Steel boiler

plates (A.X. 4121); Solid drawn brass boiler tubes (A.X. 4122); Solid drawn copper flue tubes (A.X. 4124). *Brazil*: Leather, galvanised pipes, tinplate, copper (67). *British India*: Stationery, drugs, patent medicines (45). *Egypt*: Scientific and electrical apparatus (B.X. 3156). *France*: Paper (56). *Germany*: Heavy chemicals, tar products (58). *New Zealand*: Galvanised bolts and nuts, copper and bronze wires, tinplate (48). *Salvador*: Galvanised corrugated sheets (69). *South Africa*: Chemists' and druggists' sundries (52); Enamelling plant (A.X. 4116). *Uruguay*: Galvanised iron water piping, tin, white metal, rolled silver solder, brass, copper, iron steel (A.X. 4119).

United States Trade in Chemicals

Imports of chemicals and allied products into the United States during the first nine months of 1926 showed little change in value from the corresponding period of the previous year. Exports, however, rose by 6%.

A New Pyrometer

The Cambridge Scientific Instrument Co., Ltd., 45, Grosvenor Place, London, S.W.1, have produced a pyrometer for taking the temperatures of heated curved surfaces under working conditions. The apparatus is easy to use, light and gives a reading in three to five seconds. It is used particularly for measuring the temperatures of hot rollers used in textile, rubber, linoleum and paper-making, the ranges being from 0–200° C. and 0–400° F.

New Dyestuffs

A further addition to the water soluble colours for lake making made by the British Dyestuffs Corporation, Ltd., is Lake Orange O, which possesses a bright fiery orange shade, being distinctly redder than Acid Orange G. Lake Orange O finds its principal use in the production of a brilliant reddish orange lake for paper-surfacing and printing-ink colours. It is also of value for use in the preparation of imitation red leads. It is soluble in water, and gives the best results when converted into a barium lake.

Of interest is the B.D.C. pattern card of Fashionable Shades, Spring, 1927, which includes patterns of Picasso, Larkspur, Rubric, Naples, Cocoa, Heather, Lime Green, Lagoon, Pompadour, Sedge, Caramel, Gorse and Mist. The dyeing of these colours is carried out in the usual way for acid colours, with the addition of 10% Glauber's salt and 2% sulphuric acid.

Pigment and Lake Colours

Some time ago John W. Leitch & Co., Ltd., Milnsbridge Chemical Works, Huddersfield, issued a selection of the firm's range of pigment and lake colours. We have now received samples of the following additions to the range, namely pigment fast scarlet BL, pigment fast red 5RL extra, lake fast Bordeaux BKL, and lake fast Bordeaux GKL, all in full and pale shades. These colours, it will be remembered, are of excellent fastness, and are used in the manufacture of paint, distempers, ink, wall-papers, and so on.

Filtration

The Premier Filterpress Co., Ltd., of Finsbury Pavement House, London, E.C.2, have sent a photo-frame

calendar for 1927, which is both neat and distinctive, and reminds us, albeit most modestly, of the filterpresses, pumps, diaphragm pumps, filter cloth, and other products made by this company.

Plant

United Water Softeners, Ltd., have received an order for a number of water-softening plants from the Great Southern Railway of Ireland.

The Hinckley Urban District Council Gas Department has placed an order with the Woodall-Duckham Vertical Retort & Oven Construction Co. (1920), Ltd., for a second installation of continuously-working vertical retorts, with a carbonising capacity of 60 tons of coal daily.

PUBLICATIONS RECEIVED

THE DYEING OF COTTON FABRICS. By Franklin Beecel. Third edition, revised and enlarged by A. J. Hall, B.Sc. Pp. xii+296. London: Ernest Benn, Ltd., 1927. Price 18s.

THE CHEMICAL AGE YEAR BOOK, DIARY AND DIRECTORY. Pp. 155. London: The Chemical Age Offices at Benn Bros., Ltd., 1927.

THE STRUCTURE OF THE ATOM. By E. N. Da C. Andrade, D.Sc., Ph.D. Third edition, revised and enlarged. Pp. xviii+750. London: G. Bell & Sons, Ltd., 1927. Price 30s. net.

TREATISE ON THERMODYNAMICS. By Dr. Max Planck. Translated with the author's sanction by A. Ogg, M.A., B.Sc., Ph.D., F.Inst.P. Third edition, translated from the seventh German edition. Pp. xiv+297. London: Longmans, Green & Co., Ltd., 1927. Price 15s.

EDITORIAL

The Chemical Industry

MANY accounts have been prepared of the state of the chemical industry of this country; these have varied in their accuracy and importance. The Association of British Chemical Manufacturers, as stated by the President of the Society of Chemical Industry at Birmingham, has recently prepared a valuable monograph on the chemical industry of the world. A German monograph was prepared last autumn, and we understand that a few copies were issued in this country just before Christmas. It speaks well for the industry and determination of those in charge of the A.B.C.M. that the British monograph, giving a mass of well-arranged statistics, should have been prepared in the very short space of a fortnight and circulated within three or four days thereafter. It was a great achievement, and it is a pity that the German monograph cannot be criticised or discussed in public, and that the English one can only be mentioned in guarded and general terms. It is not possible to give reliable figures of the chemical industry of the world; some countries include in such industry the soap industry, the artificial silk industry, and the paint and varnish industry; other countries exclude some or all of these. Although accurate statistics are not available, it is clear that in many countries the chemical industry has grown very rapidly in recent years, and in many branches the present capacity now exceeds the demand. This is partly due to the war; plants for the manufacture of munitions of war grew up in great numbers in very many countries, whether belligerent or not, and the phrase "munitions of war" includes a great variety of materials; the war, by restricting imports and exports, brought home to many people the inconvenience of being dependent for essential materials on a foreign country which is involved in a war and unable to undertake its accustomed supply. Germany had in some branches of the chemical industry become recognised as the usual supplier of materials to many other countries, and when this source of supply was shut off, the other countries determined to arrange for at least a partial supply within their own boundaries; this determination was put into practice so soon as peace was declared. The production of synthetic nitrogen compounds is increasing rapidly in Europe, Asia and America, and for the time being may exceed the demand; the capacity for production of aniline dyes in the world has doubled since the war, but the demand has remained

nearly the same; the productive capacity for sulphuric acid of many of the leading industrial countries is very much in excess of their demands. Many European countries which formerly imported large quantities of superphosphate, erected new plants and now meet their home needs from their own resources. It is estimated that in Germany the output of aniline dyes is less than a third of the works' capacity, in the United States and in Italy about a half, in Great Britain less than a half, and in no country so much as three-quarters. So far as synthetic nitrogen is concerned, it seems likely that the manufacture of nitrogenous fertilisers is certain to increase; Dr. J. Lipmann, of New Jersey, thinks that twenty million tons of pure nitrogen are annually removed from the soil of the United States; to what extent this amount is replenished by bacterial agencies we do not know; that it is not greatly restored in the shape of nitrogenous fertilisers is obvious, for the whole production of these in the world is only one and a quarter million tons a year. It is interesting to note that the consumption of nitrogen for agricultural purposes in the United Kingdom and Ireland is about $6\frac{1}{2}$ lb. per acre of arable land; this is half the consumption in Germany, and a quarter the consumption in Belgium. We do not know whether this remarkable difference is due to the difference in scientific knowledge in the three countries, or to the fact that the clay soils of many parts of England retain the nitrogen longer than the sandy soils of some parts of Germany and Belgium, or to both these factors. It is worthy of note that in estimating the cost of fertilisers, nitrogen costs more than potash or phosphorus; we should welcome more information as to the calculations involved in this statement. The question of fertilisers is a great one; half the world's production of sulphuric acid goes to make superphosphate, and a good deal of the remainder goes to make sulphate of ammonia. The aniline dye question is also important; we shall return to this next week. Industries which advance very slowly may, it is conceivable, increase their production in excess of the demand, and then wait a few years until the natural growth of the demand has overcome this excess. Such a course is hardly possible in an industry which changes so rapidly as the chemical industry; we think of the rise of synthetic indigo and synthetic ammonia, largely German in their origin, of the rise of artificial silk, largely British in origin, of synthetic varnishes, largely American, of other discoveries made

in France and Italy: what will be the state of Billingham ten years hence, or of Larderello? No one can say, but it is easy to see that no reliance can be placed on the hope that in a few years' time the demand for a particular substance will be double its present demand, and that plant now standing idle can be economically used for its production at that date. It has taken us a long time to understand the post-war conditions: in all probability in another six or eight years we shall have settled down pretty well. The pacification of Europe should then be an accepted fact: the disarmament question will then either be settled or recognised as a perpetual problem always facing us: the munition factories cannot be wholly separated from the potential munition factories. Experience has taught us all many things: first, that war is futile and ruinous, and, secondly, that in time of war a powerful and well-organised chemical industry can improvise methods of preserving the unwarlike members of the community, while it is also busy with means of offence and defence. Economics should guide us largely: that war is still a possible result of human ambitions, fears and passions, is a fact which teaches us not to rely exclusively on economics. No civilised country can run the risk of neglecting any large department of the chemical industry.

The Use of Coke Oven Gas for Town's Supply

There is a growing demand for the co-ordination of ideas relating to fuel, and in this the Fuel Section is playing its part. In our issue this week we publish an outstanding paper by Dr. E. W. Smith, Honorary Secretary of the Fuel Section, on a subject in which co-ordination is badly needed. Carbonisation of coal is undertaken by two industries - the gas industry and the coke oven industry. To the former, gas is the main product, but to the latter, coke is the main product. Yet these two great industries, with so many common interests, have had little understanding of each other's problems. Modern coke ovens produce large quantities of surplus gas, for which the coke oven managers seek an outlet. But they cannot expect to come to a satisfactory commercial agreement with a gas company until they understand the requirements and obligations of those whose responsibility it is to maintain the supply of gas to a town. Dr. Smith, in his paper, with his almost unique knowledge of both industries, holds the balance carefully, and shows both the gas engineer and the coke oven manager their obligations and opportunities. Dr. Smith suggests that the National Fuel and Power Committee might well be asked to report on the subject of the supply of coke oven gas for town's purposes, with special regard to the methods of ensuring maintenance of supply in times of labour and other difficulties. It is by attention to matters like this that the Board of Trade Committee could play an important part in the co-ordination of fuel supplies. The carbonisation of coal is also of prime importance in connexion with the supply of tar, pitch, intermediates, ammonia, nitrogenous fertilisers, disinfectants, and dyes. It may some day yield us oils and motor spirits, but this is not yet a business certainty. We are glad that the Fuel Section is tackling the subject in a broad and comprehensive manner.

THE USE OF COKE OVEN GAS FOR TOWN'S SUPPLY*

By E. W. SMITH, D.Sc., F.I.C.

To-day, few gas engineers question whether or not satisfactory gas can be supplied from well-run batteries of regenerative coke ovens, if the necessary care be taken to comply with their own requirements of supply. This last reservation is not a serious one, and where difficulties have arisen they have been due to a pardonable lack of experience at the coke oven end of gas practice which would not have arisen if there had been more co-ordination between the two sides.

The subject is a big one, and it is impossible to devise a detailed scheme which would be applicable in all cases, but there are some fundamental questions which need careful consideration before some gas engineers will give serious thought to the purchase of coke-oven gas for town's supply.

There will have to be a greater appreciation of, and sympathy for, the legal obligations of the gas authorities to the public in maintaining an adequate supply of gas made to a definite specification. A coke oven manager may sell his coke to sample, or on his reputation, or to an agreed analysis. At the worst, he will lose a customer in an open market if he fails in his obligations. The gas engineer not only loses his custom, but is often subject to public criticism, and his company may be fined by the Board of Trade for failure to comply. It is consequently an essential duty of the gas engineer to insist on all necessary restrictions in the supply of coke oven gas, if he is to maintain his obligation to the public--all the more necessary as he is responsible for a monopoly in his own area.

At the present time some eighteen gas undertakings are taking gas from coke ovens. The experience of most of these undertakings during the coal stoppage was a sorry one, and but for standby plant, would have been more serious. This strike experience lays stress on the primary consideration in the extended use of coke oven gas in town's supply, which is--"What can be done to ensure as great a certainty of maintenance of supply as exists under present conditions, in which the gas engineer has entire charge of his own production in an industry that is less affected by labour troubles than the coal and coking industry?"

Interruptions of supply may be due to the following causes:

1. Strike at the colliery.
2. Strike at the coke ovens.
3. Depression in the coke market, leading the coke oven people to desire to shut down their coke ovens.
4. Blockage on the main between coke ovens and gasworks.
5. Termination of the agreement between coke ovens and gasworks.

* From a paper read before the Midland Section of the Coke Oven Managers' Association at Sheffield, on January 26.

Constancy of supply of gas can be assured under the first head, when not accompanied by a strike at the coke ovens, by keeping a sufficient stock of coal, say four to six weeks' supply, at the coke ovens. A strike at the coke ovens can only be dealt with by having a spare plant at the gasworks. Most gas engineers would consider it necessary, when using coke-oven gas, to have a complete standby plant at the gasworks, ready to be put to work at a moment's notice, not only to deal with temporary stoppage of supply through strikes, but also so that they will not be entirely stranded at the termination of the period of agreement. Many of the agreements made many years ago, when coke-oven operators were willing to accept 4d. per thousand, are now terminating, and the coke-oven operators, realising the value of their gas, are only offering to renew agreements at a price many times this figure. Unless the gas undertaking has a proper standby in good condition, it is in a very weak position for bargaining with the coke-oven operators.

Blockage on the main between coke ovens and gasworks has been known, due to supplying crude gas from the coke ovens, which has not been properly freed from tar, and which may contain very considerable quantities of naphthalene. This difficulty can be provided for in new contracts.

If the coke ovens are producing domestic coke, then the question of the depression of the coke market is not so important as if the coke ovens were producing a metallurgical coke only.

In the past, gas engineers, taking coke-oven gas, have kept complete standbys in the form of carbonising plants in most cases. These have had to be maintained, and would later on have to be extended. It would be cheaper, where necessary, to keep a carburetted water-gas plant as a standby from every point of view, and would be quicker to start up. Having a standby plant, the provision of the necessary men must be considered. It has been found satisfactory to keep a nucleus of experienced retort-house men on the gasworks who can be put on to the work of gas-making in times of emergency. During the interval these men have been occupied in selling coke, generally purchased from the coke ovens. It was also necessary to keep a stock of coal at the gasworks, and, further, in order to preserve the coking and gas-making properties of the coal, this coal has to be renewed every few months. This is generally done by selling the coal for household purposes, gradually replacing it by fresh coal.

The coke-oven manager, if he wants to sell his surplus gas, will have to give more thought as to what arrangements he can make for the maintenance of his supplies. Can he give the same guarantees as to continuity as the gasworks? It should in some cases be possible.

Some coke-oven owners appear to have the belief that, if a gas undertaking is selling its gas at, say, 3s. 6d. per 1,000, it should be able to pay 10d. to 1s. 4d. for unpurified gas at inlet to gasworks purifiers, and make a substantial profit. This is by no means true, and the sooner these gentlemen make a study of the position from the gas undertaking's point of view the better.

The fundamental difference between the two industries, from the point of view of costs, is that, in the gas industry,

gas is the main product, and the net difference between all charges, including dividends and the receipts from residuals (by-products) is met by the receipts from the sale of gas. Variations in the price of gas can be made at the discretion of the gas undertaking, but the undertaking cannot make the progress it desires unless the charges for gas are attractive to the consumer.

The coke-oven industry has for its main product coke, which stands in relation to the coking industry as gas stands to the gas industry—except that, after determining the remunerative selling price of coke, it has to meet other coke in direct competition. The ultimate costs in each industry cannot be usefully compared, except to indicate their essential differences. Coke-oven gas, supplied direct to steel works, can be sold at a much higher rate, bringing a greater return to the coke-oven owner than it could command from a gas undertaking. Coke-oven gas has to bear no capital charges from the coke ovens. It is a by-product pure and simple. Gas made on gasworks has to bear all capital charges.

The price it is possible for the gas engineer to pay for coke-oven gas is determined first by the cost at which he can manufacture gas into the holder on his own works. This cost is made up of the following items:—

- A. Cost of coal after deducting value of residuals.
- B. Carbonising wages.
- C. Works salaries.
- D. Wear and tear.
- E. Purification.

Of these items, when a supply of purified coke-oven gas is taken, the wages figure would probably be reduced by a third. The salaries bill would also be reduced, but this is generally only a small figure, and need not be considered as altered very much. The purification figure would be eliminated. In place of the wear and tear item, would have to be a contribution to a sinking fund, which would provide the money for putting the retort house into first class order, and replacing it with modern plant, should the coke oven gas supply terminate. This figure would probably, for the first year or two after the coke-oven gas supply is commenced, not be very different from the ordinary figure taken for wear and tear, but this can be progressively reduced. This is almost the largest single item in the case of gas manufacture, and the saving effected on this head would enable an appreciable reduction in the price of gas to be effected, irrespective of the cheaper price of gas from the coke ovens.

One other point arises. The gas engineer who takes a supply of coke-oven gas would naturally wish to be in as favourable a position as, say, a neighbour gas engineer who is making his own gas, to reduce the price of gas, as the price of coal and value of residuals varies. In order to meet this, the gas engineer generally requires to have a sliding scale, which is based on the price of coal.

Should coke ovens supply unpurified gas, the gas undertaking will have to provide purifiers, holders and governors to deal with the coke-oven gas, and it is often not realised what bearing these charges have on the cost of production of gas.

I have prepared the following table of capital cost figures for a typical gasworks, which gives a good comparative picture of expenses under this head.

Apportionment of the capital cost of a gasworks (Works only).

Basis: 24 million cb. ft. per maximum day of 200 working days per year			
	Carbousing plant and house	Purifiers and shed	Holders
Estimated cost	£116,000	£27,600	£138,000
Percentage of total works cost	25.2%	6.0%	30.2%

Gas undertakings must provide a renewals fund, which shall provide for the upkeep of plant kept in reserve and also be sufficient for the provision of the most modern type of plant if and when necessity arises. In the accounts of most undertakings there will be found a figure of about 7d. per thousand, which is the amount put away to such a renewal fund, and is included in works' costs.

Another matter that a larger gas undertaking has to consider in the utilisation of coke-oven gas is the question of load. There are daily and hourly fluctuations that are provided for by hourly holder capacity. The usual Sunday morning load is frequently in great excess of the hourly or daily manufacturing capacity of the works, and reserves are accumulated during the week. Sudden fogs or cold weather are sources of sudden increase of output. These demands are supplied from holder stocks, and often from water-gas plants, and modifications in the manipulation of the carbousing plants. There are, too, the seasonal fluctuations. The daily mid winter load is often twice the daily midsummer load. The coke ovens should feel the effect of fluctuations at least as much as the gasworks plant, and the holder capacity of the combined coke ovens and gasworks should be equal to one day's maximum output, and it would often be of advantage for a proportion of the holder capacity to be at the coke ovens.

The purification of coke-oven gas can be done at the gasworks if plant is available. If not, it is advantageous for the gas to be purified at the coke ovens. Almost everything depends on whether or not conditions can be so adjusted as to ensure as great a security of supply from the coke ovens as from gasworks. If such security can be attained, coke ovens would be well advised to study the problem of water-gas production for themselves, which would enable them to provide for town's purposes a gas available for use anywhere *en route*, and be put into town's mains at any desirable point. It would also provide an outlet for surplus coke made at the coke ovens.

One of the problems that has to be handled is that of transmission of gas from the coke ovens to the gasworks. What size of mains and what pressures shall be employed? Each case has its own special features, but it may be of interest if I put before you the following figures based on actual experience and known costs. It will be noted that, although no one pressure is the cheapest for all quantities of gas to be compressed, pressures between 10 and 30 lb. per sq. in. would appear to be the range to be employed. The figures are based on the size of main corresponding with the quantities of gas to be delivered.

Total cost of distribution in pence per 1000 cubic feet (Amortisation in 20 years)

Quantity of gas, cb. ft. per day	Length of main (Miles)	Inlet pressure in lb. per sq. in.				
		5	10	20	30	40
5 million	5	0.704	0.740	0.870	0.936	1.048
	10	1.074	1.062	1.142	1.199	1.292
	15	1.491	1.425	1.420	1.468	1.554
	20	1.950	1.805	1.768	1.713	1.784
	25	0.534	0.577	0.700	0.799	0.906
10 million	5	0.782	0.779	0.877	0.953	1.049
	10	1.048	0.989	1.057	1.110	1.208
	15	1.310	1.240	1.249	1.253	1.348
	20	0.481	0.535	0.603	0.743	0.872
	25	0.678	0.692	0.704	0.854	0.979
15 million	5	0.885	0.866	0.943	0.989	1.093
	10	1.103	1.015	1.000	1.124	1.221
	15	0.449	0.504	0.625	0.731	0.843
	20	0.609	0.620	0.750	0.827	0.930
	25	0.758	0.779	0.859	0.941	1.028
20 million	15	0.952	0.920	0.980	1.039	1.120

The figures in italics show minimum costs.

Taking a typical example of two million a day, the following figures show that the cost of distribution is not more than 2d. per 1000 cb. ft. for a distance of ten miles.

Cost of distribution of coke-oven gas

Basis :-

2 million cb. ft. per day.	
C.V. 550	S.G. 0.45 (air=1).
Therms	11,000 per day.
Distance	10 miles.
Size of main	10 inches.
Inlet pressure	10 lb. per sq. in.
Outlet pressure	1 lb. per sq. in.
Cost of main and lay- ing same	£32,400.
Interest and deprecia- tion	1.6 pence per 1000.

<i>Cost of Compression.</i>	<i>Per 1000</i>	<i>Per therm.</i>
	d.	d.
Capital charges (15%)	0.148	
Steam at 18d./1000 lb.	0.310	
Labour	0.103	
Oil etc.	0.030	
	0.591	0.107
Add cap. charges on main	1.600	0.291
Total cost of distribution	2.191	0.398

NOTE. This could be reduced if a higher inlet pressure were used as minimum cost of distribution is obtained in general with low pressures for large volumes with high pressures for small volumes.

Sometimes one heard that changes in specific gravity may have serious effects on distribution costs and cause difficulties. It will be seen that within all practicable town's gas ranges, the effect cannot be more than 2-3% as expressed by the changes in size of main that would have to be made to maintain the same conditions.

Variation of size of main for same volume but varying specific gravities

Specific gravity (Air = 1)	Diameter of Main Inches	Increase per cent.
0.45	9.5	
0.50	9.7	2.1
0.60	10.1	5.0
0.70	10.4	9.2
0.80	10.6	12.2
0.90	10.9	14.9

Thus, the cost of distribution per 1000 cb. ft. would be approximately the same, but the cost *per therm*

(since high specific gravity in general denotes low calorific value) would increase in inverse proportion to the C.V.

It is only when distributing producer gas that such difficulties occur, due to the high percentage of inerts, and I believe that the majority of gas engineers agree that, whatever calorific value may be the standard employed, the inerts should be as low as is practicable.

Gas engineers—after they have satisfied themselves that continuity of supply is assured—will still require that the gas bought shall be to as close a specification as they themselves adhere. The calorific value of the gas shall not vary more than prescribed limits. The specific gravity (total inerts) shall be constant. The H_2S in unpurified gas shall not exceed a given limit. This last should not be difficult to attain, as crude coke-oven gas usually contains less H_2S than gasworks crude gas. The gas must be low in temperature, leaving the coke oven works, and therefore free from moisture.

One subject which has been occupying the attention of those interested in gas manufacture has been the proposition of removing the moisture from gas prior to its distribution. When gas stored over water in holders is subsequently cooled in the mains condensation takes place. This involves great expense in the installation and maintenance of syphons, and causes irregularities in supply and corrosion of mains, meters, and services. The necessity of the use of cast-iron mains for the distribution of gas is mainly due to the internal corrosion caused by the presence of the water, and with dry gas these mains might be replaced with steel mains. In addition to this, moisture is of no value, but costs a considerable amount to distribute. 1,000,000 cb. ft. of gas, saturated at 70° C. contains nearly 25,000 cb. ft. of water vapour.

There are various methods of treating gas for the removal of water, amongst which may be mentioned compression, refrigeration, treatment by hygroscopic substances, and treatment by adsorbents. Treatment by means of refrigeration may conveniently be carried out by bringing cooled water into intimate contact with the gas. One firm associated particularly with air conditioning, the Carrier Engineering Company, has devised an apparatus for gas cooling along these lines. For small works ammonia or carbon dioxide refrigeration would probably be the best, but in large plants the centrifugal type of refrigerating system would appear to be the most convenient. The method of dehydration by means of refrigeration has the advantage that the cooling of the gas also removes naphthalene and tar fog from the gas. Gas subjected to this treatment would therefore not require any special naphthalene washing plant.

An interesting suggestion for dehydrating by means of sulphuric acid has been put forward by the Koppers Company of America, in which the gas is dried by means of sulphuric acid, the diluted sulphuric acid being used on the sulphate of ammonia plant. In this case a catch box must be employed to prevent any possible entrainment of sulphuric acid.

A further scheme for drying gas is by means of silica gel, which has highly absorptive properties as regards moisture.

One of the most important points to consider is the cost of drying gas, and it appears that the process of drying gas would cost somewhere in the neighbourhood of 0.25d. to 0.5d. per 1,000 cb. ft. according to the quantity to be dried.

One of the difficulties to be met is that the gas cooling has to be done on the outlet holder, unless the holder liquid is oil. Cooling on the outlet holder demands the installation of a plant sufficient to cool the maximum hourly output.

Coke ovens must supply gas low in naphthalene. Complete removal is attained in some gas works. Many remove it to as low as 2 grains per 100 cb. ft., and it would be of advantage if all did so. With gas rich in naphthalene there is a tendency for the naphthalene to be deposited in the mains, causing back pressure and blockage. When the gas contains light oils, these act as a solvent for naphthalene, and prevent deposition. Naphthalene troubles become a matter of first importance when considering the bulk distribution of coke-oven gas. Any blockage of the main increases the power costs of distribution, and is difficult to locate. It is therefore essential that gas to be delivered for town's purposes by coke-oven plants should have a low naphthalene content. To maintain the steady low naphthalene content demands gas washing.

When benzole is recovered by means of wash oil this at the same time involves a satisfactory removal of naphthalene, as long as certain conditions are watched. When benzole is being washed out by means of a creosote oil, it is possible for the creosote oil to increase rather than reduce the naphthalene in the gas.

The following table shows the maximum temperature which must be employed to obtain a gas of desired naphthalene content when using a wash oil with varying degrees of saturation with naphthalene. Thus, using a wash oil saturated to the extent of 15% with naphthalene, if a gas containing four grains of naphthalene per 100 cb. ft. is required, a temperature not exceeding 23° C. must be employed.

Naphthalene removal by creosote

Table showing maximum temperature of wash oil for different degrees of saturation

Grains naphthalene per 100 cb. ft.	° Saturation of oil with naphthalene.				
	5%	10%	15%	20%	25%
2	28° C.	17° C.	6° C.	2° C.	—
4	37	29	23	16	10° C.
6	—	34	29	25	20
8	—	37	33	28	25
10	—	40	35	31	28
12	—	—	37	33	31
14	—	—	39	35	32
16	—	—	—	36	34
18	—	—	—	38	36

The efficiency of naphthalene scrubbers depends upon intimate contact between the gas and the wash liquid. In America the tower type of scrubbers are most favoured. These require small ground space, give very little back pressure, and are simple and cheap to operate.

In the Koppers Company process a maximum oil consumption of 25 gals. per million in summer, 5 gals. per million in winter, will reduce the naphthalene and gum-forming constituents to a trace.

The loss in heating value of the gas is less than half of 1 B.Th.U. per cb. ft. The cost of operation of such a plant is very low.

conclusion was based upon the experimental fact that the compound $\text{PtCl}_2 \cdot 2\text{NH}_3$ exists in two forms, which are regarded as *cis* and *trans* isomerides.

Confirmation has been supplied by the X-ray analysis of $\text{K}_2[\text{PdCl}_4]$ and $\text{K}_2[\text{PtCl}_4]$,⁴² which has revealed a square configuration of the four radicals around the noble metal. On the other hand, the same method has indicated a tetrahedral configuration of four atoms of beryllium round a central atom of oxygen, and of four atoms of oxygen around each of these atoms of beryllium, in basic beryllium acetate,⁴³ $\text{OBe}_4(\text{O}_2\text{C}\cdot\text{CH}_3)_6$, a compound in which an atom of oxygen occupies the centre of a tetrahedron, of which the corners are occupied by four atoms of beryllium, whilst the six acetyl-groups occupy the six edges of the tetrahedron, and serve to bracket together the pairs of beryllium atoms at the corners.

In these conditions it was of special interest to know whether the tetrahedral configuration of a 4-co-ordination compound can be established by the ordinary chemical method, depending on the development of optical activity in a suitable compound of the metal. As in the case of the 6-co-ordination compounds, this can be achieved most readily by making use of bivalent or chelate radicals; but whereas in the 6-co-ordination compounds three *symmetrical* oxalate (or ethylene diamine) radicals can be used, it is essential that the two bivalent radicals of the 4-co-ordination compound should be *unsymmetrical*, since otherwise the resulting model would possess elements of symmetry which would render it incapable of existing in optically-active forms. A clear indication of this tetrahedral configuration was obtained when it was discovered that beryllium benzoylcamphor undergoes mutarotation in solution:⁴⁴

This could be explained most readily by supposing that the beryllium is linked to four oxygen atoms, and that the two possible tetrahedral configurations of these four oxygens are interconvertible, thereby reversing the sign of the rotatory power of the dissymmetric metallic atom. Since, however, the optical activity of the benzoylcamphor could not be eliminated, this explanation remained unproved until Mills and Gotts⁴⁴ succeeded in developing a transient optical rotatory power in the salts of *beryllium-benzoylpyruvic acid*.

This result was not unexpected, since the tetrahedral configuration of the beryllium-complex had already been established in the case of the basic acetate; but an entirely new field is opened up by the fact that similar observations were made with the zinc and copper

derivatives of the acid. These two metals, although normally bivalent, resemble bivalent nickel sufficiently to justify the expectation that they might yield derivatives with an octahedral or square configuration. The fact that their 4-co-ordination compounds can be obtained in dissymmetric forms proves that in these compounds at least the configuration is tetrahedral and not planar.

NOTES FROM GERMANY

Sodium Sulphide Convention in Germany

A price convention for sodium sulphide has been formed in Germany by the I.-G. Rhenania Kuhlheim, Verein. Chem. Fabriken, Goldschmidt A.-G., Roos & Co, and Concordia companies.

German Fertiliser Industry

According to a preliminary estimate, the consumption of fertilisers in Germany during the year ended April 30, 1926, amounted to 330,000 metric tons of nitrogen, 368,000 tons of phosphoric acid (P_2O_5), and 609,000 tons of potash (K_2O), figures which compare with 335,000 tons, 370,000 tons, and 664,000 tons in 1924-1925, and 210,000 tons, 630,000 tons, and 557,356 tons in 1913-14, when the territory was some 5 million hectares larger.

The German output of fixed nitrogen during the fertiliser year 1926-27 is estimated at 600,000 tons. The consumption of phosphates is about 59% of the pre-war consumption of 634,000 tons in 1912-13, and as the production is some 600,000 tons, or about 35% of its pre-war output, the leading producers have formed a cartel, the "Deutsche Superphosphat Industrie G.m.b.H." One reason for this decline is the increasing use of basic slag, although the production is only about 1,000,000 tons, compared with 2,200,000 before the war. Concentration for mass and cheaper production is being effected in the potash industry, and sales in 1926 are expected to amount to 1,100,000 tons K_2O , which is roughly equal to sales in 1913. The potash syndicate is divided by two associations of concerns, each said to be primarily interested in obtaining control of the syndicate: the Salzdetfurth group, controlling 52.1% of the total German output of potash, and the Wintershall group, controlling 39%.—(U.S. Comm. Rep. 48, 1926).

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

ANNUAL GENERAL MEETING,

July 4 to 8, 1927

A preliminary programme of the annual meetings to be held in Edinburgh appeared on p. 81 of the issue of *CHEMISTRY AND INDUSTRY* for last week, and further information will be published from time to time.

Meantime, in view of the great demand for accommodation during the week of the meetings that the Edinburgh hotels are already experiencing, it is thought desirable to give now the names and addresses of the chief hotels in the city, with their tariffs, in order that members of the Society and others intending to be present at the meetings may book their accommodation *without delay* :—

HOTELS

Caledonian Station Hotel, Princes Street :	
Bed and breakfast	14s. 6d.
Bruid Hills Hotel : Bed and breakfast ...	14s. 0d.
Roxburghe Hotel, 38, Charlotte Square :	
Single room with bath and breakfast ...	13s. 0d.
Double rooms from	11s. 6d.
Royal British Hotel, 12, Princes Street :	
Bed and breakfast	11s. 6d. to 13s. 6d.
Queen Hotel, 1 and 2, St. Colme Street :	
Bed and breakfast	8s. 6d. to 12s. 6d.
George Hotel, George Street : Bedroom, bath and breakfast	10s. 6d.
County and West End Hotel, 19, Lothian Road : Double rooms only. Bed and breakfast	8s. 6d.
Palace Hotel, 1, South Castle Street : Bed and breakfast from	8s. 6d.

Temperance Hotels

Darling's Regent Hotel, 21, Waterloo Place :	
Single bedroom and breakfast	10s. 0d.
Double bedroom and breakfast	8s. 6d. to 10s.
St. Andrew Hotel, 10, South St. Andrew Street :	
Double bedrooms only	8s. 6d. to 10s. 6d.
Cockburn Hotel, Cockburn Street : Bed and breakfast from	8s. 6d.
Maitland Hotel, Shandwick Place : Bed and breakfast	8s. 6d.

Private Hotels

Mrs. Craw, 32, Abercromby Place : Bed, bath, and breakfast	10s. 6d.
Grosvenor Hotel, 17 and 19, Grosvenor Street : Bed and breakfast	9s. 6d.

UNIVERSITY HOSTELS

Masson Hall, 31, George Square : Single bedrooms (men or women). Bed and breakfast	8s. 0d.
Students' Hostel, East Suffolk Road : Single bedrooms (men only). Bed and breakfast	8s. 0d.

Those who decide to stay at the North British Station Hotel (official Headquarters of the Society during the meetings) or at one or other of the University Hostels are requested to arrange *at once* their accommodation through the Hon. Local Secretary of the Society, Dr. W. T. H. Williamson, 13, George Square, Edinburgh.

Accommodation to be reserved at any of the other hotels should be arranged direct with the Manager of the hotel.

TAR CONFERENCE PAPERS

The papers that were presented before the Manchester Tar Conference in November last have now been published in bound form at the price of 2s. 6d., post free.

Copies can be obtained from the General Secretary of the Society of Chemical Industry, Central House, Finsbury Square, London, E.C.2, and orders should be accompanied by the appropriate remittance.

CALENDAR OF FORTHCOMING EVENTS

- Feb. 7. SOCIETY OF ENGINEERS. Inaugural Meeting for the year 1927. Apartments of the Geological Society, Burlington House, W.1, at 5.30 p.m. Presidential address by D. C. Fidler. Presentation of premiums awarded in 1926 by the retiring President, G. O. Case.
- Feb. 7. INSTITUTION OF THE RUBBER INDUSTRY, *London and District Section*, Engineers' Club, Coventry Street, W.1, at 8 p.m. (1) "Set in vulcanised rubber," by H. Turner. (2) "Rubber toys," by H. Standing.
- Feb. 7. BIOCHEMICAL SOCIETY, *Lister Institute of Preventive Medicine*, Chelsea Bridge Road, S.W.1, at 5 p.m. (1) "A new type of alkali lignin," by C. Dorée and E. C. Barton-Wright. (2) "Observations on the purification and properties of insulin," by F. Dickens, E. C. Dodds, W. Lawson, and N. F. MacLagan. (3) "The significance of phosphoric acid in muscular contraction," by P. Eggleton and M. G. Eggleton. (4) "The lipins of yeast," by I. Smedley MacLean and C. G. Daubney. (5) "Methylated derivatives of hexosephosphoric acids," by W. T. J. Morgan. (6) "Meyerhof's theory of alcoholic fermentation," by A. Harden. (7) "Proteins of the cerebro-spinal fluid," by L. F. Hewitt. (8) "Nitrogen metabolism technique for use with small animals," by M. H. Roscoe. (9) "An efficient gas scrubber," by H. W. Southgate. (10) "On the nature of provitamin D," by O. Rosenheim and T. A. Webster. (11) "The effect of the reaction on the osmotic pressure of serum proteins," by J. R. Marrack.
- Feb. 7. SOCIETY OF CHEMICAL INDUSTRY, *London Section*, Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. "Photographic sensitivity," by Dr. T. Slater Price.
- Feb. 8. SOCIETY OF CHEMICAL INDUSTRY, *South Wales Section*, Technical College, Cathays Park, Cardiff, at 7.30 p.m. "Micro-organisms of the soil," by Prof. J. Mangan.
- Feb. 8. SOCIETY OF CHEMICAL INDUSTRY, *Birmingham and Midland Section*, University Buildings, Edmund Street, Birmingham, at 7.15 p.m. "Metallurgical spectroscopic analysis," by F. Twyman.
- Feb. 8. INSTITUTION OF PETROLEUM TECHNOLOGISTS. Rooms of the Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m. "The production of oil from coal: an account of the work of the Fuel Research Station," by Dr. C. H. Lander.
- Feb. 9. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. (Ordinary Meeting). "The romance of the organic chemical industry," by Dr. E. F. Armstrong. Mr. A. Chaston Chapman will preside.

- Feb. 10. INSTITUTION OF THE RUBBER INDUSTRY, *Manchester and District Section*. The Textile Institute, 16, St. Mary's Parsonage, Manchester, at 7.30 p.m. "Proofing," by J. Lloyd.
- Feb. 10. INSTITUTE OF BREWING, *North of England Section*. Midland Hotel, Manchester. "Recent work on the preservative principles of hops," by Prof. F. L. Pyman.
- Feb. 10. OPTICAL SOCIETY. Annual General Meeting.
- Feb. 10. INSTITUTION OF MECHANICAL ENGINEERS. Leeds Meeting. "Use and economy of high pressures in steam plant," by Profs. A. L. Mellanby and W. Kerr.
- Feb. 10. INSTITUTION OF ELECTRICAL ENGINEERS. Annual Dinner and Reunion. Hotel Cecil, Strand, W.C., at 7.15 for 7.45 p.m. H.R.H. the Prince of Wales, K.G., will be present.
- Feb. 10. CHEMICAL SOCIETY. A Memorial Lecture in honour of the late Kamerlingh Onnes will be delivered by Prof. Dr. E. Colien (of Utrecht), at the Institution of Mechanical Engineers, Storey's Gate, Westminster, S.W. 1, at 8 p.m.
- Feb. 10. ELECTROPLATERS' AND DEPOSITORS' TECHNICAL SOCIETY. Joint Meeting with the London Section of the Institute of Metals, Rooms of the Society of Motor Manufacturers and Traders, Ltd., 83, Pall Mall, at 7.30 p.m. "Nickel coatings and methods of production," by W. R. Barclay.
- Feb. 11. CHEMICAL ENGINEERING GROUP. The Meeting arranged for this date has been postponed.
- Feb. 11. WEST OF SCOTLAND IRON AND STEEL INSTITUTE. "Silica brick," by A. H. Middleton.
- Feb. 11. GLASGOW UNIVERSITY ALCHEMISTS' CLUB. Annual Dance at 7.30 p.m.
- Feb. 11. INSTITUTE OF METALS, *Sheffield Local Section*. The University, St. George's Square, Sheffield, at 7.30 p.m. "Bronze," by R. T. Rolfe.
- Feb. 11. INSTITUTE OF METALS, *Swansea Local Section*. University College, Singleton Park, Swansea, at 7.15 p.m. "The design of annealing furnaces," by J. S. Caswell.
- Feb. 14. INSTITUTE OF CHEMISTRY, *Manchester and District Section*. "Electronic theories of valency in organic chemistry," by Prof. R. Robinson.
- Feb. 14. SOCIETY OF CHEMICAL INDUSTRY AND THE INSTITUTE OF CHEMISTRY. *Joint meeting of the Edinburgh and East of Scotland Sections*. The Pharmaceutical Hall, 36, York Place, Edinburgh, at 8 p.m. "The use of the microscope in qualitative analysis," by B. D. W. Luff.
- Mar. 9 and 10. INSTITUTE OF METALS. Annual General Meeting. The Hall of the Institution of Mechanical Engineers, Storey's Gate, Westminster, S.W. 1. On March 9, at 10 a.m. General Meeting. Papers as follows: (1) "Investigation of the effects of impurities on copper. Part V.—The effect of bismuth on copper," by Prof. D. Hanson and Grace W. Ford. (2) "Investigation of the effects of impurities on copper. Part III.—The effect of arsenic on copper. Part IV.—The effect of arsenic plus oxygen on copper," by Prof. D. Hanson and C. B. Marryat. (3) "Brittleness in arsenical copper," by C. Blazey. At 2 p.m.

"Electric furnaces in non-ferrous metallurgy," by D. F. Campbell, followed by a general discussion on "Electric furnaces in non-ferrous metallurgy." At 6.45 p.m. Annual Dinner and Dance at the Trocadero Restaurant, Piccadilly Circus, W. 1. On March 10 at 10 a.m. the meeting will be resumed and the following papers read: "The penetration of mild steel by brazing solder and other metals," by R. Genders. "The penetration of brass by tin and solder, with a few notes on the copper-tin equilibrium diagram," by J. H. Miller. "The attack of molten metals on certain non-ferrous metals and alloys," by H. J. Hartley. "Notes on the manufacture and properties of hair springs," by H. Moore and S. Beckinsale. "The application of strain methods to the investigation of the structure of eutectic alloys," and "Note on the crystallisation of the lead-tin eutectic," by F. Hargreaves. Discussion will follow. At 2 p.m. the following papers will be read and discussed: "The influence of calcium on aluminium containing silicon." With an appendix on "The estimation of calcium in aluminium alloys," by P. G. Ward. "The magnesium-rich magnesium-copper alloys," by M. Hansen. "The mechanism of inverse segregation in alloys," with an appendix on "The accurate determination of copper in bronze by electrolysis," by R. A. F. Hammond. "Magnetic analysis as a means of studying the structure of non-magnetic alloys," by Prof. K. Honda and Prof. E. Hikoze. "An etching reagent for copper," by Prof. B. W. Holman. "Examination of a fifteenth-century brass," and "Note on the silver contents of Roman lead from Folkestone and Richborough Castle," by J. N. Friend and W. E. Thorneycroft.

GLASGOW UNIVERSITY ALCHEMISTS' CLUB

A meeting, to which the members of the local sections of the Society of Chemical Industry and the Institute of Chemistry had been invited, was held on January 26, when Sir James Walker, F.R.S., delivered an address, entitled "Electrosyntheses," the President, Dr. T. S. Stevens, occupying the chair.

About the year 1850, Kolbe showed that, by the application of electricity, it was possible to prepare ethane from sodium acetate, and it had been found that this method was suitable for synthesising normal hydrocarbons of high molecular weight.

Sir James reviewed the early research, and indicated that, while aliphatic compounds had been successfully synthesised, the method was not applicable to the aromatic series.

It was noteworthy that the electrode influenced the nature of the products—a gold electrode giving entirely different results from a platinum one, even although the conditions of experiment were otherwise constant. He outlined the two theories proposed to account for the reactions, namely, (1) the union of discharged ions, and (2) the oxidation hypothesis—commenting particularly upon Fichter's recent work.

The importance of the physico-chemical aspect was stressed, and an account of recent investigations along such lines was given.

CORRESPONDENCE

THE TESTING OF DISINFECTANTS

SIR,—Referring to Mr. C. T. Kingzett's letter in your issue of 21st January, I was aware of the published papers by Messrs. Kingzett & Woodcock, but I could not see at the time, nor can I yet, that their work had any direct bearing on the main point of my paper, viz., the effect of slight variations in the method of standardising Rideal Walker broth on the phenol coefficient values of coal-tar disinfectants. It should be evident from the paper that only coal-tar disinfectants were under examination, and no attempt was made to discuss the value of the Rideal Walker generally, or the values of other types of disinfectants, such as are referred to by Mr. Kingzett.

Yours faithfully,

QUINTIN MOORE, JNR

Technical Chemistry Department,
The Royal Technical College, Glasgow.

THE MANUFACTURE OF WHITE SUGAR

SIR,—(1) In the paper by Dr. C. A. Browne entitled "The sugar industry in its chemical aspects," published in the JOURNAL of January 14, 1927, attention should be drawn to a seriously inaccurate statement. Dr. Browne (page 29) says that:—

"No plantation has yet found it possible to manufacture white sugar equal in purity and uniformity of grade to refined sugars."

This statement is not correct.

(2) Standard refined granulated sugar, equal in all respects to the product of the large bone-char refineries, is being manufactured on cane sugar plantations in Louisiana, Natal and Porto Rico. The sugar is refined at the raw sugar factory by means of the activated vegetable carbon—Suchar.

(3) The brokers in New Orleans and New York handling this refined sugar report that it fully meets the demands of the most exacting consumers as regards colour, purity and uniformity.

(4) We shall be grateful if you will publish this correction in order that your readers may not be misinformed.

Yours faithfully,

for BRITISH SUGAR PROCESSES, LTD.,

R. G. W. FARNELL,

21, Old Broad Street,
London, E.C.2.

Director

PERSONAL AND OTHER ITEMS

Sir Alfred and Lady Mond have returned to London from the South of France.

Amongst the names of new vice-presidents of the Federation of British Industries put forward for election is Sir William Clare Lees, of the Bleachers' Association, Ltd.

Mr. B. D. W. Luff has resigned his post as research chemist with the North British Rubber Company to become the manager of the analytical laboratories of Lever Brothers, Ltd., at Port Sunlight.

The degree of D.Sc. in chemistry of the University of London has been conferred upon Mr. J. W. Cook, Mr. S. B. Dutt, and Mr. W. G. Shilling.

Mr. A. P. Davson, of Ealing, public analyst for Northampton, has, in addition, been appointed public analyst for Bermondsey, in place of the late Mr. R. Bodmer.

Dr. G. D. Rosengarten, vice-president of Powers-Weightman-Rosengarten, Inc., Philadelphia, has been elected to the presidency of the American Chemical Society.

Mr. John A. Benn, a grandson of the late Sir John Benn, has been appointed a director of Benn Brothers Ltd.

The "Horace Brown Memorial Lecture" will be delivered in the Lecture Theatre of the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W.C.2, at 8.15 p.m. on February 25, by Professor Henry Edward Armstrong, D.Sc., LL.D., F.R.S., to whom the "Horace Brown Medal" will be presented during the course of the evening.

As the Imperial College of Tropical Agriculture has received a Royal Charter of Incorporation, the former company bearing the same title has been dissolved. The activities of the College continue, as before, in Trinidad, but on a larger scale.

Lead mines at Greenhow, near Harrogate, have been reopened after being closed for 60 years. In addition to lead, various mineral by-products are obtained.

One man was killed and two others seriously injured by an explosion which occurred in a still house at the Hendon chemical works of Johnson & Sons on January 31.

The death is announced from Persia of Mr. H. E. Nichols, a director of the Anglo-Persian Oil Company and head of the production department of the company.

The death is announced of Dr. W. W. Seton, secretary of University College, London, who was associated with Sir Gregory Foster in the development of the Department of Chemical Engineering in University College, and the other activities connected with the Ramsay Memorial Fund, of which he was secretary.

Professor Carl Graebe, who died recently at the age of 86, will be remembered for his work on the relation between colour and chemical constitution and for his fundamental work on the constitution of quinone (*p*-benzoquinone), which led to his synthesis (together with Carl Liebermann) of alizarin. The process, though of great interest, was not of commercial value.

Carbonisation Congress

The Congress which it was proposed to hold during March this year under the joint auspices of the Institution of Gas Engineers, the Coke Oven Managers' Association, and the Fuel Section of the Society of Chemical Industry, has been postponed until October owing to the number of other important meetings that are being held during the spring. Very shortly the programme of the Congress will be issued, together with other details.

The Patent Fuel Industry

The patent fuel industry of the United Kingdom, which is centred mainly in South Wales, has a productive capacity of over 2,500,000 tons per annum. Since 1920, however, production has not exceeded 50 per cent. of capacity, and in 1926, owing to the shortage of small coal and of pitch, the output, it is estimated, was only about 800,000 tons, whilst exports were about 500,000 tons, compared with 1,200,000 tons in 1925. The consumption of pitch by the industry constitutes between 8 and 9% of the total output of patent fuel.

British Trade in Dyes

Exports of dyes from Great Britain during the first 11 months of 1926 amounted to 3552 tons (£570,812), compared with 4984 tons (£803,083) during the corresponding period of 1925. This decrease was due largely to the coal stoppage, whilst the unsettled state of China led to reduced exports of synthetic indigo.

Imports of dyes during the same period of 1926 amounted to 1745 tons (£797,282), as against 1823 tons (£579,546) during the corresponding period of 1925, whilst imports of intermediates fell from 54 tons (£11,482) to 15 tons (£3548).

Anodic Oxidation of Aluminium

The striking resistance of aluminium to corrosion by industrial waters and sea-water is ascribed to the presence of a protective film of aluminium oxide or hydroxide. This observation suggested that the resistance of aluminium to corrosion might be greatly increased if a strong and tightly adherent film of oxide or hydroxide were formed on the metal instead of the thin film ordinarily present. As an outcome of investigations carried out on behalf of the Department of Scientific and Industrial Research by the Corrosion Research Committee of the Institute of Metals, a method has been developed of protecting aluminium or its alloys by anodic oxidation. The work, carried out by Dr. G. D. Bengough and Mr. J. M. Stuart, is described in a report on anodic oxidation published by the Department (H.M. Stationery Office, price 1s. 3d.), which gives a full account of the application of the process and large-scale experiments with it at Farnborough. The cost of treatment in an experimental plant was 1.93d. per sq. ft. (largely for labour), the coating obtained being glassy, adherent, and giving greater resistance to corrosion, which, it was found, was further improved by treatment with lanoline. At present the process is not applicable to all aluminium casting alloys. Anodically-treated sheets were found to absorb various dyes.

Tests on the Freeman Multiple Retort

The Department of Scientific and Industrial Research has published a Report by the Director of Fuel Research (H.M. Stationery Office, price 1s.) of tests carried out on the Freeman multiple retort of the British Oil and Fuel Conservation, Ltd., of Willesden, under the scheme by which the Department tests plants for the low-temperature carbonisation of bituminous coal. The plant consists of an externally heated, vertical continuous retort, built up of six cylindrical chambers, placed in vertical alignment, and provided with a central shaft fitted with ploughs to turn over the coal during carbonisation. A description of the retort and of the results

obtained are given in the report. It is concluded that the retort carbonises a weakly caking coal satisfactorily, and gives a higher yield of tar than has been obtained from any other plant using similar coals which has been tested by the Fuel Research staff. The coke produced was highly combustible, but small in size, and would have to be briquetted for domestic use, or used as a pulverised fuel. It was not possible, owing to lack of time, to determine how far a more strongly caking coal could be used.

International Superphosphate Producers' Association

Considerable interest is taken in the United States in the recent formation, at a meeting in London, of the International Superphosphate Producers' Association by representatives of the industry from Great Britain, Belgium, Denmark, Czechoslovakia, Germany, Norway, Sweden, Poland, Finland, French North Africa, and the Union of South Africa. A resolution is to be moved at a forthcoming meeting of the National Fertilizer Association (U.S.A.) with the object of joining the international organisation.

The president of the International Association is Mr. Martens, and its headquarters are in London. The object of the organisation is to exchange information, sales propaganda, and technical collaboration, and to study all matters connected with phosphoric acid and superphosphates.

Modern Developments in regard to Fuel

In view of the great importance of the fuel problem at present, the Governors of the Sir John Cass Technical Institute have arranged a special course of lectures on "Modern developments in regard to fuel," which will deal with some of the technical aspects of the subject. The course will consist of seven lectures of an advanced character given on Monday evenings from 6—7 p.m., commencing on February 7, as follows:—"Recent developments in coal mining," by H. M. Morgans; "Preparation of fuel," by Prof. K. N. Moss; "Pulverised and colloidal fuel," by L. C. Harvey; "Coke oven practice," by E. M. Myers; "Gas works practice," by H. G. Colman; "Low-temperature carbonisation," by F. S. Sinnatt; and "Liquid fuel," by Prof. J. S. S. Brame. The fee for the course of seven lectures is 10s.

"Vegetable Wool" as an Industry for Quebec

An official communication points out the favourable situation of Quebec for the establishment of a new industry—the manufacture of "vegetable wool" from pine needles, from which the fibre is separated by a chemical treatment. The resulting fibre is said to resemble natural wool closely, and can be worked in a similar manner. Waste from the process is used to make briquettes which have proved an excellent fuel, and resin is recovered which also finds a use. Quebec has to import all its coal, so the briquettes would find a ready market, whilst the Province contains well-nigh inexhaustible supplies of the raw material.

Canadian Research in Pulp and Paper

At the annual meeting in Montreal of the Canadian Pulp and Paper Association a proposal to endow a research laboratory in the University of McGill at a cost of \$250,000 (£50,000) was unanimously approved.

The Action of Acid on Leather

At a recent conference of the Advisory Committee for the leather industry of the United States with experts of the U.S. Bureau of Standards, the action of acid on leather was discussed at length. In view of the importance of the problem, it was decided to begin investigation by a study of the effects of sulphuric acid on leathers tanned with different types of vegetable tanning materials.

U.S. Output of Alcohol

During the year ended June 30, 1926, the output of alcohol in the United States totalled 202,271,670 proof gallons, an increase of 36,106,152 gallons over the previous year. This increase is attributed to the growing use of alcohol for fuel, light and power, and for the manufacture of new products.

United States Imports of German Iron

The Secretary of the U.S. Treasury has imposed a special "anti-dumping" duty on German iron, after an inquiry had shown that German pig-iron was being sold in the United States at less than a fair value.

The New German Fertiliser

It is announced that the new complete fertiliser produced by the I.-G. Farbenindustrie is being marketed by the Stickstoff Syndikat. The fertiliser is sold under the name of "Nitrophoska I.-G." in two forms, one containing a guaranteed minimum of 17% N, 11.7% water-soluble P_2O_5 (as well as 1% citric-soluble P_2O_5) and 21.1% K_2O , and a second containing 14.7% N, 10.2% water-soluble P_2O_5 (plus 0.09% citric-soluble P_2O_5) and 25.6% K_2O . The nitrogen is present as to one-third combined as nitrate with the potash and as to two-thirds as ammonia combined with P_2O_5 . The product is neutral, easily soluble, whitish-grey in colour, and contains nothing injurious to plant life. It is prepared in the form of small grains to facilitate distribution. The fertiliser factory of the I.-G. can turn out 120,000 metric tons a year with its present equipment.

The Fixed-Nitrogen Industry

At a recent meeting of the Wintershall Konzern it was stated that the company had acquired the rights to patents covering the nitrogen-fixation processes of a Swedish concern. If expectations are not realised within two years the contract will be cancelled.

The operation of the Mont Cenis process by the Gewerkschaft der Steinkohlenzeche Mont Cenis, at Solingen, is reported to be running smoothly. A maximum daily production of 4.2 tons has been attained, but the limiting factor has been the capacity of the Messerschmidt hydrogen plant. It is quite likely that production will be doubled as soon as the installation of a Linde unit for separating hydrogen from coke oven gases is completed. The Mont Cenis process is based on the employment of a catalyst, which, it is claimed, permits operation with much lower pressure than was formerly considered necessary. The operating expenses are said to be less than those of other methods which are based on reactions under high pressure and temperature. The Mont Cenis company is primarily a coal-mining enterprise, with a daily output of 3000 to 4000 tons. About one-third of the output is coked, and the company desires to utilise more fully its coke oven gases.

REVIEWS

CHEMISTRY OF THE PROTEINS AND ITS ECONOMIC APPLICATIONS. By DOROTHY JORDON LLOYD, M.A., D.Sc. Pp. xii+269. London: J. and A. Churchill, 1926. Price 10s. 6d.

Dr. Lloyd is to be congratulated upon her volume on the Chemistry of the Proteins, which is a decidedly useful contribution to this class of literature.

The book is divided into two parts, the first of which (114 pages) deals with the analysis, composition and classification of these bodies, whilst the second part (152 pages) discusses especially their physical-chemical properties.

Miss Lloyd's purpose has been to provide a concise record in the English language of the position of protein chemistry as it has been affected by the developments of the last few years. The book shows quite clearly that the task has been very conscientiously performed, for it gives evidence, not only of the author's unusually thorough acquaintance with the enormous literature on this subject, but also of her intimate knowledge of the most recent contributions. Indeed, the frequency of her references throughout the whole book to papers of 1922-25 places such an emphasis upon recent work that the reader cannot help feeling that the author is personally in touch with a live and rapidly developing subject. On the other hand, this emphasis has the effect of ascribing too great a relative value to some of the recent contributions.

The scope of the book is ambitious, especially for such a small volume, but one of its best features is the valiant attempt to preserve a balance between the many aspects of the proteins. The chemistry of foodstuff proteins is one of the chief considerations, perhaps rightly so, but the proteins of the wool, silk, adhesive and leather industries are dealt with in outline. Both from the standpoint of pure and applied chemistry the author correctly recognises that "the literature is so vast that completeness is impossible."

The first part of the book is undeniably good. Criticism might be levelled at the classification of the proteins, but as any other classification would equally invite similar criticism, one cannot blame a biochemist for emphasising the broad association of protein behaviour with biological origin and function. The so-called "chemical classification" of the physiologist is also submitted and discussed, as well as the undoubted need for its revision. In a small book summarising a big subject it would be unfair to saddle the author with the onus for the nomenclature of the proteins. One of the most unfortunate features of protein chemistry has been the invention of names which cover a mixture of protein degradation products, but which apparently indicate a definite substance or a group of similar substances. Possibly the author is open to criticism that some of these unfortunate cases have been passed on to new readers, but such criticism is only sound if the designations have been clearly shown to be nonsensical. In making the "histones" co-ordinate with the "albumins" Dr. Lloyd is guilty of such a mistake.

The physical chemistry of the proteins discussed in Part II of the book is a reasoned account of various

modern and divergent views, with possibly a little natural emphasis upon those view points which approximate to the author's own opinions. Little criticism is attempted in this part of the book, but the author has had the commendable courage to state on various points "this is not yet understood."

The most disappointing feature of this section is that the following sentence (p. 157) should occur, and be italicised, but should be insufficiently discussed and developed: "The tendency to form molecular aggregates associated with the solvent is characteristic of the proteins as a class." There is little doubt that in this sentence Miss Lloyd has emphasised the best clue in regard to the correct understanding of the physical chemistry of the proteins, but has not only failed to follow up the clue herself, but in subsequent chapters has failed also to point out that many other workers, such as Procter, Wilson and Loeb, have missed this clue completely, and so impaired the value of much of their work. The book correctly castigates the absurd word "peptisation," but does not adopt any alternative term, such as "solation." The sol-gel transformation, indeed, could with value be more fully discussed.

On the whole the book is excellently paragraphed, the literary style is much better than is usual in such books; there is also a very commendable freedom from mistakes, indicating careful proof revision. There are also useful bibliographies attached to each chapter. The subject index could be extended with advantage, but probably the worst feature of the book is its full title, which is unnecessarily cumbersome and grammatically doubtful.

H. G. B.

CHEMISCHE BODENANALYSE. METHODEN UND ANLEITUNG ZUR UNTERSUCHUNG VON BODEN IM LABORATORIUM. By K. K. Gedroiz. Translated from the Russian by Dr. L. Frey. Pp. xii + 245. Berlin: Gebrüder Borntraeger, 1926. Price 12 m.

Those who have been following the advances in soil chemistry made by the author will welcome the appearance of this volume, which deals comprehensively with methods of soil analysis.

The sections describing the recent methods of investigating the easily replaceable bases, the capacity of absorption, and the degree of unsaturation of soils are particularly interesting because of the pioneer work of Gedroiz on these subjects. Although some of the methods may not yet be wholly satisfactory, this branch of soil investigation promises to yield important results, and it is very useful to have a set of methods collected in a text-book. Gedroiz recognises the importance of employing simple and rapid methods in soil work, and deals at some length with colorimetric methods, giving at the end a summary of the literature on this subject.

Other important sections of the work deal with the ultimate analysis, the soil solution, the water extract, and the methods of determining lime requirement. The final chapter describes the preparation of the principal reagents required.

The book is well arranged and very completely indexed. It is to be regretted that there is no English translation.

W. G. Ogg

COMPANY NEWS

GAS LIGHT AND COKE CO., LTD.

The gross revenue for the year 1926 amounted to £12,548,619 (£9,569,292 for 1925), and after meeting all expenses the net revenue was £1,337,846, compared with £1,262,059. The cost of coal during the year amounted to £3,923,981, as against £2,973,034. An increase of nearly 2½% in the sales of gas is recorded for 1926, the number of consumers increasing by 24,699 and the number of gas stoves sold and let out on hire by 112,732. For the first three months of the year the price of gas was 9·4d. per therm, which, owing to the high cost of foreign coal during the strike, was raised to 9·6d. per therm as from September quarter, to 10·6d. as from October, and to 11·6d. as from December. In March the price will be reduced by 1·4d. per therm.

SOUTH METROPOLITAN GAS CO., LTD.

Subject to audit, a dividend has been recommended for 1926 of 6%, less the interim dividend of 2½% paid in September last, being the same as for 1925.

MOND NICKEL CO., LTD.

An interim dividend has been declared for the year ending April 30, 1927, of 5% on the ordinary shares, payable on March 1. A similar interim was paid for each of the three preceding years.

W. J. BUSH AND CO., LTD.

An interim dividend has been paid of 3% on the ordinary shares, being the same as last year's interim.

COURTAULDS, LTD.

This company announces that it has concluded an arrangement with the Vereinigte Glanzstoff-Fabriken A.G. of Elberfeld and the Snia Viscosa Co. of Turin for the purpose of bringing about commercial and technical collaboration between the three companies. This arrangement is in the nature of an international artificial silk cartel, as all three companies are the biggest operating in their respective countries. The capital of the three companies totals about £30,280,000, the capital of Courtaulds being £20,000,000. According to the *Financial Times*, it is generally conceded in Milan that the Snia Viscosa Co. will stand to benefit by the arrangement more than the other two companies, as it is not so far advanced in development, and it will now receive the full assistance of the British and German concerns. The three companies will each concentrate on those qualities with which they are best equipped to deal. The Snia Viscosa Co. has still to complete its works to bring the output up to 100,000 kg. daily, and a special arrangement has been made permitting it to finance itself in Great Britain for an amount which, it is believed, is fixed around £2,500,000, the proceeds to be applied to the completion of the plant and certain important technical transformations rendered necessary by the new processes and patents which will be available.

NON-INFLAMMABLE FILM CO., LTD.

This company has a capital of £550,000, divided into 500,000 ordinary shares of £1 each and 1,000,000 deferred shares of 1s. each. The company is to acquire the sole

rights throughout the British Empire (with the exception of Canada) in processes for the manufacture of cellulose acetate and the conversion thereof into non-inflammable film suitable for cinemas, splinterless glass, and many other purposes. The company has contracted to sell its entire output of positive cinema film for the next seven years (exclusive of Government requirements), and on the basis of an output of 250,000,000 ft. under this contract, of 125,000,000 ft. of other film, in addition to special film for splinterless glass, etc., the profits are estimated at £207,500 per annum. The purchase price for the rights and other assets is £45,000 in 1s. deferred shares and £70,000 in cash, and after payment of the latter and allowing £225,000 for contemplated extensions, additions, etc., and paying all preliminary and formation expenses, there will be a working capital of not less than £150,000. The directors are Sir Herbert E. Blain, Kt., (C.B.E., M.Inst.T. (chairman), H. Levinstein, M.Sc., F.I.C. (deputy chairman), Sir John W. Courtis, Kt., J.P., Mr. D. MacCallum, J.P., Mr. E. W. Mann, Sir John de Fonblanque Pennesfather, Bart., J.P., M.P., and Mr. T. S. Stewart-Smith. The consulting chemist is Dr. Karl Krieser, F.R.P.S., late of the Bayer Company, and the technical management is under Mr. H. J. Mallabar, F.R.P.S., inventor of the non-inflammable film, and Dr. F. Westhoff, lately chemist of the Nobel Film Co. The secretary is Mr. J. E. M. Maw, and the registered office is at 3, Regent Street, S.W.1.

MIDLAND BANK, LTD.

The Ordinary General Meeting was held on January 28. The Chairman, the Right Hon. R. McKenna, said he proposed to give some answer, partial though it may be, to the question: Why is it that for the past six years we have suffered from trade depression and unemployment of almost unparalleled severity, while America has enjoyed great and increasing prosperity? In the present case he could not escape the conclusion that the monetary element had been of deep importance.

Since the autumn of 1921 there had been a great expansion in bank deposits in the United States. The average total deposits of the reporting member banks of the Federal Reserve system rose from £2,860 millions for the twelve months ending November, 1922, to £3,751 millions for 1926. Over the same period the total deposits of the ten London clearing banks fell from £1,783 millions to £1,661 millions. Those who think that any increase in the volume of money must be stigmatised as inflation would doubtless be alarmed by this growth of credit in the United States; but if the supply of new money did no more than keep pace with the increase in production, there was, in fact, no inflation. We had to distinguish clearly between inflationary and non-inflationary growth in the volume of credit, and to do so we must start with the question of how additional money comes into being. Apart from the action of a bank, the public in practice was powerless to increase or diminish permanently the total of money except by destroying their notes or sending them out of the country. The Government, independently of action by the Bank of England, was no less passive than the public. We must therefore look to action by the banks, and particularly the Bank of England as the central institution, for the cause

of these movements. All banks, however, maintain a fairly regular proportion between their cash and deposits, so that if we were to discover the real causes of fluctuation in the quantity of money we must look for them in whatever produces variation in the total of bank cash, which means currency holdings together with balances at the Bank of England.

It was not generally recognised that the principal cause of any but the most transient movements was not something done by the banks, but something done by the Bank of England. If the Bank of England makes a loan, or discounts bills, or buys gold or securities, the amount paid becomes bank cash. Conversely, when a loan by the Bank of England was repaid, or discounted bills were met at maturity, or gold or securities were sold, bank cash was correspondingly diminished. Indirectly, therefore, the Bank of England was in practice the controller of the volume of money. The Bank itself, however, was governed by the terms of its constitution, and even such freedom for the exercise of policy as it might possess was in considerable measure limited by the rigidity of its system. This is the point which he wished to emphasise.

It was accepted as an axiom that an influx of gold into the Bank of England stimulates trade here. The stimulus, however, was due to the additional bank cash which the purchase of gold creates. The effect on the total of bank cash was precisely the same whether the Bank buys gold or bills or War Loan or bricks and mortar, whether it lends to the Government, the Bank of France, or any other of its private customers. When the Bank buys gold, however, its reserve is strengthened and the ratio improved: when it buys anything else the reserve remains unaffected and the ratio declines. It naturally followed that an increase of bank cash which arose from an influx of gold was regarded with equanimity and even satisfaction, whilst a proposal for an increase of bank cash specifically to meet trade needs would not be viewed with the same cordiality.

The American system had been framed to suit modern conditions, and in fixing reserve requirements the development of deposit banking had been duly recognised. On the other hand, the Bank of England operated under the Act of 1844, and as a consequence its reserve was insufficient to permit open market operations with a view to increasing the volume of credit on anything more than quite a small scale. If our central bank were to be re-established on the same reserve basis as either the Federal Reserve Banks or in accordance with any modern system, the Bank of England would have a larger reserve and could work with greater freedom of policy and with manifest advantages to our trade. This subject merited the most disinterested and painstaking investigation. The vital need for the future was to ensure that the maintenance of prosperity, with a growing population and ever-improving standard of living, both requiring an expansion in the volume of trade, shall not be hampered by false restrictions on the quantity of money. We needed careful and expert consideration of the theoretical basis and practical technique of our credit and currency system, including the position of the Bank of England as the custodian of our monetary resources.

[For the accounts, see CHEM. AND IND., Jan. 14, p. 41.]

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton, f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Sal ammoniac.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included. Sod. Chlorate.—2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
 Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
 Arsenic, Sulphide, Yellow.—2s. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 2d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. R.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamylide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 per ton. Scarce. Grey, £17 5s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£8 5s.—£10 per ton and upwards, according to grade and locality. Very scarce and fair demand.
 Iron Liquor.—1s. 6d. per gal. 32° Tw.; 1s. 2d. per gal. 24° Tw.
 Red Liquor.—10d.—11d. 16° Tw. per gal.
 Wood Creosote.—2s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 10d.—4s. per gal., 60% O.P. Solvent, 4s. per gal., 40% O.P.
 Wood Tar.—£4—£5 per ton and upwards, according to grade.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid 'Carbolic.—Crystals, 6½d.—6½d. per lb. Crude 60's, 1s. 8½d.—1s. 9½d. per gal.
 Acid Cresylic, 99/100.—2s. 3d.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 1d. per gal. Pale, 95%, 1s. 10d.—2s. per gal. Dark, 1s. 9d.—1s. 10d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 3d.—1s. 4d. per gal., ex works in tank wagons; Standard motor. 1s. 11d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s. 2d.—2s. 5d. per gal., ex works in tank wagons.
 Tolnole.—90%, 1s. 11½d. to 2s. 4d. per gal. Firm. Pure, 2s. 2½d.—2s. 6d. per gal.
 Xylol.—2s. 3d.—2s. 7d. per gal. Pure, 4s. per gal.
 Creosote.—Cresylic 20/24%.—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal.
 Naphtha.—Crude, 9½d.—1s. 0½d. per gal., according to quality. Solvent 90/160, 2s.—2s. 1d. per gal. Solvent 95/160, 1s. 11d.—2s. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s. per ton.
 Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—110s.—120s. per ton, f.o.b. according to district. Prices nominal.
 Pyridine.—90/140.—9s. 6d.—17s. per gal. Nominal. 90/180.—7s. 6d. per gal. Heavy.—7s.—10s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionip.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—9½d. per lb., naked at works.
 Aniline Salts.—9½d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d.—4½d. per lb.
 m-Cresol 98/100%.—2s. 8½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—7d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 4d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—9d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xylidine Acetate.—2s. 11d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 5d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots—1s. per oz.
 Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 3½d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 5d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 0½d. per lb. Less 5%.
 Amidol.—9s. 6d. per lb. d/d.
 Acetanilide.—1s. 7d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—11s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £30 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Aspirin.—2s. 4d. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzophenanthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.

Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 6d. per lb. Potassium.—2s. 1d. per lb. Sodium.—2s. 4d. per lb. All spot. Market firmer.
 Calcium Lactate.—1s. 5d. per lb.
 Chloral Hydrate.—3s. 3d.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ether meth.—1s. 1d.—1s. 11½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—6s. 6d.—7s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 8d. per gal. f.o.r. makers' works, naked.
 Hydroquinone.—4s. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—22s. per cwt., 112 lb. lots.
 Magnesium Carbonate.—Light Commercial £33 per ton net.
 Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%; Heavy Pure 2s. per lb. in 1 cwt. lots.
 Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 12s.—14s. per lb., according to quantity; 10s. 6d. for 1 cwt. lots and upwards. Liquid (95%), 12s. per lb. Detached cryst., 15s. per lb.
 Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb., Levig. 6s.—6s. 1d. per lb.; Corrosive sublimate, Lump, 4s. 8d.—4s. 10d. per lb., Powder, 4s. 2d.—4s. 3d. per lb.; White precip., Lump, 4s. 10d.—5s. per lb., Powder, 4s. 11d.—5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d. per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide, 5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d. per lb.; Sulph. nig., 4s. 10d.—4s. 11d. per lb.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonol.—15s. 6d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—3s. 9d.—4s. per lb.
 Phenazone.—5s. 9d.—6s. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 85s. per cwt., less 2½% for ton lots. Dearer.
 Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
 Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d. per lb. for 1 cwt. lots.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6½d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d. per oz. for 1,000 oz. lots in 100 oz. tins.
 Resorcin.—4s.—4s. 3d. per lb. spot.
 Saccharin.—55s. per lb.
 Salol.—3s.—3s. 3d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s. per lb. for 1 cwt. lots; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—80s.—85s. per cwt. net, according to quantity.

Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal 1s. 10d.—1s. 11d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton, according to quantity, 1-cwt. kegs included.
 Sulphonol.—10s. 6d. per lb.
 Tartar Emetio B.P. cryst. or powder.—2s.—2s. 2d. per lb.
 Thymol, Puriss.—11s. 9d.—13s. 9d. per lb., according to quantity. Firmer. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.
 Aubepine (*ex Anethole*).—10s. 6d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.
 Cinnamic Aldehyde.—Natural, 17s. per lb.
 Coumarin.—11s. per lb.
 Citronellol.—15s. per lb.
 Citral.—9s. 6d. per lb.
 Ethyl Cinnamate.—10s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—19s. per lb.
 Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Shui Oil*) 12s. per lb.—(*ex Bois de Rose*) 16s. per lb.
 Linalyl Acetate.—(*ex Shui Oil*) 14s. 6d. per lb.—(*ex Bois de Rose*) 18s. per lb.
 Methyl Anthranilate.—9s. per lb.
 Methyl Benzoate.—4s. 6d. per lb.
 Musk Ketone.—36s. per lb.
 Musk Xylol.—8s. 6d. per lb.
 Nerolin.—3s. 9d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—11s. per lb.
 Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 6d. per lb. Vanillin.—19s. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—20s. per lb. Bourbon Geranium.—11s. 3d. per lb.
 Camphor.—63s. 6d. per cwt. Cananga, Java, 20s. per lb.
 Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure.—8s. per lb.
 Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 19s. per lb. Lemon.—9s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—9s. 9d. per lb.
 Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 23s. 6d. per lb. Japanese, 9s. per lb. Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The Complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Mar. 28th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Feb. 10th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Artner. 1492. *See X*.
 Bartling, Honigman, and Trocknungs- Verschwelungs- u. Vergasungs-Ges. Heat treatment of fine grained material. 41. Jan. 18.
 on and Denholm. Drying-apparatus. 1510—1. Jan. 18.
 on and Smallwood. Furnaces. 1899. Jan. 22.

Haddan (Stettiner Chamotte Fabrik). Ovens for chemical etc. processes. 1389. Jan. 17.

Hammond and Shackleton. Concentrators, dehydrators, etc. 1925. Jan. 22.

Hase. Optical pyrometer. 1516. Jan. 18.

Heppner. Materials for storing explosive gases. 1657. Jan. 20. (Ger., 20.1.26.)

I.-G. Farbenind. Converting insoluble substances into a state of aqueous solution etc. 1769. Jan. 20. (Ger., 20.1.26.)

Staatliche Porzellan-Manufaktur. Suction filters. 1544. Jan. 18. (Ger., 19.1.26.)

Ward. Separating liquids from gases. 1796. Jan. 21.

Wilderman. Filter presses. 1888. Jan. 21.

I.—Complete Specifications

22,271 (1925). Heraeus (Ges.) and Feussner. Thermocouples and thermo-elements. (264,201.)

25,735 (1925). Hatfield. Chemical analysis of liquids. (264,237.)

1689 (1926). Rees. Pulverising, mixing, and separating machines. (264,324.)

12,641 (1926). Morgan. Heat-exchange apparatus. (264,377.)

21,148 (1926). Braeg. *See VII*.

II.—Applications

Akt. Ijungsströms Angturbin. Producing an air mixture for combustion in furnaces. 1512. Jan. 18. (Sweden, 19.2.26.)

Boehringer Sohn. 1338. *See XX*.

Broadhead. Regenerator settings for manufacture of gas. 1323. Jan. 17. Producers for heating carbonising-plant. 1325-26. Jan. 17.

Hackford. Burning fuel. 1698. Jan. 20.

Haddan (Kohlenveredlung A.-G.). Distillation of bituminous substances, fuels, etc. 1742. Jan. 20.

Heppner. 1657. *See I*.

I.-G. Farbenind. Production of unsaturated hydrocarbons. 1364. Jan. 17. (Ger., 19.1.26.) Conversion of saturated hydrocarbons. 1627. Jan. 19. (Ger., 20.1.26.)

Mardles and Stern. Preventing detonation in internal-combustion engines. 1525. Jan. 18.

Nishida and Shinada. Preparing artificial petroleum etc. from rubber waste etc. 1980. Jan. 22.

Smit. Adsorption charcoal. 1746. Jan. 20. (Holland, 23.1.26.)

II.—Complete Specifications

32,894 (1925). Hamp. Apparatus for making artificial fuel. (264,309.)

14,091 (1926). Fischer and Tropsch. Purifying gases from sulphur. (254,288.)

*32,598 (1926). Steinschneider. Distillation of oils from petroleum, tar, etc. (264,476.)

*495 (1927). Brégeant. Gas-producing apparatus. (264,482.)

*952 (1927). Burger. Apparatus for splitting acetylene. (264,500.)

III.—Complete Specifications

*32,598 (1926). Steinschneider. *See II*.

*891 and 3 (1927). Soc. Anon. La Trinidad. *See IX*.

IV.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of mordant disazo dyestuffs. 1523. Jan. 18. Manufacture of indigoid dyestuffs. 1853. Jan. 21.

IV.—Complete Specifications

*960 (1927). I.-G. Farbenind. Manufacture of grey to black vat-dyestuffs. (264,502.)

*961 (1927). I.-G. Farbenind. Manufacture of alkyl-pyrazolanthrone. (264,503.)

*1292 (1927). I.-G. Farbenind. Manufacture of carbazole-quinones. (264,530.)

V.—Applications

Hands. Compositions containing cellulose esters etc. 1441. Jan. 18.

Potts (Arnold Print Works). Treatment of cellulosic materials. 1792. Jan. 21.

V. Complete Specifications

25,702 (1925). Oberrheinische Handelsges., and Ubbelohde. Producing fibres capable of being spun. (264,233.)

15,032 (1926). Dubac. Increasing the strength and elasticity of vegetable fibres. (254,695.)

24,721 (1926). Oberrheinische Handelsges., and Ubbelohde. Producing fibres. (264,428.)

*1291 (1927). Heberlein & Co. Improving artificial fibres. (264,529.)

VI. Applications

Benckiser and Drausbach. 1871. *See* VII.

Brandwood. Apparatus for colour treatment of yarns. 1910. Jan. 22.

Hill. Production of finishing on textile fabrics etc. 1777. Jan. 21.

VI.—Complete Specification

14,164 (1926). British Celanese, Ltd., Addy, Billing, and Halkyard. Treatment of yarns or threads. (264,382.)

VII. Applications

Benckiser and Drausbach. Stabilising bleaching-liquors. 1871. Jan. 21.

L.-G. Farbenind. Concentration and distillation of hydrogen peroxide solution. 1363. Jan. 17. (Ger., 18.1.26.)

Krebs. Apparatus for electrolysing solutions of alkali chlorides. 1850. Jan. 21 (Norway, 23.1.26.)

Montecatini Soc. Gen. per l'Ind. Mineraria ed Agricola, and Khen. Manufacture of sulphuric acid. 1606. Jan. 1. (Italy, 19.1.26.)

Soc. Chim. Usines du Rhône. 1601. *See* XX.

Stockholms Superfosfat Fabriks. 1876. *See* XVI.

Takayama. Collecting potassium salt etc. from waste liquor. 1979. Jan. 22.

Tardan. Manufacture of lead monoxide. 1885. Jan. 21. (Fr., 30.1.26.)

VII.—Complete Specifications

21,148 (1926). Bracq. Pyrites and other furnaces. (264,411.)

*30,881 (1926). L.-G. Farbenind. Process for the production of sodium sulphide. (264,464.)

*223 (1927). Norsk Hydro-Elektrisk Kvaestofakt. Production of granulated dust-free nitrate of lime. (264,480.)

*986 (1927). Meyer and Meyer. Manufacture of copper sulphate. (264,810.)

*1164 (1927). L.-G. Farbenind. Manufacture of phosphorus and phosphorus oxides. (264,520.)

*1363 (1927). L.-G. Farbenind. Concentration and distillation of solutions of hydrogen peroxide. (264,535.)

VIII.—Application

British Thomson-Houston Co., Ltd. Treating silica articles. 1845. Jan. 21. (U.S., 21.1.26.)

VIII. Complete Specifications

*707 and 837 (1927). Soc. Anon. Manuf. des Glaces et Prod. Chim. de St. Gobain. Glass. (264,490 and 264,495.)

IX.—Application

Massie. Colouring cement, concrete, etc. 1648. Jan. 20.

IX.—Complete Specifications

12,711 (1926). Lindemann. Making mortars and cements. (252,210.)

*32,251 (1926). Schantz. Preserving wood etc. (264,473.)

*891 and 3 (1927). Soc. Anon. La Trinidad. Manufacture of bituminous or tarry emulsions. (264,496-7.)

X.—Applications

Artner. Production of platinum contact bodies etc. 1492. Jan. 18. (Ger., 15.2.26.)

Bennett and Hadfield. Electrodeposition of metals. 1922. Jan. 22.

Buddens. Reducing ores etc. 1508. Jan. 18. (Ger., 20.1.26.)

Croese. Treatment of ores. 1716. Jan. 20.

Lawes. Alloy for galvanising. 1865. Jan. 21.

Marks (American Smelting & Refining Co.). Apparatus for dezinizing lead. 1869. Jan. 21.

Mond (Metallbank und Metallurgische Ges.). Roasting fine sulphide ores etc. 1821. Jan. 21.

X.—Complete Specifications

19,803 (1925). N. V. Philips' Gloeilampenfabr. Precipitating metals on an incandescent body. (249,067.)

25,774 (1925). Boorer, Britten, and District Chemical Co., Ltd. Fluxes for welding. (264,238.)

19,408 (1926). Krupp Grusonwerk. Treating tin-containing ores and metallurgical products. (256,634.)

21,148 (1926). Bracq. *See* VII.

21,834 (1926). Kelly. Alloys. (264,414.)

*7431 (1926). Clausson & Co. Electrodeposition of chromium and its alloys. (264,442.)

*22,249 (1926). Dwight and Lloyd Metallurgical Co. Sintering-machines. (264,450.)

*1278 (1927). Kropf. Alloys of high melting-point. (264,528.)

XI.—Applications

A.-G. Brown,* Boveri, & Cie. Electric furnaces for heating gases. 1701. Jan. 20. (Ger., 22.1.26.)

Aletter and Strasser. Electric accumulators. 1418. Jan. 17. (Ger., 16.1.26.)

Bennett and Hadfield. 1922. *See* X.

Bia and de Bielze. Manufacture of plastic dielectric substances. 1416. Jan. 17.

D.P. Battery Co., Ltd., Drake, and Waddell. Storage-battery cells. 1538. Jan. 18. Galvanic batteries. 1600. Jan. 19.

Internat. General Electric Co. Electric arc furnaces. 1737. Jan. 20. (Ger., 20.1.26.)

Krebs. 1850. *See* VII

XI.—Complete Specifications

23,227 (1925). Linebarger. Electric storage batteries. (264,205.)

26,504 (1925) and 1693 (1926). Wade (N. V. Philips' Gloeilampenfabr.). Introducing potassium or caesium or rubidium into electric discharge tubes. (264,258.)

1210 (1926). Haddan. Electric accumulators. (264,318.)

14,071 (1926). Distilleries des Deux-Sèvres. Simultaneous dehydration and purifying of alcohol. (253.128.)

*31,381 (1926). L.-G. Farbenind. Manufacture of condensation products of urea and formaldehyde. (264.466.)

*979 (1927). Chem. Fabr. vorm. Schering. Manufacture of new chlorido compounds of alpha-aminopyridine and its derivatives. (264.508.)

XXI.—Application

Thornton. Film material for multi-colour transparencies. 1680. Jan. 20.

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Steel blooms, mild steel angles

(A.X. 4149 and A.X. 4150). *Belgium*: Steel (79). *British India*: Foundry coke, moist white lead (South Indian Railway Co., Ltd., 91, Petty France, Westminster, S.W.1). *Canada*: Fireclay (B.X. 3168 and 3180). *Germany*: Oil cakes (83). *Italy*: Leather (86). *Norway*: Metal pipes (88); Iron and steel, metals (89); Coal, coke (90). *Poland*: Tin, nickel, copper, mercury (91). *Turkey*: Iron, black and galvanised sheets (A.X. 4159).

Magnesium Compositions

The Magnesium Flooring Materials Association, 'an organisation which is entirely technical and non-trading, has issued a booklet setting forth the advantages of magnesium compositions for flooring and similar work. The booklet gives an interesting general account of the materials required for magnesium oxychloride flooring, and illustrates the many and growing uses to which it is put. Copies of the booklet can be obtained from the Association (at 106, Fenchurch Street, London), and correspondence is invited from those interested in the subject. It is proposed to publish, from time to time, data for the assistance of users of magnesium flooring.

EDITORIAL

Publicity in Industry

WE have read recently two interesting pamphlets, one on "The importance of publicity in industrial accounts," by Mr. Norman Duthie, a well-known Glasgow accountant, the other on "The facts of industry," prepared by a committee consisting of Lord Astor, Prof. Bowley, a London professor of statistics, Mr. Harold Brown, a solicitor in the City with much experience, Mr. J. T. Brownlie, the well-known Trades Unionist, Mr. W. L. Hitchens, chairman of Cammell Laird & Co., Mr. F. Hodges, the Miners' Secretary, Mr. Layton, the editor of the *Economist*, Mr. Kenneth Lee, the chairman of Tootal, Broadhurst & Co., Sir William McLintock, the accountant, Mr. J. J. Mallon, now Warden of Toynbee Hall, and for many years a close student of sweating, unemployment, and such matters, Mr. Pugh, the Labour leader, Mr. Seeborn Rowntree, and Mr. H. B. Usher. Some of these gentlemen we happen to know personally; the others are well known by name and reputation: they form a committee representing many varieties of industrial activity, and it is not easy to think of any of them whose opinions are not entitled to careful consideration. So far as our own experience goes we find ourselves in accord with much which has been stated in these two pamphlets. Mr. Duthie's paper appeared in the *Accountants' Magazine* for December last; the committee's "Facts of Industry" is published by Macmillans, and costs one shilling. We can state that these two pamphlets should be widely read. In discussing them in these columns we find ourselves in a singular position; most of our readers desire information on new points of industrial chemistry; these pamphlets have nothing to do with chemistry, but are of great interest to the chemical industry; there is hardly any journal in the world which has so great a difference in the intellectual tastes of its readers as this, and we have therefore no hesitation in publishing, or

commenting upon, matters of pure and applied chemistry, and also such matters of accountancy, company law, economics, and commerce as are dealt with in the committee's report. The broad principles can be understood by us all. It is argued by the writers we refer to that the statistics of the industries of this country should be accessible to both employers and employed, in order that the economic facts in the industry should be understood by both for their joint benefit, and for improving their mutual trust, and should be accessible to the trading and industrial community as a whole, so as to avoid, or at least mitigate, the violent fluctuations which now exist, and should also be available, to a greater extent than now prevails, for the benefit of the investing public. The statistics of this country at the present time are late in appearing, incomplete, and often misleading. Take the balance sheets and profit, and loss accounts of many of our most prosperous companies as an instance; prudence is believed to compel many such companies to conceal a considerable proportion of their profits, and while the population as a whole is so ignorant of finance this may be true, but there is no doubt that a really intelligent public would realise the necessity for storing up capital in a business, and it would not be necessary to conceal the fact: the community can only become intelligent in this respect as the result of knowledge, and for this knowledge greater statistical publicity is essential. The boards of many companies are afraid of publishing the full measure of their profits in prosperous times because they know that exceptional prosperity is always brief, that their business will continually want more and more capital, and that many of their shareholders do not so firmly believe these facts as the directors themselves. A business which distributes 100% of its profits is on the road to ruin; even 80% of its profits is too much. Those concerns which are normally profitable, and are content to pay away to the shareholders from 50 to 60% of their profits may, after a few years, look

forward with confidence to a continuance of their business, and to prosperity for their employees and their shareholders. An intelligent public will know this, and we are of opinion that it is the duty of each industry to train up its own public to understand such matters, and that generally speaking and with due reservations the fuller information is made known the better for all concerned. The committee makes out a good *prima facie* case for a belief that part of the violence of the trade fluctuations is due to the ignorance of the public on the statistical position. We are all inclined to buy on a rising market and to postpone buying on a falling market, and in this way we let sentiment promote the boom and unduly aggravate the slump. There are important considerations also to urge in connexion with industrial unrest, but these can be better read in the documents we are discussing than abstracted here. The chemical industry is one of the largest in this country, one of the most enlightened, and one in which statistics of costs and output are most promptly and accurately obtained by individual concerns. The Society of Chemical Industry has an Engineering Group and a Fuel Section; will it some day have a section devoted to the economics of the chemical industry? The scientific examination of these would be of great interest. It may be thought that the economics of the chemical industry might be safely left to the Association of British Chemical Manufacturers. If there is any truth in the statement so often made in these columns and elsewhere that many chemists engaged in industry would be wise to interest themselves in the business side of life as well as the scientific, then it is desirable that these financial matters should be studied by chemists also, and not exclusively by manufacturers.

Synthetic Dyestuffs

In a few years it will be unnecessary to have such a heading: all dyestuffs will be synthetic: we are sorry, we like to think of the indigo plantations, of madder, of lichens, of saffron and logwood. Our likes and dislikes have very little to do with the question; any place where power is fairly cheap and where chemists are plentiful will suffice for the manufacture of the dyestuffs of the future. The raw materials carbon, oxygen, hydrogen, and nitrogen are available everywhere: they are so plentiful that we need not consider them at all: skilled and accurate chemists, experienced in research, are necessary for the dyestuff industry, both in studying their manufacture and their use; while they are busy in their manufacture, they can hardly help making discoveries of new pharmaceutical products, new fine chemicals, new solvents and many other new substances, a few of which are valuable and the majority valueless. There is an enormous quantity of elementary research going on in our Universities and elsewhere: after a certain amount of this education, for it is hardly anything more, the chemist is drawn into the best, almost the only, opening for him, the dyestuff industry, and there he discovers new scents, new photographic chemicals, and perhaps new dyestuffs. Perkin was trying to make quinine, when he discovered mauve: those who try to

make new dyestuffs may discover anything. Just as our universities are the training ground for pure chemistry, so are the dyestuff manufactories the training grounds for applied chemistry. It is here, in the main, we must look for the applied chemistry of the future. Neither post-graduate courses, nor lavish Government grants, nor voluminous text-books and journals can compensate for the lack of this industry. It is a pity that the industry is so handicapped as it is: it makes perhaps 1500 different kinds of dyes, half of which are probably unnecessary: if 750 varieties only were made, it would be better for the industry, but a rigid self-denying ordinance would be necessary to prevent this number growing week by week. It takes a long time and costs a great deal of money to introduce a new chemical into use on so large a scale as to become profitable, and a great deal of capital has been locked up in this way, some of which will never reap an adequate harvest, although it has not been entirely wasted. The fact that the dyestuff industry is essential to the progress of applied chemistry, and the fact that much capital is locked up in the present, in the confident belief that it will yield dividends in the future, are considerations which cannot be disregarded when we reflect upon the supply and demand of the world in relation to aniline dyes. We will state the essential figures and leave our readers to solve the puzzle, and if they are so fortunate as to be able to peruse the Monograph on the Chemical Industry, prepared by the A.B.C.M., they will find indeed a little guidance, but yet ample opportunity for reflection and speculation. The production of dyes in Germany is about 70,000 tons a year, the capacity of their works anything from 160,000 to 250,000 tons: we shall not be far wrong if we say that their production is about 35% of their capacity; the production in the United States is about 30,000 tons a year, the capacity about 57,000: production is about 53% of capacity; in Great Britain the capacity is about 40,000 tons, the production about 17,000 tons, say, 42% of the capacity; in France, the capacity is about 22,000 tons, the production, say, 16,000 tons, say, 72%; in Switzerland the capacity is about 16,000 tons, the production about 11,000, say, 70%. If we turn to the countries which import dyes, we find that the imports are as follows:—China, about 30,000 tons; India about 8000; Russia about 3600; Japan about 3100, and the United States about 2600 tons a year. There seems very little likelihood that the production of dyes in the five great producing countries will increase by, say, 30% in the next few years, and this increase at least is needed to put the existing works on to an economic basis. The problem urgently deserves consideration by the leaders of the chemical industry in the five countries we have mentioned; it is worthy of note that international conversations have already taken place, and in some instances chemical manufacturers have made important agreements with each other. We fully expect that so obvious and serious a problem has not been forgotten by the leaders of the industry. No great country can afford to scrap its dyestuff industry, no great country will desire to have a capacity far in excess of the probable demand. What solution will be found we can only guess.

THE PRODUCTION OF POWER FROM TOWN'S REFUSE*

By J. W. REBER, M.I.Chem.E., and ANDREW SCOTT

Thirty years ago it would have been difficult to convince those responsible for refuse disposal of the possibility of power production from town's refuse. Although the power derived from a modern destructor is a valuable commercial asset, it must be kept in mind that the incineration of refuse is primarily a hygienic necessity. In many existing destructor plants the power obtained is just sufficient to cover the requirements of the plant itself, for driving blowers, clinker crushers, mortar mills, etc. These destructors represent the earlier type of design, and were undoubtedly a step in the right direction from a sanitary point of view. It will be shown, however, that with plants of improved design a considerable amount of power can be produced to-day by the complete incineration of town's refuse. It is evident that with fuels of low calorific value, such as refuse, more attention must be given to the scientific design of the destructor, in order to obtain a high efficiency and to make the plant a commercial success.

NATURE OF REFUSE

The nature of the refuse varies to a very great extent in the various towns throughout the country. This applies also to the composition of the refuse in the various localities of the same town. Large shopping centres supply a much greater percentage of paper, straw and light debris than is usually obtained from private houses. Further, the composition varies to a smaller or greater degree during the seasons of the year. Spring and summer refuse will contain a much larger percentage of vegetable matter, whereas the winter refuse contains a much higher percentage of combustible matter such as coal, coke, etc. Trade refuse differs with the industries in the neighbourhood. The average composition of dry refuse in Britain may be taken to be approximately as follows:—

Fuel, consisting of cinders, partly-burnt and unburned coal and coke, etc. ...	25	35%
Dust	30—40	%
Debris, bottles, china, etc.	10—12	%
Tins, metals, etc.	1—2	%
Light refuse or tailings, made up of vegetable refuse, paper, rags, and light trade refuse	10—12	%

The Engineers' Year Book of 1913 gives the result of an analytical examination of the London refuse, being the average of 1000 cartloads, as follows:—

Coal, coke, breeze and cinders	26.05	%
Ash	47.00	%
Dust and dirt	9.78	%
Papers, straw, fibrous material and vegetable matter	13.15	%
Rags	0.40	%
Bones and offal	0.37	%
Bottles, glass and crockery	2.57	%
Metals	0.68	%

* Read at a Joint Meeting of the Fuel Section, the Bristol Section and the Chemical Engineering Group of the Society of Chemical Industry on Feb. 3, 1927.

The amount of refuse collected in the London area is about 1,500,000 tons for a population of 4.5 millions, or approximately one-third of a ton per head per annum. For towns with a smaller population, say, up to 250,000, the amount of refuse is about 300 to 400 lb. per annum per head. As an average figure for Britain, 450 lb. per annum per head should be approximately correct.

COLLECTION AND DISPOSAL OF REFUSE

The collection of town's refuse is accomplished by horse-drawn vans, motor lorries and electrically-driven vehicles. In many cases, in fact in most cases, the vehicles are of the open type, which does not represent the most hygienic method of collection.

After collection, the actual method of disposal of the refuse varies again for various towns and localities. The question of disposal has to be considered from the following points of view:—

1. Most advantageous and expeditious.
2. Cheapest and most hygienic.
3. That most suitable to local conditions.

At the present time the following methods of disposal are employed:—

1. Dumping on waste land into old clay pits, quarries, etc.
2. Tipping into the sea.
3. Pulverisation for use as manure.
4. Complete separation for salvage purposes.
5. Incineration as a whole in destructors.
6. Partial separation and incineration.

1. *Tipping on Land.*—A considerable portion of the refuse in this country is disposed of by dumping on land. Years ago, when rates for cartage, bargeing, etc. were as low as 1s. 6d. to 2s. 6d. per ton, there was an economical justification for dumping. From a sanitary point of view there never was and never will be the slightest justification for this method of refuse disposal. Refuse tips infect the surrounding country with disease-spreading pestilential odours, and are, according to the reports of Medical Officers of Health, the happy breeding grounds for flies and rats, infesting the houses in the vicinity. In America, where a greater variety of methods of disposal have been tried than in this country, it is now recognised that incineration is the only correct solution of refuse disposal. A biting criticism of tipping, and similar methods of disposal by Dr. Heder, Medical Officer of Health in the United States, is given below:—

"Unquestionably, gentlemen, the proper plant for garbage disposal is to destroy it by fire, and not to try to utilise it for feeding swine, hauling it out and burying it, or making any attempt at reduction. We do not want to pollute the atmosphere of the suburban portion of our city with the stench which emanates from hog-pens and from the stuff which is hauled there, a good part of which the hogs themselves will not eat. . . . Such, in my opinion, is a menace to the public health of any neighbourhood, and is not only unsatisfactory, but disgusting."

Another aspect of the refuse tipping question is the carting cost. The present economic conditions and increasing costs of transport have raised the cost of

disposal in some towns to the alarming figure of about 10s. per ton, and as high as 20s. per ton, including expenses for collection. In the administrative County of London we believe that about 80% of the total refuse is dumped at an approximate cost of £2,000 per day.

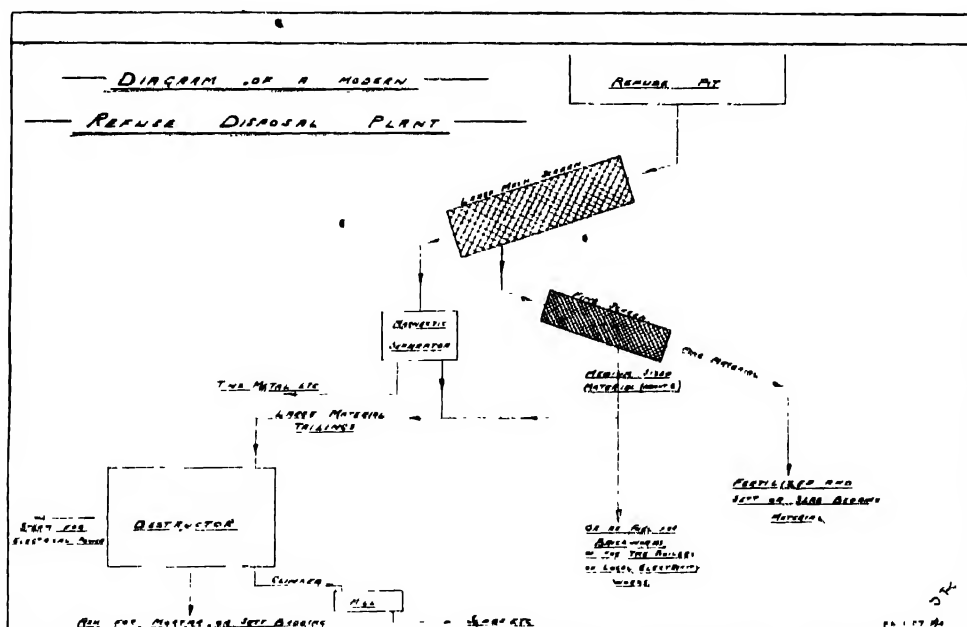

Mr. W. J. Steele, A.M.I.C.E., the then Deputy City Engineer of Bristol, in his paper read before the Association of Cleansing Superintendents of Great Britain, at the Bristol Conference, June, 1903, on "Some methods of utilising town's refuse," presented some very interesting figures, of which an abstract is given below:

"During the year ending March 25, 1903, 85,911 tons of refuse were collected, or 1 ton for every four persons. Of this quantity, 33,149 tons were treated at the destructor, the remainder being tipped. Had the whole of the refuse been treated at the destructor, the total difference in cost over the cost of tipping would have been £3,500—equivalent to a halfpenny rate."

Without going further into this method of refuse disposal, it may safely be stated that this system does not solve the problem from a sanitary or financial point of view.

3. *Pulverisation.*—This method of disposal consists of pulverising the refuse for manure. Except in very remote cases, this has not been found to be a profitable or successful method—unprofitable on account of the transport and handling charges, and unsuccessful as the refuse still maintains the whole of its organic qualities.

4. *Separation for salvage.*—This consists of the complete separation of the refuse, partly by hand and partly by mechanical means, with the object of disposing by sale of everything of market value, such as paper, tins and metals, rags, bottles, pottery ware, etc. The residue is dumped on the land. This solution of disposal is highly unsanitary, and it is questionable whether in any individual case it has proved a commercial proposition.

2. *Refuse tipping at sea.*—This method is chiefly resorted to in seaport towns which do not possess destructor plants, and in other cases, where suitable river or canal connexion is available, the refuse is sent down to the seaport from inland towns. In such seaports a good-sized barge, into which the refuse is tipped, is moored in the harbour. Very often a depot is installed as well at which the refuse is stored if the barges cannot proceed to sea owing to unfavourable weather. The refuse from these depots has to be shovelled into the tipping trucks, which again are run out on the wharf and tipped into the barge. This additional handling of the material increases considerably the cost of refuse disposal. It has been proved that quantities of refuse dumped at sea are returned to the beaches and foreshores in the vicinity. Experiments carried out in America have shown that the refuse must be taken approximately 60 miles out to sea to ensure its non-return on the incoming tide, which again involves heavy expense.

5. *Incineration without separation.*—From a hygienic aspect alone, the complete incineration of town's refuse, without any separation by hand or mechanical means, would be the ideal solution of refuse disposal. Practically all the earlier types of destructors were operated on these lines. However, most of the designs of these destructors were weak. Apart from the fact that the refuse was not burned down completely to a hard and innocuous clinker, the obnoxious fumes escaping from the chimney raised a strong public prejudice against refuse destructors; what clinker was obtained from these plants, also, had no commercial value.

With the introduction of high-temperature destructors of modern design, wherein mechanical charging and clinkering are generally adopted, a good, serviceable, hard clinker is obtained, as well as a higher evaporation per ton of refuse burnt. The improved quality of the clinker proves it to be a valuable by-product, and in many cases auxiliary plants are installed consisting of clinker crushing and screening plant, mortar mills, slab- and

block-making machines, tar macadam plants, etc. Apart from supplying the requirements of the municipality concerned, the sale of the surplus clinker products gives a useful return to be set against capital and standing charges.

In many cases it is found, however, to be of advantage to screen out the fine dust and to eliminate as far as possible all tins and metals, the latter especially in view of the utilisation of the clinker as a by-product. This represents the type of plant described in the following paragraph.

6. *Partial separation and incineration.*—Partial separation consists of screening the refuse and eliminating the tins, metals, etc. The number of gradings in the screening operation vary in accordance with the extent to which separation is required, and may be anything from two to four. In many cases the dust alone is screened out. A further separation of tins and metals is carried out by hand on picking belts, or by a magnetic separator attached to the end of the screen. A typical layout of the separating operation of a partial separation and incineration plant is shown on the diagram attached. The diagram in this case illustrates the separation of fine dust and large screenings only (see p. 120)

A more complete separation plant and one which finds considerable favour is as follows:—The refuse is discharged from the collecting vehicles into a receiving hopper, from which it is mechanically fed to a revolving screen. The screen in this case is of three mesh: No. 1 for the fine dust, No. 2 for the cinders, breeze and coke, and No. 3 for brickbats, broken crockery, bottles, etc. The rejects or the larger material, on leaving the screen, pass through a magnetic separator for the elimination of tins, metals, etc. After leaving the magnetic separator, the large material is conveyed on to a picking belt, where all materials such as paper, rags, bones, bottles or anything else it is desired to salvage are either hand picked or collected by mechanical means. The residue, commonly called "tailings," is then conveyed onwards to the charging floor of the destructor or incinerator. The fine dust screened out of the refuse may be used as a fertiliser or for mixing with clay in brick manufacture, or, in many cases, it is used for bedding sett and paving slabs. The medium-sized screenings, which consist for the most part of cinders, coke and spent coal, are in many cases sold as fuel to brickworks or to the local electricity works, to be used as fuel on their existing boiler plants. As an alternative, this material may be mixed again with tailings and burnt in the destructor furnaces. The largest screenings, which as a rule consist chiefly of brickbats, stones, broken crockery, etc., are generally ground up for mortar used for concrete aggregate or hard core filling. The tins recovered by the magnetic separator are pressed into bales by hydraulic pressure and despatched to the de-tinning works.

Time and space does not permit any further description of the various auxiliary plant requirements of refuse disposal works. Reference must be made, however, to the very important question of transport or conveyance of refuse within the plant itself. An installation provided with an efficient furnace, but supplied with a

wrongly designed or inefficient conveyor or refuse-handling plant may condemn the plant as a whole from the commercial point of view. The same will hold good for the reverse conditions. The design of the refuse-handling plant, which is entirely an engineering problem of transport, is therefore just as important as the solution of efficient incineration, which must be considered purely from a heat recovery aspect.

CALORIFIC VALUE OF REFUSE

As already stated, the composition of the refuse varies greatly. It is evident, therefore, that any variation in the composition of the refuse will actually affect its calorific value. A further factor which influences the nett calorific value is the moisture content of the refuse. Refuse of the same calorific value on a dry basis, will obviously give different nett calorific values with different moisture contents. The moisture consists partly of hygroscopic or normal moisture and partly of adherent moisture. A fair amount of vegetable matter in the refuse will give a high amount of hygroscopic moisture, although in appearance the material would seem to be fairly dry. The adherent or adventitious moisture depends to a great extent on the system of collection of the refuse—whether in open or closed vehicles, the manner in which the refuse is stored by the householder, whether in open or closed dust bins, weather conditions, etc. Winter refuse will show a higher calorific value than spring and summer refuse, and contains a larger percentage of breeze and cinders. The nett calorific value may vary from 1500 to 5000 B.Th.U. per lb., and in some cases it may rise as high as 6000 B.Th.U.

The calorific value of the material as supplied to the furnace varies again in accordance with the method of separation of the incoming refuse. For example, the calorific value is increased by screening out the dust. Tests carried out on the Continent resulted in an increase of the calorific value to the extent of 23% by eliminating 25% of the material in the form of fine dust; and with 35% dust elimination the increase in the heating value was as much as 40%. The calorific value can also be considerably increased by suitable protection of the material against the weather during the period of collection, as well as screening out the dust as far as it is economically possible. The nature of the refuse and its varying composition make it very difficult to determine its calorific value correctly over a long period as a basis for a scientific test or heat balance on a destructor plant.

MECHANICAL AND CHEMICAL ANALYSIS

A mechanical or physical analysis of refuse is adopted to determine the quantities and proportions of vegetable matter, cinders, clinker, ashes, paper, wood, straw, rags, metal, dust, etc., and can be used to calculate the approximate calorific value of the refuse.

The difficulties met with in the accurate determination of the calorific value of the refuse apply also to the chemical analysis. Although from a scientific point of view a knowledge of the calorific value and the chemical analysis of the refuse is desirable to determine the correct design of the plant, the variations in the composition

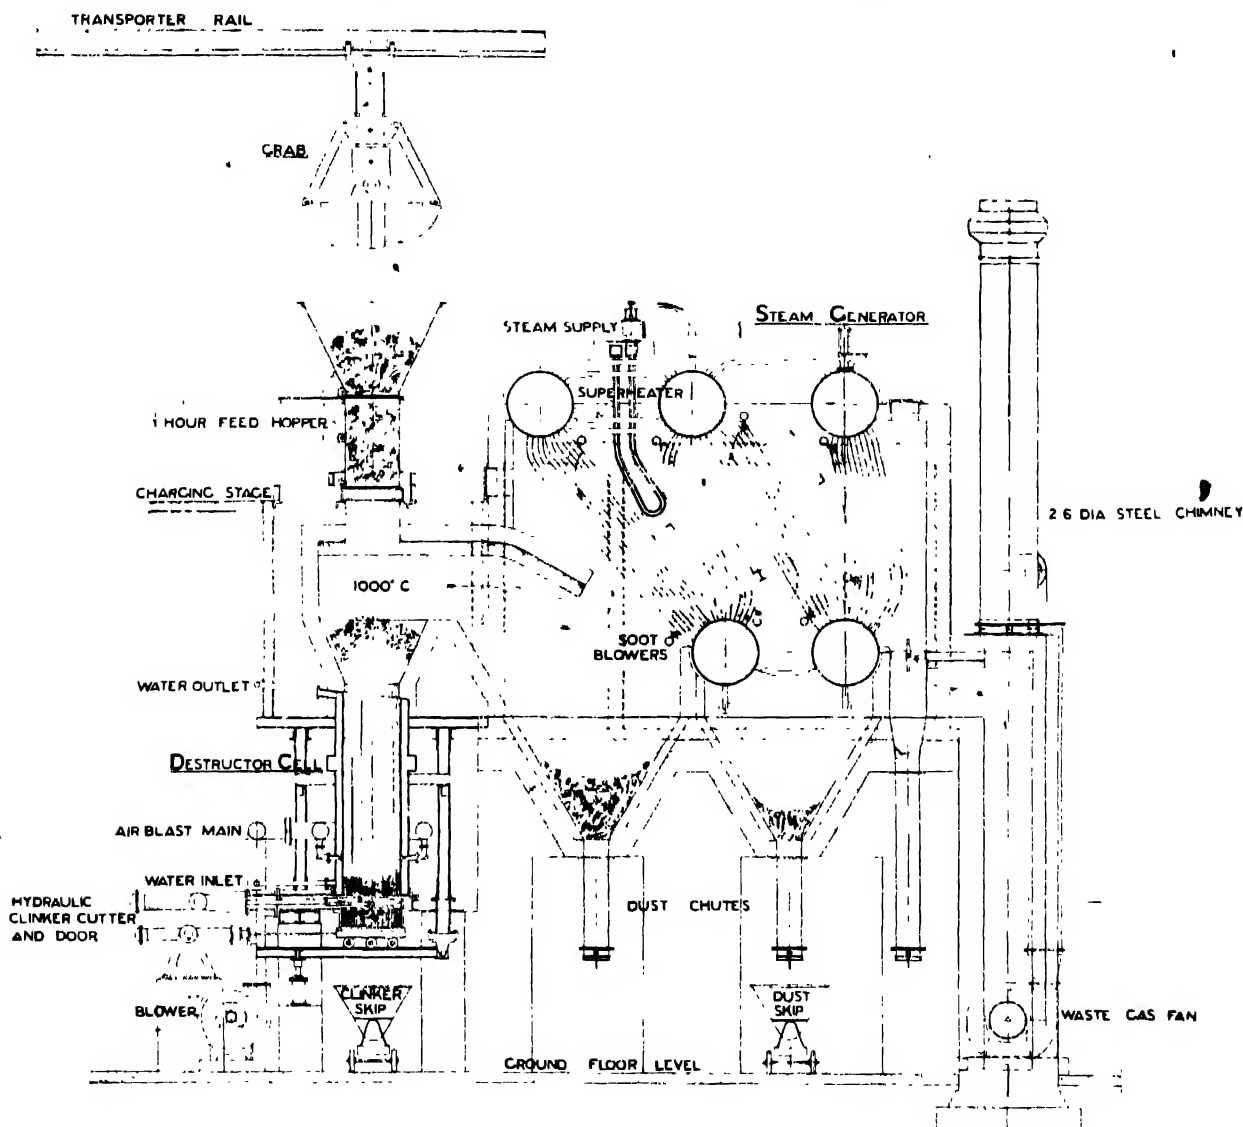

of the refuse are so great that a considerable allowance must be made in the data upon which the design is based.

EVOLUTION IN THE DESIGN OF DESTRUCTORS

The earlier designs of destructors consisted of brick furnaces, generally fitted with flat grates which were worked on natural draught; as a rule no endeavour was made to make use of the heat from combustion.

later years, when the design had been considerably improved, these plants still met with a good deal of opposition and adverse criticism.

A progressive step was made by the introduction of artificial draught, which enabled a steam boiler to be included in the installation. The artificial draught consisted of a pressure fan delivering air to the furnaces at anything up to 4 in. water gauge. In many cases steam jets were employed in place of blowers.

In these earlier designs the refuse was hand-fed into the furnaces by means of shovels, and the clinker, which was generally of a very poor quality, was extracted by hand.

Apart from the arduous labour involved in the working of these furnaces, the combustion was slow and incomplete, resulting in considerable trouble owing to the emission of fumes and dust from the chimneys.

These conditions naturally did not tend to make the refuse destructor a popular installation, and even in

At this stage the refuse destructor became a steam-raising plant, but the amount of steam generated was seldom more than just enough to drive the fans, feed pumps and auxiliary plant connected with the destructor. These plants were still hand-charged and hand-clinkered, but the methods of charging were altered.

At this period there were the three following distinct methods of hand-charging.

(a) Front-feed, where the refuse was shovelled into the furnace from the front just above the floor level,

the clinker being extracted by the same door similar to the general type of coal-fired boilers.

(b) Back feed, where the refuse was shovelled into the furnace through a special charging door situated at the back and at a higher level than the grate.

(c) Top feed, where the storage hopper was situated over the furnace arches and the refuse was hand-raked through openings in the arches.

The next development in the design of refuse destructors came about by the introduction of pre-heated air for combustion, the drying-hearth, diversions from the ordinary flat grate and improved charging and clinkering devices. With these improvements in design, the refuse destructor then became a much more efficient steam-raising plant, capable of supplying power for other purposes than its own requirements. The clinker was improved in quality and became of certain commercial value. As a result of these developments refuse destructors are doing valuable work to-day. They are working in conjunction with electrical generating stations, sewage-pumping stations, etc., where coal was used prior to the installation of the destructors, and in many cases are generating, from refuse only, the whole of the steam power required.

As a deviation from the usual practice of complete combustion, refuse destructors have also been designed and built on the gas producer principle. This producer gas, generally called "vegetable gas," is used for firing steam boilers and for driving certain types of gas engines.

From this stage, the design of refuse incinerators has not made much further progress until within the last few years, when with the introduction of the shaft furnace, completely water-cooled and fitted with positive mechanical charging and clinkering devices, we arrive at the very latest and most efficient design. The following description and particulars concerning this most up-to-date installation will be of interest.

The destructor consists of a circular steel water-jacketed shaft furnace, surmounted by a refractory brick combustion chamber. The refuse is fed into the furnace from an overhead hopper through a mechanically-operated door. The hopper is fed by a grab hoist, or conveyor, or other suitable means, according to the general layout of the plant. The requisite combustion air supply for the blast is delivered by means of a high-pressure blower, through a number of tuyères, placed circumferentially at the lower part of the steel jacket. Owing to the high pressure of the blast, a very high temperature of combustion is obtained in the furnace. The clinker consequently is fused and cut off at intervals from 30 to 60 minutes by means of a hydraulically-operated knife, which also forms a closure of the furnace base, whilst another lower hydraulically-operated door is opened to discharge the block of clinker cut off. The duration of a clinker operation is less than one minute. The clinker is cut away at some distance from the zone of maximum temperature, the drop in the sensible heat of the clinker being utilised for pre-heating the incoming air. The water supply for the cell jacket is maintained from an overhead tank, the supply for which again can be taken conveniently from the hot well of

the generating plant. The cooling water leaving the jacket is used as feed water for the boiler. The combustion gases leave the furnace at a temperature of from 1000-1200° C., and pass forward to the boiler, which is of the water-tube type, and is specially designed for this type of plant. Two dust chambers situated below the boiler, collect most of the dust brought over by the gases from the furnace. A final dust collector is placed on the discharge side of the waste gas fan, before the waste gases are delivered into the atmosphere by the chimney. Soot blowers are installed to keep the surfaces of the boiler tubes free from dust. These blowers are essential to ensure maximum efficiency in a plant of this nature. Each furnace or cell is capable of burning 24 tons of refuse per day. The clinker produced is of excellent quality, and is a suitable material for the manufacture of artificial paving stones, etc.

The amount of steam raised per ton of refuse varies naturally with the calorific value of the material burnt. For average town refuse having an average calorific value of 3000-4000 B.Th.U. per lb., approximately 1.5 to 2 lb. of steam can be raised per lb. of refuse on this modern type of Woodall Duckham refuse destructor. With a turbo-generating plant, based on a steam consumption of 17 lb. of steam per kw., it is possible to generate 150 to 200 kw. on the switchboard per ton of refuse burnt. The power requirements of a modern plant, including grab hoist or crane, screens, magnetic separators, conveyors, blowers, hydraulic and circulating pumps, clinker and mortar mills, etc., amount to about 30 kw. per ton of refuse burnt, leaving a considerable surplus of electrical energy for other purposes. One first call on this power would probably be the charging of electric accumulators for driving the refuse-collecting vehicles. Further advantages of this shaft furnace incinerator are lower labour costs, maximum burning capacity with minimum ground space, and a complete absence of dust and fumes from the chimney. A diagrammatic layout of this type of destructor is given in the attached drawing (see p. 122).

Town's refuse is potential power. A town with a carefully-operated system of refuse collection and a well-designed modern refuse destructor should be able to raise power far in excess of that required for the refuse disposal plant. A large city with a population of 1,000,000 inhabitants should be able to obtain from its refuse 25,000,000 kw.-hrs. per annum, after liberal allowance for all power purposes required for collection and disposal. The value of this electrical energy represents over £100,000 per annum.

AMMONIUM SULPHATE IN JAPAN

The Japanese output of ammonium sulphate in 1925 amounted to 130,000 tons, but the annual production is expected to reach double that figure shortly as some of the largest manufacturers are greatly increasing the capacity of their plants. The demand for ammonium sulphate in Japan has increased from 120,000 tons in 1914 to 330,000 tons in 1925, and will, it is estimated, reach 400,000 tons in 1926. This increase is due to the shortage of bean cake, hitherto largely used as a nitrogenous fertiliser in Japan.

SOCIETY OF CHEMICAL INDUSTRY

• OFFICIAL NOTICES

TAR CONFERENCE PAPERS

The papers that were presented before the Manchester Tar Conference in November last have now been published in bound form at the price of 2s. 6d., post free.

Copies can be obtained from the General Secretary of the Society of Chemical Industry, Central House, Finsbury Square, London, E.C.2, and orders should be accompanied by the appropriate remittance.

CONGRESS OF CHEMISTS HANDBOOK

This Handbook, which has been prepared by the Committee of the Congress under the Editorship of Mr. W. H. Coleman, contains, in addition to a full programme of the meetings, an account of some of the more important chemical and allied industries in and around London. A useful map of Central London accompanies it. A copy of the book was presented to every member attending the Congress, but a considerable number of copies is still on hand, and the General Secretary will be pleased to send one to any member who was not present at the Congress, on receiving his name and address, with 6d. in stamps to cover the postage.

AMERICAN SECTION

The Perkin Medal meeting of the American Section of Society of Chemical Industry was held on Friday evening, January 14, 1927, in Rumford Hall of the Chemists' Club, as a joint meeting with the New York Section of the American Chemical Society, New York Section of the American Electrochemical Society, and American Section of the Société de Chimie Industrielle. The meeting began at 8.15 with Dr. L. V. Redman in the chair.

Dr. Redman opened the meeting by reading telegrams from several friends of Dr. Teeple, including a particularly interesting one from the staff of the plant of the American Trona Corporation. He then introduced Prof. L. M. Dennis, of Cornell University, who told of the thorough foundation which the Medallist had obtained at that University, where he took his Doctorate. Prof. Dennis paid particular tribute to the teaching ability of the Medallist.

In the absence of Dr. C. H. Herty, his paper was read by Dr. Ellwood Hendrick. Dr. Herty pointed out that many of the lines of work with which Dr. Teeple has been connected are so strictly confidential that they could not be made available. But there is a wealth of record of achievement ample to testify to Dr. Teeple's remarkable versatility, his activities covering the manufacture of sulphuric acid, of special chemicals: the design of plants for the manufacture of nitric and hydrochloric acids; and the production of caustic soda and potash, chlorine and permanganate. Again, we see him at work in the field of enzymes and ferments, whilst various problems connected with the production of tartaric acid and its salts demanded for a time his constant attention. Next there is noted active participation in problems connected with the distillation of hardwoods, and for many years he gave himself unreservedly to the complicated chapters connected with the utilisation of pine wood,

both by destructive distillation and by extraction of its resinous content. In this latter work he was led to study thoroughly a new product which appeared at the distilleries where steam-distilled wood spirits of turpentine was prepared. By careful study of this product, pine oil, he found its chief constituent to be a *lævo* modification of alpha-terpineol, little dreaming at that time how great a role this new product was to play in flotation processes for the utilisation of low-grade ores.

Surely no man would ever dare to consider himself a foremost expert in so many and such varied lines, and yet in all of these Dr. Teeple has given service which has been ranked of the greatest value. What is the explanation? It seems to me to be this: He equipped himself with a sound general training in chemistry, covering organic, inorganic and physical chemistry. To this he added a natural gift for engineering, and then he topped it all with an abundance of common sense and a desire to play the game fair and square.

With such equipment, it is not difficult to see his method of attack upon any problem presented to him. It is well illustrated in the case of his work on decolorising carbons. When an unsuccessful process for the manufacture of this material was brought to him he did not try to patch up an inefficient machine, but deliberately set to work to study thoroughly all of the underlying fundamental scientific principles. With the new point of view gained by such studies, and with his naturally cautious temperament, small scale operations were attempted and errors discovered before they were too costly, and finally full scale operation was launched.

The years during which this varied line of work was being prosecuted were character building years also, and so, with the confidence begotten through successful work under such varied conditions, he was found prepared to undertake that great work which was uppermost in the minds of the Committee of Award, the potash and borax development at Searles Lake, California. How many of us would have dared to undertake the handling of a problem which at the time seemed such a forlorn hope? Millions of dollars had been invested in a multitude of changed plant methods, all of which succeeded in making an entirely inadequate quantity of a product which was of altogether insufficient purity. Whatever was to be done had to be carried out in a desert, the last place in the world one would select as a spot for a great chemical plant, and at that far removed from the chief points of consumption of its products. More than that, with the cessation of the war and the renewal of imports from Germany, and the hostility of fertiliser consumers to any tariff on potash, he was faced with the necessity of putting a product on the market in open competition with one of the most powerful, best organised, so-called world monopolies.

But Dr. Teeple did undertake the job, with the courage which those of us who have been thrown closely in contact with him know so well as his outstanding characteristic. How did he proceed about the work? Exactly along the lines we have already discussed. For at the very outset, after organizing his research staff, he came to grips with the scientific questions involved, and utilising that great blessing which Willard Gibbs gave to industry, he began a series of equilibrium

studies on the systems involving sodium chloride, sulphate, carbonate, bicarbonate and tetraborate, and potassium chloride and sulphate, these salts being the constituents of the brines which were drawn from Searles Lake. His problem was to separate the potassium chloride and borax, and to prepare each of these in marketable forms. These equilibrium studies, still in progress, have enabled the location already of seven quadruple points, fourteen triple points, ten double points, and eight single points. With the light gained from these studies he has been able to avoid much useless experimentation, and to get a grasp upon the whole problem which allows safe prophecy as to the outcome of modifications of present methods.

The particular problem which gave his research staff most concern was to avoid the formation of glaserite, $\text{Na}_2\text{SO}_4 \cdot 3\text{K}_2\text{SO}_4$. The solution of this problem resulted from the discovery by Mr. Burke of the research staff of a true double salt, $\text{Na}_2(\text{CO}_3 \cdot 2\text{Na}_2\text{SO}_4)$, which had not been previously described in the literature, and which was named *burkeite*. The knowledge of the existence of this double salt, together with the equilibrium studies made, pointed out the way by which the sodium sulphate could be separated from the solution as burkeite, and not as glaserite, and the potash be kept in solution and concentrated to saturation. However, there was still the problem of freeing the potassium chloride from borax. This was solved by the discovery that pure KCl would separate without a particle of borax if the hot solution was cooled rapidly and quietly to about 30°. The mother liquor from this product, on being agitated and without further cooling, deposited borax with but a small trace of KCl, and that could easily be removed. With this accomplished the way was made clear for converting a serious liability, the borax, into a most valuable asset, so that the plant is now operating for the marketing of both of these products, each of a high degree of purity.

One of the most striking engineering difficulties that had to be met was the strong tendency of the material in the evaporators to foam. This had to be overcome. A test sample made up of the pure salts corresponding in composition to the brines to be evaporated showed no evidence of this foam. He therefore concluded that the material must be organic, and here, for the time being, Dr. Teeple's natural traits seemed to desert him. Experiments involving oxidation, reduction, chlorination, electrolysis etc. all were tried with unsatisfactory results. Remedies were found, such as the use of decolorising carbon, or bone-black, but this was too expensive. The use of a film of oil was tried. While successful in stopping the foaming it brought about conditions which necessitated constant replacements, and therefore this had to be discarded. Various modifications of a mechanical nature were tried, but nothing with real satisfaction. Then Dr. Teeple came to himself again, and started out upon a systematic research to determine what the organic substance was, and its origin. A careful survey of the desert vegetation in the neighbourhood of Searles Lake showed that along with the usual desert sage and cactus was a creosote bush (*Larrea mexicana*), whose leaves were covered with a heavy coating which when extracted caused an intensive

foaming of the synthetic brine corresponding to that of the natural brine. This gummy material was washed down during the light rainfalls, and was carried into the salt deposits. A study of the material showed it to be certain resins and saponins. With this knowledge in hand, the method of attack was clear. Again the fundamental method of attack triumphed.

I know of no more fitting testimonial to the genuine success of Dr. Teeple's work at Searles Lake than the fact that within the last year the owners of the plant, who had already invested such large sums in a losing operation, were led without hesitation to invest still further amounts in order to enable the doubling of the capacity of the plant along the lines Dr. Teeple and his associates have so thoroughly worked out.

While the pessimist and the clever propagandist have been continuously asserting that an American potash industry was an impossibility, Dr. Teeple has been quietly, but efficiently, building up such an industry in our midst, and on such a sound basis that we may feel assured of its perpetuation. My own thought in closing is that, with the very recent discovery of important potash deposits in Texas and New Mexico, we cannot help a feeling of confidence that the complicated problems which will arise in connexion with their utilisation will find their solution through the work of men of the type of John E. Teeple and his associates.

Dr. Wm. H. Nichols, Senior Past President of the Society, made the presentation of the medal with a few suitable remarks.

Dr. Teeple candidly admitted that he was "fussed," by all the tributes to him which had been earned by his organisation. In his address on the topic, Expansion or Growth (cf. CHEM. & IND., January 28, p. 73), he contrasted the conditions necessary for development of a research project with those of the machine type of operation. He emphasised the importance of selection and handling of the men concerned, and attributed the success of the potash development to the ability of numerous men who had each given their best efforts. He showed pictures of a number of the leaders in the work, pictures of the plant and Searles Lake, and an outline of the composition of the raw materials.

The meeting closed at 10.15 p.m. One hundred and fifty members and guests attended the dinner before the meeting, and 300 were present at the presentation.

JOINT MEETING OF THE FUEL SECTION AND THE YORKSHIRE SECTION

A joint meeting of these sections will be held in the Queen's Hotel, Leeds, on February 28. Papers will be submitted for discussion in the probable order and timing as shown below.

Afternoon Session commencing at 2.30 p.m.—Chairman—Professor A. Smithells, C.M.G., D.Sc., F.R.S. (Chairman of the Fuel Section).

(1) "The Influence of Atmosphere and Temperature upon the Scaling of Steel." Part I.—Scaling by Air, Water Vapour, and Carbon Dioxide. By C. B. Marson and Prof. J. W. Cobb. Part II.—Prevention of Scaling by Hydrogen and Carbon Monoxide. By H. T. Angus and Prof. J. W. Cobb.

Synopsis.—A great loss of metal results from the scaling of steel during the reheating necessary in manufacturing processes. The rate of scaling is affected by the composition of furnace atmospheres, the proportion of oxygen, carbon dioxide, steam, of carbon monoxide, hydrogen, and other reducing gases. The composition of the furnace atmosphere is governed by the composition of the fuel. The paper deals with an experimental investigation of the problem which is also fundamental to any discussion of the production or elimination of smoke in the steel or engineering industries.

(2) "A Thermal Study of the Process of Manufacture of Water-gas." By Dr. A. Parker.

Synopsis.—From the data procured during an investigation of the process of manufacture of blue water-gas under conditions typical of British practice a thermal account has been constructed. The total heat supplied to the generator, in the form of coke, steam and air, is accounted for by the heat removed as water gas, steam, blast products, ashes, etc. The construction of this thermal account is described. A suggested scheme for separate thermal analyses of the air blow periods and steaming periods is discussed, and a new scheme is proposed.

4.30 p.m. Interval for tea.

Evening Session commencing at 5 p.m.—Chairman B. A. Burrell, F.I.C. (Chairman of the Yorkshire Section).

(1) "A Study of Coke Formation." By R. A. Mott.

Synopsis. A study of coke formation based on an examination of 17 coals varying in carbon content from over 90 to less than 80%, and including anthracite, strongly-caking, weakly-caking, and non-caking coals. The factors considered are pore formation, "binding" action, and swelling power. A theory of coking is developed. The relation between chemical analysis, swelling power and coking power is discussed.

(2) "Coke in Relation to some of its Industrial and Domestic Uses." By H. Hollings.

Synopsis.—Experiments upon the interaction between various types of coke and carbon dioxide will be described. The properties of coke which are desired in certain applications of the fuel are discussed with particular reference to: (a) The reactivity of coke towards carbon dioxide during the blow period of water-gas manufacture. (b) The influence of combustibility upon the ease of control of closed furnaces. The experiments to be described in this connexion elucidate some of the different experiences with furnaces of different sizes.

(3) "The Behaviour of Cokes in the Open Grate." By Margaret F. Bligh and H. J. Hodsman.

Synopsis.—The paper deals with the combustion of carbonised fuels and coal in open grate. Quantitative observations on typical carbonised fuels are recorded, and also conclusions as to the properties of a smokeless fuel which conduces to a high radiant efficiency in the grate.

Preprints of papers may be obtained from the Honorary Secretaries of the Sections. Early applications are desirable.

Members and others desirous of joining in an informal

dinner at the Queen's Hotel after the meeting are requested to send in their names to Prof. N. M. Comber, The University, Leeds.

Those desirous of obtaining more detailed information respecting the experimental work carried out at the Fuel Laboratories of the University of Leeds are cordially invited to visit the Department itself. The University may be reached by any tramcar bound for Headingley, Lawnswood, Hyde Park or Victoria Road.

The Fuel Section has been established so that the Society's treatment of this branch of chemical technology might be co-ordinated. It is hoped that all members who are interested in fuel topics will become enrolled. Those desirous of doing so should apply to the General Secretary. Annual subscription, 5s.

MANCHESTER SECTION

A joint meeting with the local section of the Oil and Colour Chemists' Association was held at the Textile Institute, Manchester, on February 4. Mr. J. B. Shaw presided over a large attendance.

A paper entitled: "The constants of colour—hue, purity, and luminosity," was read by Mr. Charles W. Gamble, O.B.E., M.Sc.Tech.

Mr. Gamble said that light was a retinal disturbance followed by vision, and unless there was such disturbance there was no light. The mixed sensation of whiteness was well-known in the broad band of colours termed the continuous spectrum. Brightness, or luminosity, of these colours was a matter of amplitude. Colour was not the same thing to all men: to one person the dying fire at the end of a carbon rod might appear red, to another greenish-grey.

A beam of light passed through a tank of clean, distilled water, was scarcely visible until suitable reflectors of glass were placed in the water, whereupon the light was clearly scattered in all directions. Upon mixing a mastic solution of resin in alcohol in the water the resin grains dispersed and scattered light. By increasing the quantity of resin grains the light varied from white to yellow and then to orange. A certain amount of interest attached to this experiment because it represented a very important natural phenomenon. What actually took place was a selective reflection or scattering. Lord Rayleigh had demonstrated that whenever light passed through a turbid medium it was scattered, and with, say, a pencil of white light the scattering which took place was inversely proportional to the fourth power of the wave-length. An increase in the number of particles gave a longer wave-length.

Lustre was not quite the same thing as sheen, although somewhat similar in character. Lustre occurred when small elements of differing reflective power were associated together, such, for instance, as a fabric woven with alternate lines of mercerised cotton and ordinary cotton, wool and silk, and silk and cotton.

Long experience, said Mr. Gamble, had taught him how difficult it was to eradicate the impression that when white light fell upon a material termed red it was not a case of that substance turning white light into red. All colour in nature came from white light, and when it was stated that a particular material had colour, what

was implied was a kind of depreciation, or another form of the same kind of sunlight. The particles of a body absorbed some radiations and rejected others, and if energy was absorbed either there must be a rise in temperature or a chemical change; in the vast majority of cases it was the former. The resulting appearance was determined by the physical condition of the absorbing body. With reflected light there was always a certain amount of unchanged white light which paled the colour. The colour produced by transmission of white light through a transparent body was always richer than when white light fell upon the surface of an absorbing body.

The surface of gold normally appeared to be yellow. When a small amount of light penetrated into the surface particles of the metal it presented a beautiful bluish-green appearance. This effect, termed dichroism, was also particularly perceptible in the wing-cases of certain beetles.

There were three constants of colour—hue, luminosity or purity. Hue was the colour itself. Luminosity or purity meant freedom from admixture with white light. The luminosity of a colour might be measured either by its relative whiteness compared with white light before it passed through the dispersing arrangement in the spectroscope, or by the more common practice of measuring the luminosity of different regions of the spectrum taken at the brightest. Yellows were always brighter than reds; reds were always brighter than blues.

It was interesting to know what amount of white might be added to a colour. If white was added to any colour to the extent of 75 times the brightness of the colour itself, the colour sensation disappeared, though this was not an exact amount for all colours. More white could be mixed with orange without any effect being perceived than with green, and still more with blue.

It had been postulated that there were in the retina three distinct sets of nerve fibres capable of transmitting light (colours). In darkness, these sets of fibres were at rest and there was no sensation of colour.

A question was once asked in a London University examination which many candidates failed to answer. It almost ranked with the celebrated question: "Why does a diamond cut glass?" The question was:

What is the colour of brown paper? The answer was: "A degraded orange," or, in some cases, "A degraded yellow."

It was far easier to observe fine detail by monochromatic light than by heterochromatic light. The effect of a variation of illumination was shown by Mr. Gamble in the case of two fabrics. In daylight one of them matched very well as a moss green; with the tungsten light it was brown. The second matched a fabric dyed blue with indigo; with the tungsten light it was dull red.

In his reply to the discussion which followed the reading of the paper, Mr. Gamble stated that the "Tintometer" was an extraordinarily valuable instrument, and its use did not require any very great skill beyond the ability to match colours.

OTTAWA SECTION

Mr. A. E. MacRae presided over a well-attended meeting on January 19, at which Mr. A. L. Davidson read a paper on yeast.

Historically, yeast has been known for ages; medicinally, it was prescribed by Hippocrates, and later by Dioscorides. The use of yeast as a food was given great impetus by the war. In Germany it would appear that yeasts were developed which used all their food material for reproduction, no alcohol being produced. Such yeasts were utilised as food for both human beings and cattle. On the side of the Allies, yeast was used by British troops in the form of an extract, de-bittered and flavoured, and it proved very efficacious therapeutically, as well as being nutritive.

In considering the cultivation of yeast as a future source of food, stress was laid on the wonderful rate of growth; overnight it will increase 50 to 70 fold under proper conditions, and this with little cost for labour. Contrast this with the time and labour necessary to raise crops or animals for food.

From the nuclein of yeast nucleic acid is obtained and combined with silver, calcium or sodium. The compounds thus formed show marked bactericidal action on injection, together with a large increase of leucocytes, and are not irritating.

CALENDAR OF FORTHCOMING EVENTS

- Feb. 14. CERAMIC SOCIETY, North Staffordshire Technical College, Stoke-on-Trent, at 7.30 p.m. (1) "The discoloration of clays during firing," by J. Konarzewski and A. E. J. Vickers. (2) "Researches on the theory of fine grinding," Part VI, by Dr. G. Martin; Part VII, by Dr. G. Martin, F. B. Turner and F. Linstead, and Part VIII, by Dr. G. Martin, W. Watson and E. Bowes.
- Feb. 14. INSTITUTE OF BREWING, *London Section*. Engineers' Club, Coventry Street, W., 7.45 p.m. Discussion on "Fermenting vessels" to be opened by E. B. Collier, A. Cotching, R. J. B. Storey, and L. E. Simpkins.
- Feb. 14. INSTITUTE OF METALS, *Scottish Local Section*. 39, Elmbank Crescent, Glasgow, at 7.30 p.m. "Notes on aluminium alloys," by D. R. Tullis.
- Feb. 14. INSTITUTE OF CHEMISTRY, *Manchester and District Section*. "Electronic theories of valency in organic chemistry," by Prof. R. Robinson.
- Feb. 14. SOCIETY OF CHEMICAL INDUSTRY AND THE INSTITUTE OF CHEMISTRY. *Joint meeting of the Edinburgh and East of Scotland Sections*. The Pharmaceutical Hall, 36, York Place, Edinburgh, at 8 p.m. "The use of the microscope in qualitative analysis," by B. D. W. Luff.
- Feb. 14. ROYAL SCOTTISH SOCIETY OF ARTS, 117, George Street, Edinburgh, at 8 p.m. "Application of coal and oil to marine propulsion," by A. Scott Younger (Keith Lecture). Also on Feb. 28 and March 14.
- Feb. 15. SOCIETY OF CHEMICAL INDUSTRY, *Glasgow Section*. 39, Elmbank Crescent, Glasgow, at 7 p.m. Joint Meeting with the Institution of the Rubber Industry. (1) "The milling of rubber," by B. D. Porritt. (2) "The hardness testing of vulcanised rubber," by T. R. Dawson. (3) "A demonstration of a new Piezo-micrometer," by J. T. Strachan.

CHEMICAL SOCIETY

Feb. 15. HULL CHEMICAL AND ENGINEERING SOCIETY. Hull Photographic Society's Rooms, Grey Street, Park Street, Hull, at 7.45 p.m. "Air conditioning and air conditioning plant," by E. G. T. Hill.

Feb. 16. INSTITUTE OF CHEMISTRY, *London and South Eastern Counties Section*. The Third Annual Dance. Hotel Russell, Russell Square, W.C.1, at 7.30 for 7.45 p.m.

Feb. 16. SOCIETY OF CHEMICAL INDUSTRY, *Yorkshire Section*. Joint meeting with the Society of Glass Technology, The University, St. George's Square, Sheffield, at 2.30 p.m. The Sheffield Metallurgical Association, Sheffield Section of the Institute of Metals and the Sheffield Society of Engineers and Metallurgists will also take part. General discussion on silicate analysis. (1) "A critical survey of methods for the analysis of the simpler glasses," by W. H. Withey. (2) "Notes on methods used in the analysis of glasses," by A. Dimbleby. (3) "The analysis of refractories," by W. J. Rees, and (4) "Notes on the analysis of silicate slags," by T. P. Colclough.

Feb. 17. CHEMICAL SOCIETY, *Ordinary Scientific Meeting*, Burlington House, Piccadilly, W.1, at 8 p.m. (1) "The production of fog in the neutralisation of alkali with hydrogen halides," by H. O. Askew. (2) "Constituents of *Myoporium laetum* Forst. (The "Ngaio.") Part II Hydrogenation of ngaione and ngaol, and dehydration of ngaol," by F. H. McDowell.

Feb. 18. INSTITUTE OF BREWING, *Scottish Section*. Caledonian Station Hotel, Edinburgh. Annual Dinner.

Feb. 18. SOCIETY OF DYERS AND COLOURISTS, *Manchester Section*. 36, George Street, Manchester, at 7 p.m. "A picture of the structure of the cotton fibre as an aid to the interpretation of some phenomena," by F. P. Slater.

Feb. 18. SOCIETY OF CHEMICAL INDUSTRY, *Glasgow Section*. 39, Elmbank Crescent, Glasgow, at 7 p.m. Fuel Lecture.

Feb. 18. SOCIETY OF CHEMICAL INDUSTRY, *Liverpool Section*. The University, Liverpool at 6 p.m. "Fuels for internal-combustion engines," by Col. Sir F. L. Nathan.

Feb. 18. SOCIETY OF CHEMICAL INDUSTRY, *South Wales Section*. Joint Dinner with the South Wales Sections of the Institute of Chemistry and the Institute of Metals. Thomas' Café, High Street, Swansea, at 7 p.m.

Feb. 19. BIRMINGHAM METALLURGICAL SOCIETY. Girls' High School, Dudley, at 7 p.m. "Blast furnace practice," by R. P. Bethell.

Feb. 23. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. "Insulin and its manufacture," by F. H. Carr, C.B.E. Dr. Henry Dale, C.B.E., M.D., F.R.S., will preside.

Feb. 28. SOCIETY OF CHEMICAL INDUSTRY. *Joint meeting of the Yorkshire Section and the Fuel Section*. Queen's Hotel, Leeds, at 2.30 p.m. (See further particulars on p. 125.)

Mar. 9 and 10. INSTITUTE OF METALS. Annual General Meeting. (For full particulars see CHEM. & IND., 1927, p. 106.)

Mar. 14. INSTITUTE OF CHEMISTRY, *Leeds Area Local Section*. "The chemist in the food industry," by B. G. McLellan. (Postponed from Feb. 14.)

At a meeting held on February 3, the President, Professor H. Brereton Baker, C.B.E., F.R.S., occupying the Chair, Dr. J. W. Baker presented the following two papers:—

The nature of the alternating effect in carbon chains. Part XIV. The directive action of some groups of the form $-CR'R''\cdot CO\cdot R$ in aromatic substitution. [With C. K. Ingold.]

ETHYL phenylacetate and ethyl phenylmalonate on nitration in nitric acid (*d* 1.5) at or below 0° give respectively 9% and 20% of the *m*-derivative. These results are taken to show the occurrence of a permanent fractional dipole in the carbonyl group similar to, but weaker than, the permanent integral dipole present in semi-polar double linkings.

The nature of the alternating effect in carbon chains. Part XVII. The directive action of the groups $-CH_2\cdot CH_2NO_2$, $-CH\cdot CHNO_2$, and $-C(NO_2)\cdot CH$ in aromatic substitution. [With I. S. Wilson.]

α -NITRO- β -PHENYLETHANE on nitration yields 13% of *meta*, whilst with ω -nitrostyrene only 2% is formed. These results indicate that, in these cases, contrary to the general assumption, the propagation of the effect due to the positive charge on the nitro-group occurs less readily in a conjugated side-chain than in a saturated chain of equal length. It is suggested that this is probably due to the neutralisation of the effect in passing through the field of the double linking, and not to the predominating *op*-orienting influence of the latter, since *p*-nitrobenzylidene-phenylnitromethane $Ph^1(NO_2)\cdot CH\cdot C_6H_4NO_2$ yields 20% of the *meta*-isomeride on nitration.

Dr. A. Ferguson then summarised the following three papers:—

The Storch equation, a general dilution formula and the validity of the law of mass action at limiting dilutions. [With I. Vogel.]

GRAPHICAL methods of testing the Storch dilution formula in its primitive and in a generalised form, and of determining the constants of the equations are described. In all the cases tested the equation in one of its forms is valid over a wide range of concentration. The constants so determined do not support the view that Ostwald's dilution formula is always followed at low concentrations.

The calculation of the equivalent conductivity of aqueous solutions of strong electrolytes at infinite dilution. Part II. Application to data at 0°, 18° and 25°. [With I. Vogel.]

A CRITICAL review of the methods previously proposed for the calculation of the conductivity at infinite dilution of strong electrolytes is given, and it is concluded that the most trustworthy is that already suggested by the authors (*Phil. Mag.*, 1925, 50, 971). The method has been applied to data at 0°, 18° and 25°, and new tables of mobilities at these temperatures constructed.

The calculation of the equivalent conductivity of aqueous solutions of strong electrolytes at infinite dilution. Part III. The mobilities of the hydrogen and the hydroxyl ions. [With I. Vogel.]

The value of the conductivity at infinite dilution for hydrochloric acid at 25°, calculated by the author's method, yields a most probable value for the mobility of the hydrogen ion of 340.05 at 25°. Kraus and Parker's value of 349.89 is criticised. The mobility of the hydroxyl ion at 18° is similarly computed from the conductivity at infinite dilution of sodium hydroxide to be 175.4. This value differs appreciably from that deduced by Raikes, Yorke and Ewart (*J.*, 1926, 630), probably on account of their use of the square root formula of Kohlrausch for the computation of the conductivity at infinite dilution.

Prof. J. C. Philip, whilst admitting that the authors had found a very satisfactory mathematical representation of conductivity values, emphasised that the values of the coefficients varied with the electrolyte and with the temperature. Hence the problem of finding an expression which would be of accurate universal application was still unsolved. The speaker further suggested that the authors had, perhaps, dismissed rather too lightly the careful experimental work of Weiland.

Dr. N. V. Sidgwick said that by the introduction of a variable "constant" and a variable power the results would naturally correspond closely with the experimental values; the function might then even allow for variations, e.g. for variations due to the presence of impurities in dilute solutions. Dr. Sidgwick preferred to employ an equation which roughly represented all the data.

Replying, Dr. Ferguson said that some slight misapprehension appeared to exist concerning the precise amount of mathematical magic used. The method did not assume even the form of the equation $\Lambda_0 = \Lambda + Bc^n$. That form was tested by the method, and the value of n deduced from the rectilinear graph followed automatically. If n were not independent of the nature of the electrolyte, but varied regularly from substance to substance, that variation represented a physical fact, which should be taken into account in any comprehensive theory of electrolytes, weak or strong.

BIOCHEMICAL SOCIETY

A meeting was held on February 7, at the Lister Institute of Preventive Medicine, when the following papers were read:—

"A new type of alkali lignin," by C. Dorée and E. C. Barton Wright. By the action of 4% caustic soda at 10 atm. pressure for 1 hr. on purified spruce wood, a new type of lignin has been obtained for which the name metalignin is proposed. This lignin has the formula $C_{20}H_{20}O_8$, molecular weight 356. It melts at 186° C. and is soluble in a range of organic solvents, differing in these respects from lignins previously described. Evidence for the presence of one hydroxyl-, two methoxyl- and two carbonyl-groupings was obtained. Metalignin agrees in composition with the α -lignin of Klason (1920) isolated as sulphonic acid from bisulphite liquors. The method of alkali resolution used

does not, as has been claimed (Mehta, 1925), give a quantitative separation of lignin."

"Observations on the purification and properties of insulin," by F. Dickens, E. C. Dodds, W. Lawson and N. F. MacLagan. The action of various protein precipitants has been studied and, applying the work of Wasteneys and Borsook to the fractionation of insulin, it has been shown that all the activity can be precipitated by adding trichloroacetic acid to an insulin solution to make the concentration up to 2%. According to these workers this would prove that insulin is a protein, or metaprotein, but it is shown that this is by no means conclusive when applied to insulin. A precipitation by 2% trichloroacetic acid effects purification, and a method is described whereby trichloroacetic acid precipitate can be dissolved in acid, re-precipitated by the addition of saturated sodium chloride, and finally converted to hydrochloride. When iso-electric precipitates of insulin are washed with neutral salts a considerable portion of the inactive material dissolves. This principle has been made use of to effect still further purification, employing neutral potassium oxalate, which is a weak buffer, to effect in the first place an iso-electric precipitate, and in the second place to hold in solution inactive fractions. The trichloroacetic acid and oxalate processes have been combined to give a complete purification process. An almost quantitative recovery of the insulin is obtained by this method. A description is given of the properties of insulin of various degrees of activity from 1.5 mg. to 0.014 mg. per international unit respectively, including full analyses by van Slyke's method, together with various qualitative reactions. From a study of the results it is impossible to state definitely to what class of protein or fission product insulin belongs.

"A labile form of organic phosphorus in the gastrocnemius of the frog," by P. Eggleton and M. G. Eggleton. The gastrocnemius of the frog contains an organic phosphorus compound which is hydrolysed very rapidly by solutions of mineral acid, giving rise to inorganic phosphate. The values obtained for the inorganic phosphate by such methods as Embden's or Briggs' are for this reason grossly misleading. This interfering compound ("phosphagen") is stable in neutral or slightly alkaline solution, and therefore allows of estimation of inorganic phosphate by the Bell Doisy or magnesium mixture methods. The inorganic phosphate content of the resting muscle is about 25 mg. of P per 100 g. In fatigue it may rise to 60; in heat rigor to more than 100. The "phosphagen" content is about 50 to 60 (as mg. of P per 100 g.), and can be lowered by fatigue as far as 10. In heat rigor it may disappear completely. Incubation of the minced muscle in sodium bicarbonate buffer causes the disappearance of "phosphagen" in the presence or absence of fluoride, but in the former case the disappearance is not due to hydrolysis, since no inorganic phosphate appears. The heart muscle of the frog contains very little "phosphagen" (about 5 mg. of P per 100 g.), and in the plain muscle of the stomach none has been detected. "Phosphagen" appears to be intimately connected with the special functions of skeletal muscle.

"Methylated derivatives of hexosediphosphoric acid," by W. T. J. Morgan. Attempts to prepare methylated

derivatives of hexosediphosphoric acid by methylation with methyl iodide and silver oxide have been made, using (1) the sodium and barium salts of the acid, (2) the free hexosediphosphoric acid in aqueous methyl alcohol, but in both cases the result was unsatisfactory. By using a solution of the acid in anhydrous methyl alcohol a fully methylated derivative was obtained, although in poor yield. It was therefore decided to convert the hexosediphosphoric acid into the methyl hexoside by Fischer's method in order to protect the reducing group from oxidation in subsequent methylation. Two isomeric barium methylhexosidediphosphates have been obtained, and have been separated by fractional crystallisation of their brucine salts from 50% alcohol, and fractional precipitation of their barium salts from aqueous solution by alcohol. The less soluble brucine salt yields the more soluble barium salt $[\alpha]_D^{25} = 8.7$.

The specific rotation of the isomeric barium salt is $[\alpha]_D^{25} = 8.2$. Neither isomer is hydrolysed ^{Hg Green} _{Hg Green} inulin.

which is in agreement with the supposition that fructose is the hexose part of the molecule. Analyses of the salts agree with $C_6H_{10}O_4(OCH_3)(PO_4Ba)_2$, thus it seems probable that the compounds are the α and β methylhexosidediphosphates. During methylation a small amount of a non-reducing-mono-methylhexosemono-phosphoric acid was produced. Analyses of the barium salt agree with $C_6H_{10}O_4(OCH_3)(PO_4Ba)$. The further methylation of these hexosides is in progress.

"Proteins of the cerebro-spinal fluid," by L. F. Hewitt. Determinations have been made of the various protein fractions of normal and pathological cerebro-spinal fluids by modifying the Wu method of plasma protein analysis. An accurate determination of the total protein content may be made using 2 c.c. of fluid. Normally the fluid contains about 0.03% of proteins, the albumin:globulin ratio being 7:1, and the greater part of the globulin fraction being pseudoglobulin. In many diseases the total protein content of the fluid is increased. In cases of tabes dorsalis, meningitis and encephalitis lethargica, not only is the protein content raised, but the proportion of globulins is increased, the albumin:globulin ratio being in the neighbourhood of 3.5:1. In general parietic patients the total protein content is considerably raised, and the proportion of globulins is uniquely high, the albumin:globulin ratio having the extremely low value of 1.4:1. A typical analysis of a general parietic fluid shows the albumin 2.5 times normal, the pseudoglobulin 9 times normal, and the euglobulin 30 times normal. The mechanism of this relative increase in the least diffusible euglobulin fraction is not explained. The power of fluids to precipitate colloidal gold appears to depend on the lowness of the albumin:globulin ratio.

"Demonstration of nitrogen technique for use with small animals," by M. H. Roscoe. The metabolism cage used was that described by Ackroyd and Hopkins. The faeces and urine separator was that of Gross and Connell. To prevent scattering of food this was given as a liquid paste. The cage, funnel and separator were washed daily with distilled water. A sufficient amount of nitrogen was obtained if two animals were used for periods of not less than four days. The method has

been tested for loss of nitrogen as ammonia, but no appreciable loss can be demonstrated.

"Meyerhof's theory of alcoholic fermentation," by Arthur Harden. In a recent account of his views on alcoholic fermentation by yeast, Meyerhof states that he has found that hexosidiphosphates can be converted into carbon dioxide and alcohol by the yeast enzyme in the absence of the coenzyme. This view differs from that of Harden and Young, who consider that the hexosidiphosphate is first hydrolysed to a hexose and a phosphate and that fermentation then occurs in the normal way in the presence of the coenzyme. The author has repeated the experiments which were made along with Young and has again been able to obtain preparations of washed permanent yeast which have practically no action on pure hexosephosphate, but ferment it in presence of the coenzyme. He therefore cannot agree with Meyerhof's proposed modification of Harden and Young's equation in this respect.

"The effect of the reaction on the osmotic pressure of serum proteins." By John Marrack and Leslie Hewitt. If the proteins of serum form ionised salts with bases, it should be possible to demonstrate an osmotic pressure due to the Donnan effect, above that due to the protein molecules alone. With 7.0% of protein this excess osmotic pressure should equal 16 cm. of water at 30° and p_H 8.2, and 3 cm. at p_H 6.6. This excess pressure at any p_H would vary as the square of the protein concentration, and thus account for the lack of proportion between osmotic pressure and protein concentration found by Verney. The authors found no difference between the osmotic pressures of serum proteins at p_H 6.6 and 8.2. The simplest explanation of this is that the compound of protein and base is only slightly ionised. However, we have found that the relation between the diffusible ions in the protein solution and that against which it was dialysed agrees with what should be found according to Donnan's principle if this compound were highly ionised.

The following papers were also read:—"The lipins of yeast," by I. S. MacLean and C. G. Daubney;—"On the nature of provitamin D," by O. Rosenheim and T. A. Webster.

SOCIETY OF PUBLIC ANALYSTS

An ordinary meeting was held on February 2, Mr. E. Richards Bolton, the president, being in the chair.

Certificates were read for the first time in favour of Messrs. W. G. Carey, W. F. Elvidge, L. S. Fraser, F. P. Hornby, G. R. Lynch, E. C. Martin, and G. G. Philip.

Certificates were read for the second time in favour of Messrs. S. Greenberg, F. C. Ray, and G. C. Matthews.

Mr. S. G. Burgess was duly elected a Member.

The following papers were read and discussed:—

"Arsenic in printing ink," by T. Hedley Barry. Most of the printing ink pigments contain arsenic, and it is possible to classify them into three groups on the basis of the amounts of arsenic present. It is shown that a limit of one part of arsenic in 50,000 of the ink pigment should satisfy the most stringent requirements of health authorities, but this mode of expression is unsatisfactory,

and it would be preferable to fix a limit of arsenic per unit area of the printed paper or wrapping.

"The immersion refractometer and its value in the analysis of milk," by G. D. Elsdon, B.Sc., F.I.C., and J. R. Stubbs, M.Sc., F.I.C. In view of the importance which certain police courts, especially in the North of England, have attached to the application of the refractometric test in milk analysis, the authors have investigated the test. Part I of the paper is an examination of the Zeiss immersion refractometer from the point of view of its use for milk. In Part II experiments are quoted to show that the refraction of a milk serum apparently changes with two factors—the percentage of solids-not-fat and the acidity of the milk. The decreased refraction due to added water may be entirely masked by the souring of the milk: in fact, up to 10% of added water might be entirely overlooked in this way. Examination of about one thousand mixed milks, shows that the average refraction for milk serum, when the copper sulphate method is used, is about 38.3 scale divisions in the case of commercially fresh milks. The conclusion is drawn that the method offers no advantage over the usual determinations, and that it has certain drawbacks peculiarly its own.

"Irish moss mucilage and a method for its determination," by Paul Haas, D.Sc., and Barbara Russell-Wells. Irish moss or carrageen mucilage consists of a mixture of two etheral sulphates. These can be determined by precipitation with benzidine chloride and titration of the washed precipitate with standard sodium hydroxide solution. Free sulphates, if present, are first precipitated by adding excess of barium chloride. The method can be used for the determination of carrageen mucilage in the presence of gelatin, gum arabic, agar-agar, and fruit pectins.

ROYAL SOCIETY OF ARTS

On February 2, Mr. N. Evers, B.Sc., read a paper on "Chemistry and the supply of drugs." Mr. F. W. Gamble presided.

After tracing the early history of the application of chemistry to the supply of drugs, Mr. Evers said that the earliest attempts to modify the structure of natural products so as to produce a modified therapeutic effect were made on the alkaloids. Cotarnine was first made in 1844, whilst apomorphine, made in 1869, was probably the first instance in which an organic compound whose structure has been modified by chemical methods was used in medicine. Homatropine was discovered in 1880, and is a parallel example.

During the latter part of the pre-war period new synthetic drugs were appearing in great numbers. The war put a sudden stop to them, and created the necessity of manufacturing the few that were really indispensable in this country; incidentally the war taught us how many of them we could do without, and numbers of them have never returned to the market. The result has been that several of the more important are still made in this country, and as far as quality is concerned can hold their own, generally speaking, with the products of foreign factories.

Chemistry enters into the supply of drugs in several ways:—(1) The isolation of the active principles of

natural drugs. (2) The elucidation of the constitution of naturally-occurring compounds. (3) The synthesis of naturally-occurring compounds. (4) The preparation of drugs by the modification of the structure of naturally-occurring compounds with change in physiological action. (5) The preparation of synthetic drugs. (6) The preparation of inorganic drugs and chemicals in a state of purity. (7) The analytical control of the supply of drugs. (8) The preparation of drugs in suitable forms for administration.

The isolation of active principles includes compounds of widely-varying chemical character, such as alkaloids, glucosides and hormones. Generally speaking, the preparation of alkaloids from plant material is a simple matter. The determination of their constitution, however, is a much more difficult problem, and even to-day the structure of some of the best known, such as morphine, strychnine, and emetine, is still undecided. Many alkaloids have been synthesised. No alkaloid, however, has yet been prepared synthetically on a commercial scale at a price at which it can compete with the natural product. When we come to deal with glucosides we are faced with a much more difficult problem. Instead of dealing with readily crystallisable compounds which form numerous crystalline salts and compounds, as the alkaloids are, we are handling compounds which are not easily crystallised, which form few derivatives. They are usually present in very small proportion in plants. It often happens, too, that several glucosides of similar properties occur in the same plant. Their separation and the determination of their composition is, therefore, a matter of great difficulty. Some progress has, however, been made recently in this direction, and has disclosed the important fact that there probably exists a close relationship between the members of the group of glucosides known as the heart poisons.

The isolation of the hormones presents us with an even more difficult problem than that of the glucosides. The active principles are often present in extremely minute amounts; they are unstable and easily decomposed by heat or chemical action. The history of adrenalin[®] may be taken as a typical example. As far back as 1894 Oliver and Schäfer remarked the effect of an extract of suprarenal glands. From this time a preparation of the suprarenal gland was used to some extent in medicine, and several attempts were made to isolate the active principle until Takamine, in 1901, was successful. Pure adrenaline prepared from suprarenal gland then replaced the gland extracts, and following the synthesis of adrenaline, which was accomplished by Stolz in 1903, the synthetic product was finally placed on the market. It will be seen that three stages are involved: (i) the use of a crude extract; (ii) the use of the pure active principle prepared from the animal; and (iii) the use of the synthetic product. The active principle of the thyroid gland, thyroxine, is the only other hormone in which the three stages are anything like complete.

Insulin, the pituitary hormone, the parathyroid hormone, and the ovarian hormone are still in the first of the stages mentioned above, and although insulin has been prepared in a highly active condition, it does not appear that a definite chemical compound has yet been obtained.

Mr. Evers next discussed the vitamins and the preparation of derivatives of naturally occurring compounds (e.g., diacetylmorphine, homatropine, hydrastinine, etc.), and then passed on to consider the synthesis of compounds containing a group essential for a characteristic physiological action. Reference was made to the hypnotics of the barbitone or veronal type, the antipyretics phenacetin, antipyrin and aspirin, the antiseptics, and the organic derivatives of arsenic, antimony, mercury and bismuth.

But while these new drugs have roused new problems, the advances in chemical and physical science have enabled us to tackle problems connected with the older drugs. Only a few years ago the preparations of ergot on the market showed great uncertainty in their activity, but chemical and physiological investigation has so improved the methods of manufacture that now physiologically standardised liquid extract of ergot can be safely relied upon.

Not the least of the problems of the manufacturing druggist is concerned with the keeping properties of pharmaceutical preparations. Many of the old and popular preparations are made from formulae which were devised in the days when they were made in small quantities. When one comes to use the same formulae for making large batches of material to be distributed, not only in this country, but all over the world, and to be stored under all sorts of conditions of heat and cold, it is perhaps not surprising that troubles occur. Many of these early formulae were devised without any thought of the possible chemical reactions which might occur in them. It would require a brave chemist to suggest a formula containing both calcium hypophosphite and sodium citrate, but quite a number of formulae contain both—sometimes calcium citrate deposits, sometimes it does not, according to the temperature. It would require even more courage in the light of present knowledge to suggest a preparation containing pepsin in alkaline solution, but several such formulae are in use in spite of the fact that after a short time no pepsin remains.

The analytical control of the supply of drugs has developed extensively in recent years. To-day practically every drug that the pharmacist or medical man receives, provided it is from a firm of repute, has been checked by analytical methods before he receives it; not only is the finished product checked, but the raw materials have been checked by analysis, possibly two or even three times.

The variety of the materials used in pharmaceutical preparations is very great: a large pharmaceutical firm may easily have 1000 or more different drugs, chemicals, and their preparations, which have to be regularly examined. The analytical work, therefore, is much more complicated than in a laboratory when only a few preparations are tested. The research department, too, has a corresponding breadth of range. It must be prepared to tackle any question at a moment's notice. It must be in close touch with the latest researches in physiology and wide awake to the most recent methods in biochemistry.

We are now entering on a period which is perhaps the beginning of a change which will result in the complete shifting of the centre of gravity of the drug position. The introduction of the hormones is the beginning of a more rational use of drugs, but its extension will raise

more and more intricate problems for the chemist. The progress of chemotherapy will necessitate the synthesis of compounds of increasing complexity. The extension of the tendencies of modern therapeutics will require increasing co-operation between pharmacologists, physiologists and chemists, between our universities and research institutions and chemical manufacturers. The medical profession must be protected, and the public must be protected against the introduction of new drugs with exaggerated statements as to their efficacy. It is easy to imagine what would have happened after the discovery of insulin had the Medical Research Council not stepped in and ensured that the product was properly manufactured and carefully standardised. Variations in activity would undoubtedly have brought insulin into such disrepute that its value to-day would be greatly restricted, even if it had come into general use at all. The Therapeutic Substances Act, when it comes into force, should provide effective safeguards in this direction.

In spite of the change in our chemical industry brought about by the war, we are still woefully deficient in our production of synthetic drugs. The amount of research in this field in this country is small indeed, compared with the importance of the subject. This is not due to a lack of chemists: there are many able chemists in this country ready, were there only the opportunities, to use their knowledge in a branch of chemistry which is, after all, the one most likely to lead to results of lasting benefit to mankind.

INSTITUTE OF CHEMISTRY

At a meeting of the Leeds Area Section on January 24, Prof. J. W. Cobb, C.B.E., spoke on "The training of a fuel chemist." A summary of the lecture follows.

The conviction that our fuel supplies must be used efficiently and economically is becoming more firmly and generally established, with the result that probably no branch of chemistry provides better opportunities for the right type of man than fuel. These opportunities come, in the first instance, in connexion with the established carbonisation industries. The gas industry depends upon scientific practice both as to its main products, its by-products, and the proper utilisation of gas, coke, and tar when they are obtained. The development of the gas industry depends on a scientifically trained personnel more than any other single factor, and the coke oven industry is in a similar position. Moreover, the need for economy in fuel utilisation, the demands for liquid fuel, particularly motor spirit, the awakening of the public conscience to the evils arising from smoke, all make for the intervention of the scientifically trained fuel technologist.

The training necessary has to meet many requirements, and, if it is to be effective without requiring an inordinately long time, a careful selection has to be made of subject matter. It would be easy to say that such a training should include courses that would mean, in essence, the superposed training of a chemist, a physicist, and an engineer in a University, followed by works experience. Such a scheme, of course, is quite impracticable, and in any case would prove stultifying by inculcating too exclusively the attitude of the acquirer of knowledge and not sufficient of the necessary readiness

for independent action and making the best use of knowledge already acquired, which is characteristic of the best type of practical man.

The course in fuel or gas engineering as given by the University of Leeds may be used simply as a peg on which to hang further explanation of what is meant by the necessary selection which has to be exercised in framing the course of a fuel technologist. The lecture courses in the first year are given up entirely to chemistry, physics, and mathematics, with an introductory course in general engineering and a short course (one hour per week) in fuel. The second year develops chemistry and engineering further, and begins to deal with such special branches of physics and chemistry as come from the consideration of the properties of gases, thermal efficiencies, calorimetry, and pyrometry all of fundamental importance to the fuel technologist. The third year may be varied, but is substantially given up to the more specialised subjects of carbonisation, fuel, and gas engineering. Laboratory work during these three years is for the first half in chemistry in the chemical engineering and physical laboratories, and the second half in the fuel laboratories, where the special technique of the fuel chemist is learned in connexion with furnaces, refractory materials, pyrometry, calorimetry, gas analysis, the methods of testing gas appliances, and the like. Touch with the most modern practice is maintained by short lecture courses given on such subjects as coke oven practice, gas works' practice, distribution, benzole recovery, by outside lecturers engaged in those branches of work. Practice in exposition by the students is obtained at a weekly colloquium where new processes or researches are explained by the students themselves. Some work experience is obtained by the students during the long vacation by arrangement with gas works, coke oven plants, producer gas plants, although the first vacation course is usually spent at a general engineering works.

This three years' course leads to a degree or a diploma.

The fourth year course consists in carrying out under supervision some piece of allotted research work, and is really a training in research methods. That leads by thesis to an honours degree. At the end of three years the successful student is ready to take a works' post in the fuel industries, with a knowledge of the principles underlying the use of fuel and of the laboratory technique employed in fuel work, and with a knowledge of industrial processes which is useful from the beginning and completed by experience.

It can be maintained with confidence that a man so trained is likely to make good.

The fourth year training is not suitable for every student, and is only recommended for those who have some aptitude for research. When taken, however, it is particularly valuable, as experience has shown.

Such is the training in the Fuel Department of the University of Leeds. In the other Universities which set out to train fuel chemists the practice is somewhat different. At London, for example, the fuel training is entirely post-graduate, following upon the completion of a full degree course in science.

The fully qualified fuel chemist is now in great demand. His work is of an interesting character, while his opportunities are great, and likely to be greater.

CORRESPONDENCE

"MEASURING THE SIZE OF PARTICLES"

SIR, - In CHEMISTRY AND INDUSTRY of January 28, 1927, I notice a paper on "A method of measuring the size of particles."

In this paper the authors appear to base the whole method upon a principle which is contrary to all the ordinarily accepted laws of hydromechanics. They assume that the difference in pressure at two points in a liquid containing suspended particles is dependent upon the mass of the particles present in the liquid between the points. This is certainly not justified by ordinary experiment, and to convince myself of its inaccuracy I constructed a similar apparatus to theirs, only I substituted a solid mass of lead hung by a fine wire for the suspended powder. The level of the liquid in the two connected tubes was noted, both when the lead was placed above the connecting tube and below it. Not the slightest difference in the level of the liquid could be detected in the two cases. According to the authors, since the mean density of the mixture above the connecting tube was about twice as much in one case as in the other, there should have been a large change in level in the side tube.

The difficulty is in this case to explain the source of the variation in level observed by the authors. As, however, it only amounted to a few tenths of a millimetre, and required a considerable optical magnification for its measurement, it was probably caused by changes in temperature, which would alter both the volumes of the various parts of the apparatus and of the liquid and powder, and also the capillary corrections (which do not appear to have been taken notice of) sufficiently to account for the small movements observed.

T. H. LITTLEWOOD

PERSONAL AND OTHER ITEMS

The Government have nominated Sir Arthur Balfour, Sir A. Norman Hill, Mr. W. T. Layton, Sir Max Muspratt, and Mr. Arthur Pugh to attend the International Economic Conference at Geneva in May under the auspices of the League of Nations. They will not in any way bind the Government, and will not be qualified to act as spokesmen of an official policy.

The object of the International Economic Conference which has been summoned by the Council of the League of Nations to meet at Geneva on May 4 is to organise a general consultation in the course of which the various programmes and doctrines may be freely exposed without the freedom of discussion being restricted by any immediate necessity to transform the conclusions of the Conference into international engagements. Many documents have been prepared for the Conference, including an important memorandum on the chemical industry, which will be published by Constable and Co., Ltd., in March.

The Medal of the Institution of Mining Engineers has been awarded to Sir John Cadman in recognition of his distinguished services to the Institution and in the general advancement of mining engineering.

The Minister of Transport has appointed Sir James Devonshire, Mr. Frank Hodges, Sir James Lithgow, Alderman W. Walker, Sir Duncan Watson, Mr. W. K. Whigham, and Brevet-Col. the Hon. Vernon Willey to the seven places on the Central Electricity Board under the chairmanship of Sir Andrew Duncan.

Mr. W. J. S. Naunton, M.Sc., has been awarded the degree of Ph.D. in science by the University of London.

Dr. R. Raper, Dr. R. D. Haworth, and Dr. L. A. Sayce have been appointed lecturers in chemistry at Armstrong College, Newcastle-on-Tyne.

The prize of £30 from the Gordon Wigan fund for an investigation in chemistry has been awarded to Mr. W. A. Waters, B.A. (Caus).

Mr. R. K. Callow, B.A., B.Sc., has been elected to a senior scholarship at Christ Church, Oxford, for research in organic chemistry.

Plans are being made for the celebration of the centenary of Lister in London by a committee consisting of representatives of the Royal Society, the medical and surgical institutions, the Universities and other institutions interested. The executive committee includes Prof. Sir Ernest Rutherford, Sir Charles Sherrington, and Dr. H. H. Dale.

Dr. R. Adams, head of the Department of Chemistry at the University of Illinois, has been chosen as the recipient of the William H. Nichols Medal for 1927, on the basis of his work on "Acids of Chaubmoogra Oil and Related Compounds." The presentation of the medal will take place at a meeting of the New York Section, American Chemical Society, on March 11.

Mr. C. H. Crane, president of the St. Joseph Lead Company, has been re-elected president of the Mining and Metallurgical Society of America.

Dr. H. R. Kruyt, professor of physical chemistry at the University of Utrecht, will be the guest of honour at the Fifth National Colloid Symposium, which is to be held at the University of Michigan, June 22 to 24. Dr. Kruyt will remain in Ann Arbor during the Summer Session of the University and will give special courses in colloid chemistry.

Prof. A. A. Noyes, a past president of the American Chemical Society, and professor of physical chemistry at the Gates Chemical Laboratory of the California Institute of Technology, Pasadena, was elected president of the American Association for the Advancement of Science at Philadelphia during the last convention. Roger Adams, one of the most prominent members of the American Chemical Society and chairman of the department of chemistry of the University of Illinois, was elected chairman of Section C of the same organisation.

The King of Italy, through the Italian Ambassador at Washington, has conferred the Order of Officer of the Crown of Italy upon Dr. C. L. Parsons, Dr. H. E. Howe and Mr. A. Seidell, in recognition of their activities in promoting international good-will through the medium of chemistry.

The late Lord Bearsted, founder of the Shell Company, left unsettled estate valued, provisionally, at £4,000,000.

The late Mr. C. A. Johnstone, of Whaley Bridge, manufacturing pharmaceutical chemist, left £22,006 (net personalty, £21,823.)

The death has occurred, at the age of 72, of Mr. Thomas Murdoch, a prominent figure in the bleaching industry.

The late Mr. E. S. Moore, J.P., founder of the Midland Vinegar Co. (now H.P. Sauce, Ltd.), left £615,769, with net personalty £609,760.

The death is announced, at the age of 85, of Mr. John Varley, a director of the Neuchatel Asphalte Co.

Fuel Problems

An important joint meeting of the Fuel Section and the Yorkshire Section has been arranged to take place at Leeds on February 28, when subjects such as the scaling of steel, the manufacture of water-gas, coke formation, coke in relation to its uses, and the combustion of cokes will be discussed in comprehensive papers. A full notice of the meeting will be found on page 125

Ephedrine

Considerable interest has been aroused by recent reports upon the use of the alkaloid, ephedrine ($C_{10}H_{15}ON$) and its salts in the treatment of asthma, for low-blood pressure in pneumonia, and so on. Ephedrine and its salts are stated to resemble adrenalin in character and action, but possess the advantage that they produce a more persistent effect, whether administered orally or hypodermically. Through the courtesy of the British Drug Houses, Ltd., we have received samples of B.D.H. ephedrine hydrochloride put up in $\frac{1}{2}$ gr. (0.032 g.) tablets for oral administration, as well as in ampoules for hypodermic use in the strength of $\frac{1}{2}$ gr. per cubic centimetre. This alkaloid has been made in the laboratories of the British Drug Houses for some months past, and the firm is now manufacturing the pure hydrochloride on a commercial scale from the Chinese plant, Ma Huang (*Ephedra vulgaris*).

Presentation to Mr. John Allan

A pleasant function took place at the Mitre Hotel, Manchester, on Wednesday evening, February 9, when Mr. John Allan was presented with a gold cigarette case by his many friends who were former students at the College of Technology attending his oils and fats classes. Mr. Allan had been associated with the college for over 30 years. The inscription upon the cigarette case was as follows:—

Presented to John Allan, Esq., as a token of respect and esteem by his friends, members of his classes in oils and fats at the College of Technology, Manchester, February 9, 1927.

The presentation was the result of a very earnest desire to show appreciation of the work of Mr. Allan and a token of regret at the severance of his connection with the college, rendered necessary by his increasing business interests. The presentation was made by Mr. L. Guy Radcliffe, M.Sc., the Chairman of the Manchester Section of the Society of Chemical Industry.

Helium or Helion?

In a letter published in *Nature* of February 5, Dr. J. Newton Friend invites opinions as to the desirability

of changing the name of element No. 2 from helium to helion. This element, writes Dr. Friend, was christened at a time (1865) when its existence was recognised on the strength of the D_3 line in the chromosphere, and when, in view of the proximity of this line to the D lines of sodium, it appeared not improbable that it was a metal. Now that helium has been isolated and even solidified, we know that it is typically non-metallic like argon and the other inert gases, and now placed in group 0 of the periodic system. Its present name, therefore, is anomalous.

International Coal Conference

The published proceedings of the International Conference on Bituminous Coal held under the auspices of the Carnegie Institute of Technology from November 15 to 18, 1926, will be available sometime during February or March, according to an announcement from the Carnegie Institute of Technology. The book will contain the full reports of about 43 papers read at the conference, the discussions, and the list of delegates. Orders for copies of the published proceedings should be sent to Arthur C. Jewett, Director of the College of Industries, Carnegie Institute of Technology, Pittsburgh, Pa. The price is \$7.00 a copy.

Pulp and Paper in Canada

The Crown-Willamette Paper Co. of San Francisco is to build one of the largest pulp plants in the world on Vancouver Island. The plant will cost £10,000,000, and will have a capacity of 1000 tons a day. Power is to be obtained from the Campbell River Falls.

Laboratory First-Aid Chart

In order to minimise the consequences of laboratory accidents, the Committee on Safety and Safeguards of the Department of Chemistry of the College of the City of New York has prepared a list of procedures for the treatment of victims of such accidents. This list considers the ordinary injuries likely to be met with in laboratories, and gives detailed directions for the treatment of poisoning by various materials used by workers with chemicals. The chart is to be published by the Fischer Scientific Co., Pittsburgh.

Chilean Nitrate

It is understood that two German producers, with quotas of about 4,500,000 quintals, and the Anglo-Chilean Nitrate Corporation, which is believed to have been offered a quota of about 4,250,000 quintals, have given notice to the Producers' Association of their intention to withdraw from the present system of controlled selling at June 30, 1927. As this withdrawal represents about 16% of the Associated Producers, the withdrawal of another 4% of the associates would, according to Messrs. Aikman (London), Ltd., make free selling practically certain.

Potash Discovery in the United States

The U.S. Department of the Interior announces the discovery of potash beds in Eddy County, New Mexico, thick enough, rich enough, and near enough to the surface to be mined, if the extent of the beds and the conditions affecting marketing are favourable. Ten groups of beds of commercial interest have been discovered by core tests. Polyhalite is the most

abundant potash mineral, but four beds of sylvite and a bed of langbeinite (with associated kainite and halite) are potentially workable.

A New Cracking Process

The U.S. Bureau of Mines announces that two members of its staff, Messrs. C. P. Bowie and M. J. Gavin, have invented a new cracking process which, it is claimed, should greatly extend the life of the oilfields of the United States, because, unlike other processes, it is applicable to heavy oils, oil shales, oil sands and tars. With present methods, petroleum fields are abandoned whilst still containing large proportions of oil, a waste which, states the New York correspondent of *The Times*, should be largely prevented by the new process.

The U.S. Glass Industry

The control of the Libbey-Owens Sheet Glass Co., of Toledo, Ohio, has been acquired by a group including the Somet-Solvay Co. of Belgium and certain financial interests. The Libbey-Owens company owns considerable interests in other glass-making concerns, including the Compagnie Internationale pour la Fabrication Mécanique du Verre, which was organised to develop the Libbey-Owens process in Europe, and operates a factory at Moll, in Belgium.

The Fixed-Nitrogen Industry

It is announced that the I.-G. has begun a lawsuit against the Gewerkschaft der Steinkohlenzeche Mont Cenis for alleged infringement of the Haber-Bosch patents owned by the I.-G. for the synthesis of ammonia. At present the capacity of the Mont Cenis process (cf. CHEM. AND IND., Feb. 4, p. 109) is believed to be roughly 1000 tons of fixed nitrogen annually, but the necessary hydrogen is recovered from coke-oven gas more cheaply than by the I.-G., the plant owned by the Rombacher Hüttenwerke and produced by the Linde Eismaschinen company being used. It is noteworthy that the basic Haber-Bosch patent expires in 1928.

The German Dye Trust

Much interest has been aroused by the introduction of the new compound fertiliser "Nitrophoska" by the I.-G., as the question of the supply of both phosphates and potash becomes important. Certain low-grade deposits of phosphate rock are available in Germany, and if this could be utilised instead of imported phosphate a definite advance would be made. Apart from phosphate, however, the success of the new fertiliser will depend upon the attitude of the Potash Syndicate, which, it is believed, is unwilling either to allow the I.-G. to sell "Nitrophoska" abroad in competition with potash fertilisers or to submit to dictation from the I.-G.

The I.-G. has acquired 50% of the shares of a Spanish company, the Fabricación Nacional de Colorantes y Explosivos, which was formed to render Spain independent of foreign supplies of dyes and explosives.

Rumours have been prevalent in Berlin of negotiations between the I.-G. and the General Electric Company for the formation of a German-American combine.

A large factory is being built by the I.-G. at Merseburg for the manufacture of synthetic liquid fuel from lignite at the rate of 120,000 tons yearly, and a new nitrate factory is being built close by, whilst the capacity of the ammonia works is to be increased by at least 50%.

REVIEWS

A STUDENT'S MANUAL OF ORGANIC CHEMICAL ANALYSIS, QUALITATIVE AND QUANTITATIVE. By Prof. J. F. THORPE, C.B.E., D.Sc., F.R.S., and MARTHA ANNIE WHITELEY, O.B.E., D.Sc. Re-issue with an Appendix on new methods of organic analysis, by H. T. MEULEN and J. HESLINGA. Pp. x+250. London: Longmans, Green & Co., Ltd., 1926. Price 9s. net.

The first seven divisions of this book, which deal with detection of elements, purification, ultimate analysis, reactions of commoner compounds, detection and estimation of radicals and systematic examination and the ultimate analysis of organic compounds by micro-analytical methods, are an unaltered re-issue of a volume reviewed in *CHEMISTRY AND INDUSTRY* of May 1, 1926, and need not be further referred to. There has now been added, however, a second Appendix on "New methods of organic analysis," by H. Ter Meulen and J. Heslinger. Some of these methods were demonstrated at the meeting of the British Association in 1926; and this collection of the contents of a number of papers by these authors should prove very convenient to chemists whose work requires special methods.

Carbon, hydrogen and nitrogen are estimated by combustion, manganese dioxide being used as an oxidising agent; the method being modified to suit substances containing halogen, sulphur or nitrogen. The direct estimation of oxygen in different classes of compounds, as well as the estimation of nitrogen by hydrogenation are described. Similarly the method of estimation of sulphur by hydrogenation, with a special colorimetric method for very small quantities, is described; as also the estimation of sulphur in petroleum products by combustion; the estimation of chlorine, bromine and iodine, both by hydrogenation, and by combustion with iron oxide. The estimation of arsenic by heating an organic compound containing the element in a current of hydrogen, the arsenic being ultimately weighed as such, is also given, as well as a somewhat similar one for the estimation of mercury.

These novel methods of analysis should prove very interesting as well as suggestive to any engaged in this branch of chemical work. T. S. PATTERSON

PRACTICAL COLLOID CHEMISTRY. By WOLFGANG OSTWALD, with the collaboration of DR. P. WOLSKI and DR. A. KUHN. Translated by J. N. Kugelmass, M.D., Ph.D., and T. K. Cleveland, Ph.D. Pp. xvi + 191. London: Methuen & Co., Ltd., 1926. Price: 7s. 6d.

The first German edition of this well-known "Praktikum" appeared in 1920, since when it has been re-issued several times, and also been translated into French. The number of experiments has now grown to 183, and in performing them the student is introduced to the special technique of colloid chemistry. Naturally, in such a small space it is not possible for the instructions to be very detailed—a distinct disadvantage to the beginner, who does not take the precautions which experience renders almost subconscious; but to the

student working under supervision and to the teacher with little time at his disposal for the rehearsal of exercises, the abundance and variety of material is a great advantage. The whole field of colloid chemistry is covered with a thoroughness and impartiality which reflect the wide interest and enthusiasm of Prof. Ostwald for the science which owes so much to him.

The book, indeed, is so valuable that it is a pity it is so badly translated. It is, perhaps, optimistic to hope for sound English style in a laboratory manual of this kind, but the language should at least be intelligible, and the statements of fact correspond to those in the original. Even Thomas Graham would hardly recognise the method given for the preparation of a ferric hydroxide sol attributed to him: "To a half saturated solution of FeCl_3 add gradually a 2N $(\text{NH}_4)_2\text{CO}_3$ solution until the resulting precipitate continues to dissolve on stirring. Dialyse preferably by warming." Again, as an introduction to the "so-called ultramicroscopic phenomena," the following cryptic statement is given: "According to the theory of microscopy, particles appearing geometrically similar are greater than the wave-length of light to which they are exposed", while the summary of the properties of colloidal particles given on page 186 should deceive all but the very elect. Besides the many curious misrepresentations of which the above are typical, there are a few errors which one can attribute to the printer. There is no index, though a full table of contents fulfils some of its functions.

P. C. L. THORNE

THE DISPENSATORY OF THE UNITED STATES OF AMERICA. Twenty-first edition, thoroughly revised, largely re-written and based upon the 10th revision of the U.S. Pharmacopœia, National Formulary, 5th edition, and the British Pharmacopœia, 1914. By H. C. WOOD, JR., M.D., C. H. LA WALL, Ph.M., D.Sc., Ph.D., H. W. YOUNGKEN, Ph.M., Ph.D., J. F. ANDERSON, M.D., and I. GRIFFITH, Ph.M. Pp. xxx+1792. London: J. B. Lippincott Co., 1926. Price 65s. net.

This book was first published in 1833, and in the course of its ninety-four years of existence has seen five eminent editors retire from the task of keeping it up-to-date. Its primary function is to provide the English-speaking pharmacist with all the information he requires about drugs, and particularly those recognised in the pharmacopœias of Great Britain and the United States. At one time the United States was the sole source of supply of such literature, but in 1907 the Pharmaceutical Society of Great Britain became a competing producer with the British Pharmaceutical Codex, which is described in the sub-title as an Imperial Dispensatory. While such books appeal mainly to pharmacists, medical men and public analysts, they are also of interest to chemists engaged in the investigation of plants and their constituents, for it so happens that much of our knowledge of this branch of chemistry has arisen directly or indirectly from the use of plants in medicine.

The monographs in this new edition of the *Dispensatory* keep the needs of these various classes of readers

well in view. They give on the whole a fair, accurate and readable statement of our present knowledge of drugs. They might sometimes be more useful by being more critical, and they contain a few statements whose accuracy is traditional rather than real. In a book covering such a wide range as that of ancient and modern drugs, minor defects such as these are inevitable, and anyone possessing special information will have no difficulty in finding points for comment in the monographs in which he is specially interested. Thus the monograph on aconite is probably good enough for ordinary purposes, but it says nothing about the important work done recently on Japanese aconites, and states wrongly that *Aconitum palmatum* contains atisine, quoting a reference in support of this which relates not to *A. palmatum* but to *A. heterophyllum*. The information given regarding Persian and Indian opiums could have been usefully supplemented in many ways by someone acquainted with the literature available on these subjects in Great Britain and India. It would probably be difficult to find a medical man in England to confirm the statement that chaulmoogra oil is very widely used in this country as a counter-irritant.

The reviewer would not willingly do anything to discourage the editors from inserting information about many of the useless things that have been, and for that matter still are, used as drugs, but some of these things might be given shorter shrift and the space saved, used for fuller information regarding more important products. For example, it does not seem reasonable in the twentieth century to devote nearly three pages to what the editors themselves regard as a discredited drug, sarsaparilla, and only one to insulin.

Most of the recently introduced drugs are referred to, but the use of suspensions of metallic bismuth for the treatment of syphilis seems to have escaped attention, for it is stated that "bismuth is not used in medicine in an uncombined state."

The book has been carefully edited on the whole, and is well indexed. For its size it is remarkably cheap, especially when compared with some technical books issued recently in this country. The editors are to be congratulated on the successful accomplishment of a difficult and onerous task.

T. A. HENRY

NEW CONCEPTIONS IN COLLOIDAL CHEMISTRY. By HERBERT FREUNDLICH, Ph.D. Pp. viii + 147. London: Methuen & Co., Ltd., 1926. Price: 6s.

The German edition of this collection of lectures was reviewed by the present writer in this JOURNAL during last year (see p. 629); it is very convenient to have an English version. It forms a supplement to the other works of Prof. Freundlich which have now been translated, and it must be confessed that this volume, prepared by the author himself, compares very favourably with translations made by others. A few of the page headings do not clearly convey the contents of the chapters, but apart from this and a few other minor matters, the conception and execution of the book call for nothing but praise.

P. C. L. T.

COMPANY NEWS

GAS LIGHT & COKE CO., LTD.

The 220th ordinary general meeting was held on February 4, Sir David Milne-Watson (the Governor of the Company) presiding. He expressed regret at the resignation of Mr. Godlee from his directorship, owing to ill-health. The directors did not propose to fill the vacancy. Mr. Henry Woodall had been elected as Deputy-Governor in place of Mr. Godlee. The past year had been a most difficult one for all the industries of the country. In anticipation of the possibility of a coal stoppage occurring, the company had accumulated good supplies of coal at its works, and when the coal strike started there was a stock equal to two months' normal consumption. With this supply, and by increasing the make of carburetted water-gas, the company was able to carry on for some time beyond the two months, but as it became more and more apparent that the stoppage was going to be a long one, it was forced to buy foreign coal, which, at one time, rose to as much as 90s. per ton. Although the strike ended on November 30, it was not until the middle of December that the company received its first supplies of contract English coal, the fields from which it mainly received its coal - namely, Durham and Yorkshire - being among the last in which work was resumed. In the depth of winter the company used nearly 70,000 tons of coal a week. It was found necessary to increase the price of gas from September by 0.2d. per therm. or 1d. per 1,000 cb. ft., and again in October by 1d. per therm. or 5d. per 1,000 cb. ft., followed almost immediately by another increase of 1d. per therm. From March next the price will be reduced by 1.4d. per therm. or 7d. per 1,000 cb. ft., and it was hoped that by the end of the year the price would be normal. The coal stoppage had cost the company an extra £2,400,000 for coal, against which £500,000 would be got back in increased prices of coke and other residuals, leaving a net burden of £1,900,000. The chairman then referred to the accounts (cf. CHEM. AND IND., Feb. 4, 1927, p. 110). The revenue received from sulphate of ammonia was about £28,000 less than in 1925, due to the lower price received from the product, brought about by the over-production of nitrogen in the world. He did not see any prospect of a change for the better in the position as regards prices. During the year the company raised £1,642,770 5% redeemable debenture stock at 97½% for the purpose of expanding the business. At the end of 1925 it applied to the Board of Trade for an increase in the standard price of gas, and, after an inquiry, the standard price was raised from 11d. to 11.4d. per therm. The company had also promoted a Bill, which received the Royal Assent in August last, by which the borrowing powers of the company were increased by over £4,000,000 and a minimum dividend had been obtained of 5% in respect of the ordinary stock. Referring briefly to the Electricity Bill, the chairman said that if gas undertakings did their duty by the public and saw that the supply of gas was always satisfactory, there would be little to fear from the shareholders' point of view as to the future. In July last their Majesties the King and Queen visited the Beckton works of the company to inaugurate the new coal-handling plant,

which is the largest coal unloading plant in the world, and is capable of dealing with 2000 tons an hour. The President of the Board of Trade, Sir Philip Cunliffe-Lister, and Lady Cunliffe-Lister, inaugurated the new coal-handling plant at Fulham, where a wharf has been constructed at which coal is unloaded from the company's own steamers. Two ships were already running there, and a third was being built. A very large economy was effected by bringing coal up the Thames by steamer direct to Fulham and not having to transfer the coal to barges at Beckton. The company was also indebted to Sir George Hume, chairman of the London County Council, for opening the new premises at Nine Elms—called Watson House—to be used as training shops for fitting gas apparatus. The amalgamation with the Brentford Gas Co. was completed on January 1, 1926, and steps were being taken to improve the supply of gas generally in the Brentford district. With regard to the general industrial position, there was no doubt that the events of the past year had dealt a very serious blow to the trade of the country, and innumerable associations and societies were being formed with the object of promoting peace and goodwill in industry, but it was desirable for each business to try to solve the problem for itself. The company had successfully done its best to secure industrial peace. In 1909 its co-partnership scheme was started, and there were now 11,500 co-partners holding over £600,000 of the company's ordinary stock. At the conclusion of the chairman's address, Mr. Henry Woodall (deputy-governor) mentioned that this was the first time the Governor had addressed the meeting under his new title of Sir David Milne-Watson, and said how much appreciated this honour was, not only by Sir David's many friends, but by the gas industry generally and by the staff and workmen.

COMMERCIAL GAS CO., LTD.

The accounts for 1926 show a profit of £132,041, plus £39,436 brought forward, compared with a profit of £139,810 for 1925. After payment of the various dividends for the June half-year, there remained £93,722. Dividends have been recommended for the December half-year at the rates of £5 6s. 8d. % per annum on the 1% stock and £5 3s. 4d. % per annum on the 3½% stock, both less tax. Notwithstanding the prolonged coal stoppage, the supply of gas in the company's area was fully maintained as regards quality and pressure. Owing to pressure of other engagements, the Hon. Kenneth Mackay has found it necessary to resign his seat on the Board, and Dr. Charles Carpenter, C.B.E., M.Inst.C.E., has been elected to the vacant directorship.

PINCHIN, JOHNSON & CO., LTD.

This well-known firm of varnish, colour, paint and enamel manufacturers, have entered into an agreement whereby the business of the old-established and highly successful paint and varnish firm of Docker Bros., of London and Birmingham, will be associated with them as from January 1, 1927. The business of Docker Bros. will be carried on as a separate concern, under the chairmanship of Mr. Docker. The directors feel that the association of interest will be of the greatest benefit to the business, and anticipate a materially increased

earning capacity. The agreement provides for the issue of ordinary shares to the vendors of Docker Bros., and an extraordinary general meeting of the ordinary shareholders will be held to pass a resolution authorising the proposed increase of capital. The usual dividend has been declared by the company at the rate of 6½ % per annum, less tax, on the preference shares for the six months to December 31, payable on January 1, 1927.

UNITED ALKALI CO., LTD.

A dividend of 10% on the ordinary shares has been declared for the past year, being the same as for the previous year.

BRITISH PHOTOGRAPHIC INDUSTRIES, LTD.

A meeting has been held on February 9 to consider proposals for the reorganisation of the capital. The scheme involves the elimination of £266,667 of the present capital by writing down the nominal value of the ordinary shares from £1 to 6s. 8d. each. The preference shares will remain as at present, but the preference shareholders will be asked to cancel all arrears of dividends up to the end of last year, and in consideration to receive an allotment of two ordinary shares for every five preference shares held. Allowing for the allotment of 150,320 ordinary shares of 6s. 8d. to the preference shareholders, the net reduction in the issued capital will amount to £216,560, of which £110,586 is in respect of such items as goodwill, premium on shares, etc., and £21,000 stamp duty etc. The balance of £84,971 will be applied to writing down other assets of the subsidiary companies, and writing off all balances standing to the debit of profit and loss accounts of those companies. The share capital of the company will then be entirely represented by actual assets held by the subsidiary companies (which are wholly owned by the parent company), excepting only £65,000 goodwill. The directors consider that profits are now being earned sufficient to justify the payment of dividends, and the object of the scheme is to get rid of the accumulated losses of recent years, so that these profits may be available for dividend purposes.

ALLIED CHEMICAL AND DYE CORPORATION

This American corporation has organised the Semet-Solvay Engineering Corporation to operate the engineering and constructional departments of the Semet-Solvay Co. (a subsidiary) and the recently acquired Steere Engineering Co.

ASSOCIATED FIRECLAY CO., LTD.

A final dividend is proposed of 4%, free of tax, on the ordinary shares, making 8% for the year, carrying forward £11,358.

BEMBERG ARTIFICIAL SILK CO.

The net profit for the year to September 30, 1926, was 1,600,000 marks (about £80,000), out of which a dividend of 8% will be paid. New investments during the year amounted to 2,800,000 marks, and 1,670,000 marks were applied to different settlements. A new factory has commenced work in America, whilst two others in Germany will start work in the near future, the funds for these extensions having been secured in the form of a long term foreign loan of 6,200,000 marks.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton, f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit.—61 O.P.—Industrial, 2s. 5d.—2s. 70d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3¾d. per lb. ex whf. Lond. in owt. kegs.
 Salammiac.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-owt. iron drums included.
 Sod. Chlorate.—2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-owt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
 Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
 Arsenic, Sulphide, Yellow.—2s. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 2d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 per ton. Scarce. Grey, £17 5s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£8 5s.—£10 per ton and upwards, according to grade and locality. Very scarce and fair demand.
 Iron Liquor.—1s. 6d. per gal. 32° Tw.; 1s. 2d. per gal. 24° Tw.
 Red Liquor.—10d.—11d. 16° Tw. per gal.
 Wood Creosote.—2s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 10d.—4s. per gal., 60% O.P. Solvent, 4s. per gal., 40% O.P.
 Wood Tar.—£4—£5 per ton and upwards, according to grade.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carbolic.—Crystals, 6½d. per lb. Crude 60's, 1s. 8½d.—1s. 9½d. per gal.
 Acid Cresylic, 99/100.—2s. 3d.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 1d. per gal. Pale, 95%, 1s. 10d.—2s. per gal. Dark, 1s. 9d.—1s. 10d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 3d.—1s. 4d. per gal., ex works in tank wagons; Standard motor. 1s. 11d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s. 2d.—2s. 5d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 11½d. to 2s. 3d. per gal. Firm. Puñe, 2s. 2½d.—2s. 6d. per gal.
 Xylol.—2s. 3d.—2s. 6d. per gal. Pure, 4s. per gal.
 Creosote.—Cresylic 20/24%.—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal.
 Naphtha.—Crude, 9½d.—1s. 0½d. per gal., according to quality. Solvent 90/160, 2s.—2s. 1d. per gal. Solvent 95/160, 1s. 10d.—1s. 11d. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s. per ton.
 Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—110s.—120s. per ton, f.o.b. according to district. Prices nominal.
 Pyridine.—90/140.—9s. 6d.—17s. per gal. Nominal. 90/190 —7s. 6d. per gal. Heavy.—7s.—70s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered price include packages except where otherwise stated.
 Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7d. per lb., naked at works.
 Aniline Salts.—7d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d.—4½d. per lb.
 m-Cresol 98/100%.—2s. 8½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—7d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 4d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xylidine Acetate.—2s. 11d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£30 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4d.—2s. 5d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots—1s. per oz.
 Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 3½d. per lb. Less 5%. Market still weak.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4d. 1s. 5d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 0½d. per lb. Less . Very firm market.
 Amidol.—9s. 6d. per lb. d/d.
 Acetanilide.—1s. 7d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—11s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Aspirin.—2s. 4d. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.

Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr. paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 4d.—2s. 5d. per lb. Potassium.—1s. 11d.—2s. per lb. Sodium.—2s. 2d.—2s. 3d. per lb. All spot.
 Calcium Lactate.—1s. 4d.—1s. 5d. per lb.
 Chloral Hydrate.—3s. 3d.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ether meth.—1s. 1d.—1s. 11½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—6s. 6d.—7s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 8d. per gal. f.o.r. makers' works, naked.
 Hydroquinone.—4s. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green. 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—22s. per cwt., 112 lb. lots.
 Magnesium Carbonate.—Light Commercial £33 per ton net.
 Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 10s. 6d.—12s. per lb., according to quantity; Liquid (95%), 12s. per lb. Detached cryst., 14s. 6d. per lb.
 Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb., Levig. 6s. 1d. per lb.; Corrosive sublimate, Lump, 4s. 8d.—4s. 10d. per lb., Powder, 4s. 3d. per lb.; White precip., Lump, 4s. 10d.—5s. per lb., Powder, 5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d. per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide, 5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d. per lb.; Sulph. nig., 4s. 10d.—4s. 11d. per lb.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonat.—15s. 6d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—3s. 9d.—4s. per lb.
 Phenazone.—5s. 9d.—6s. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 86s. per cwt., less 2½% for ton lots. Dearer.
 Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
 Potass. Ferriyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—10s. 8d.—17s. 2d. per lb.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6½d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins.
 Resorcin.—4s.—4s. 3d. per lb. spot.
 Saccharin.—55s. per lb.
 Salol.—3s.—3s. 3d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—77s. 6d.—82s. 6d. per cwt. net, according to quantity.

Sod. Salicylate.—Powder, 1s. 9 $\frac{1}{2}$ d.—1s. 10 $\frac{1}{2}$ d. per lb.; Crystal 1s. 10d.—1s. 11d. per lb.
 Sod. Sulphide.—Pure reocryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.
 Sulphonol.—10s. 6d. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
 Thymol, Puriss.—11s. 9d.—13s. 9d. per lb., according to quantity. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.
 Aubepine (*ex Anethole*).—10s. 6d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.
 Cinnamic Aldehyde.—Natural, 17s. per lb.
 Coumarin.—11s. per lb.
 Citronellol.—15s. per lb.
 Citral.—9s. 6d. per lb.
 Ethyl Cinnamate.—10s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—9s. 6d. per lb. Geraniol (*Palmarosa*).—19s. per lb.
 Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Shui Oil*) 12s. per lb.—(*ex Bois de Rose*) 16s. per lb.
 Linalyl Acetate.—(*ex Shui Oil*) 14s. 6d. per lb.—(*ex Bois de Rose*) 18s. per lb.
 Methyl Anthranilate.—9s. per lb.
 Methyl Benzoate.—4s. 6d. per lb.
 Musk Ketone.—36s. per lb.
 Musk Xylol.—8s. 6d. per lb.
 Nerolin.—3s. 9d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—11s. per lb.
 Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 6d. per lb. Vanillin.—19s. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—30s. per lb. Bourbon Geranium.—11s. 3d. per lb.
 Camphor.—63s. 6d. per cwt. Cananga, Java, 20s. per lb.
 Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure.—6s. per lb.
 Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 20s. 9d. per lb. Lemon.—9s. 6d. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. per lb.
 Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 22s. per lb. Japanese, 8s. 9d. per lb.
 Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than April 2nd. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Feb. 17th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Baily and Noel, Centrifugal separators etc. 2058. Jan. 24.
 Davenport, and Sumner, Ltd. Lubricating compound. 2477. Jan. 28.
 Garland, Edge filtration. 2548. Jan. 28.
 Gas Light and Coke Co., Hollings, Pexton, and Voss. Adsorption treatment of fluids. 2264. Jan. 26.

Kunstharzfabrik Pollak. Working up powders into artificial compositions. 2594. Jan. 28. (Austria, 15.5.26.)
 Levy. Granules for absorption of gases. 2206. Jan. 25.
 Mabag Maschinen u. Apparatebau A.-G., and Neuss. Degasification of liquids etc. 2451. Jan. 27.
 Morcier. Condensation of vapours etc. 2270. Jan. 26. (Fr., 26.1.26.)
 Pike. Drying-apparatus etc. 2427. Jan. 26.
 Soc. Electro-Mécanique d'Appareillage pour l'Essence. Protective linings for tanks. 2590. Jan. 28. (Belg., 31.12.26.)
 Webster, Kilns. 2354. Jan. 27.
 Wildermann. Filter presses. 2026. Jan. 24.

II.—Complete Specifications

22,415 (1925). Neeley and Watkins. Preventing and removing scale and incrustation in boilers. (264,551.)
 25,202 (1925). Crowther. Furnaces. (264,500.)
 26,315 (1925). Hazeldon. Distillation plants. (264,501.)
 26,507 (1925). Silica Gel Corp. Adsorbing a gas or vapour from mixtures thereof. (257,879.)
 12,294 (1926). Patart. Carrying out gaseous catalytic reactions at high temperature and pressure. (252,362.)
 15,045 (1926). Nestlé and Anglo Swiss Condensed Milk Co. Atomising and desiccating liquids. (257,893.)
 18,139 (1926). Still and Kuhn. Distillation and like columns. (264,735.)
 31,062 (1926). Svensson and Norling. Centrifugal separating-machines. (264,777.)
 *975 (1927). Bojner and Pehrson. Heating the charge in rotary furnaces. (264,825.)
 *1544 (1927). Staatliche Porzellan-Manufaktur. Suction filters. (264,838.)
 *1657 (1927). Heppner. Absorbent materials for storing explosive combustion gases. (264,846.)
 *1769 (1927). I.-G. Farbenind. Converting insoluble substances into a state of aqueous solution or suspension. (264,800.)

II. Applications

Carpmael (I.-G. Farbenind.). Activation of carbon etc. 2103. Jan. 24.
 Chavanne. Gasification of solid fuels. 2313. Jan. 26.
 Denham, and Simon, Ltd. Grading coal. 2660. Jan. 29.
 Espes. Apparatus for detecting carbon monoxide. 2312. Jan. 26. (Fr., 26.1.26.)
 Gaertner. Converting coal into hydrocarbons. 2425. Jan. 27. (Ger., 18.2.26.)
 Hoyois. Washing coal etc. 2294. Jan. 26. (Belg., 26.1.26.)
 Johnson (I.-G. Farbenind.). Treatment of hydrocarbons with electric arcs. 2055. Jan. 24.
 Nastukoff. Treating petroleum. 2569. Jan. 28.
 Ramsay. Distillation of carbonaceous material. 2022. Jan. 29.
 Tormin. Carbonising coal. 2574. Jan. 28.

II.—Complete Specifications

20,808 (1925). Millard, Atkinson, Coulter, and South Western Engineering Corp. Distilling hydrocarbons etc. and fractionally condensing the vapours. (264,549.)
 30,505 (1925). Bollmann. See XII.
 5268 (1926). Petroleum Chemical Corp. Preparation and treatment of olefines. (248,375.)
 13,660 (1926). Barbier, Benard, & Turenne. Manufacture of oil gas. (260,215.)
 *28,894 (1926). Verein f. Chem. u. Metallurg. Produktion. Re-activating exhausted pulverulent decolorising charcoal. (264,799.)
 *1364 (1927). I.-G. Farbenind. Manufacture of unsaturated hydrocarbons. (264,827.)
 *1627 (1927). I.-G. Farbenind. Conversion of pressed hydrocarbons, in gas or vapour form, esp. for research into valuable compounds. (264,845.)
 at large. We last in the eyes of
 er and general factory

*1637 (1927). Heppner. *See* I.

*1746 (1927). Smit. Adsorption charcoal. (264,854.)

III.—Complete Specification

*892 (1927). Soc. Anon. La Trinidad. *See* IX.

IV. Applications

Brit. Dyestuffs Corp., Ltd., Chorley, Hollins, and Lippworth. Production of stable diazo compounds. 2556. Jan. 28.

Gegy A.-G. Dyestuffs. 2209. Jan. 26. (Ger., 28.1.26.)

L.-G. Farbenind. Manufacture of monodiazocompounds of 1:4-diamino-anthraquinone-mono- or di-sulphonic acids. 2047. Jan. 24. (Ger., 25.1.26.) Manufacture of phthaloyl 1:2:3-thionaphthene etc. 2186. Jan. 25. (Ger., 29.1.26.) Manufacture of isatins etc. 2553. Jan. 28. (Ger., 28.1.26.) Manufacture of dyestuffs. 2667. Jan. 29. (Ger., 29.1.26.)

Schmidt. 2081. *See* VI.

Scottish Dyes, Ltd., Drescher, and Thomas. Production of dyestuff intermediates. 2565. Jan. 28.

Scottish Dyes, Ltd., Hookey, and Thomas. Production of dyestuffs etc. 2661. Jan. 29.

IV.—Complete Specifications

20,808 (1925). Millard, Atkinson, Coulter, and South Western Engineering Corp. *See* II.

25,322 (1925). Johnson (Badische Anilin & Soda Fabrik). Manufacture of vat colouring matters of the anthraquinone series. (264,561.)

29,189 (1925). Johnson (Badische Anilin & Soda Fabrik). Manufacture of vat dyestuffs. (264,631.)

Johnson. 2055. *See* II.

M.-O. Valve Co., Ltd., and Thompson. Manufacture of oxide-coated cathodes. 2078 and 2444. Jan. 27.

Wildermann. Electric batteries. 2025. Jan. 24.

XI.—Complete Specifications

9951 (1926). Zubiria. Electric induction furnaces. (251,608.)

*1701 (1927). Brown, Boveri, et Cie. Electric furnaces for heating gases. (264,849.)

*1737 (1927). International Gen. Electric Co., Inc. Electrode operation in electric arc furnaces. (264,861.)

*1850 (1927). Krebs. Apparatus for electrolysis solutions of alkali chlorides. (264,865.)

XII.—Applications

Fawcett. 2324. *See* V.

L.-G. Farbenind. Extracting vegetable oils. 2429. Jan. 27. (Ger., 27.1.26.)

Krupp Grusonwerk. Treatment of oil-containing fruits. 2101. Jan. 25. (Ger., 4.3.26.)

XII.—Complete Specifications

30,505 (1925). Bollmann. Bleaching fatty oils, mineral oils, etc. (245,745.)

*30,407 (1924). Henkel & Cie. Manufacture of glycerin containing diglycerin and poor in polyglycerins. (264,800.)

XIII.—Applications

Hempel and Mürnseer. Fire- and acid-proof pigment. 2028. Jan. 24.

Kunstharzfabrik Pollak. 2594. See I.

McMinn. Anticorrosive paint for iron etc. 2524. Jan. 28.

XIII.—Complete Specification

26,618 (1925). Pottor, Crump, and Damard Lacquer Co., Ltd. Hardening phenol-urea-formaldehyde products. (264,601.)

XIV.—Applications

Anode Rubber Co. (Klein). Drying products of caoutchouc. 2216. Jan. 25.

Anode Rubber Co. (Klein, Szegvari, and Trumball). Production of caoutchouc articles from latex. 2215. Jan. 25.

Head. Treatment of raw rubber. 2602. Jan. 29.

XIV.—Complete Specifications

4301 (1926). Carpmal (I.-G. Farbenind.). Vulcanising rubber. (264,673.)

5759 (1926). Brit. Dyestuffs Corp., Gonschaws and Naunton. Use of the mono- and di-carbalkoxy-diaryltioureas as accelerators in the vulcanisation of rubber. (264,682.)

XVI.—Application

Rhenania-Kunheim Verein Chem. Fabr. Chemical manures. 2218. Jan. 25. (Ger., 1.2.26.)

XVI.—Complete Specification

*1876 (1927). Stockholms Superfosfat Fabriks Akt. Treating phosphates and fertilising products obtained thereby. (264,867.)

XVII.—Application

Sak. Producing compound yeast etc. 2300. Jan. 26.

XVIII.—Complete Specification

*27,378 (1926). Weber. Manufacture of yeast. (264,795.)

XIX.—Applications

Leech and Sherman. Treatment of air for preservation of foodstuffs etc. 2382. Jan. 27.

Matzka and Szydlowski. Preservation of animal carcasses. 2223. Jan. 26.

Otto and Vincent. Preserving foodstuffs etc. 2164. Jan. 25.

XX.—Applications

Marks (Rohm & Haas Co.). Organic compounds. 2089. Jan. 24.

Soc. Franç. de Catalyse Généralisée. Catalytic production of methyl alcohol. 2400. Jan. 27. (Fr., 9.2.26.)

XX.—Complete Specifications

26,378 (1925). Carbide & Carbon Chemicals Corp. Glycol ethers and cellulose-ester solvents. (255,406.)

31,515 (1925). Benzol-Verband Ges. Alcohol and its homologues, and mixtures containing the same. (257,881.)

4303 (1926). Carpmal (I.G. Farbenind. A.-G.). Manufacture of condensation products of substituted acroleins. (264,674.)

5268 (1926). Petroleum Chemical Corp. See II.

12,751 (1926). Zaidan Hojin Rikagaku Kenkyujo. Preparing maleic and succinic acid from furfural. (253,877.)

18,339 (1926). Roessler & Hasslacher Chem. Co. Production of esters from amide acid sulphates. (255,887.)

*25,400 (1926). Consort. f. Elektrochem. Ind. Manufacture of acetals. (264,791.)

*27,588 (1926). Poulenc Frères. Preparation of a concentrated and stable solution of 3-acetyl-amino-4-oxy-phenyl-uronic acid. (264,797.)

*31,430 (1926). Hoffmann-La Roche & Co. Manufacture of ureides of dialkyl- or arylalkyl-acetic acids. (264,804.)

*1338 (1927). Boehringer Sohn. Acetylene for anæsthetic purposes. (264,826.)

*1399 (1927). I.-G. Farbenind. Manufacture of keto-alcohols. (264,830.)

*1627 (1927). I.-G. Farbenind. See II.

XXI.—Application

Christensen. Coloured photographic pictures. 2293. Jan. 26.

XIII.—Applications

Gush and Gush. 2211—2. See XI.

Rosenheim. 2452—3. See VII.

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Stainless table and nickel cutlery (99); Steel (A. 4175); Multitubular boiler (A.X. 4191); Porcelain insulators, insulating material (Commercial Bureau. Australia House, Strand, London, W.C.2, ref. 417). *Austria*: Raw materials and machinery for the drug, confectionery and perfumery trades, pharmaceutical chemicals, cosmetics, soap (107). *Belgium*: Tinplate (108). *Canada*: Gas-operated refrigerators (A.X. 4163); House-heating boilers (B.X. 3186); Chinaware, earthenware, paint, enamel, oil, varnish, polishes, iron and steel etc. catalogues (C.X. 2191). *Chile*: Galvanised iron sheets, brass, copper, lead, zinc (C.X. 2183). *Germany*: Road-making bituminous materials (115). *Greece*: Photographic goods, pharmaceutical products (116); Porcelain, earthenware, glassware (117). *Portugal*: Tinplate (121); *Portugal (Colonies)*: Pumps (122).

Dyestuffs (Import Regulation) Act, 1920

The following statement relating to applications for licences under the Dyestuffs (Import Regulation) Act, 1920, made during January, has been furnished to the Board of Trade by the Dyestuffs Advisory Licensing Committee. The total number of applications received during the month was 509, of which 453 were from merchants or importers. To these should be added 62 cases outstanding on December 31, making a total for the month of 571. These were dealt with as follows:—(Granted—496 (of which 435 were dealt with within 7 days of receipt); referred to British makers of similar products—58 (of which 47 were dealt with within 7 days of receipt); referred to Reparation Supplies available—6 (all dealt with within 2 days of receipt); outstanding on January 31, 1927—11. Of the total of 571 applications received, 488, or 85 per cent., were dealt with within 7 days of receipt.

Imperial Preference on Optical Goods

The Board of Trade has made a Regulation under the Safeguarding of Industries Act, 1921, to take effect on March 1, raising from 25% to 75% the minimum proportion of the value attributable to Empire labour necessary in order to qualify optical glass, elements and instruments consigned from and manufactured in Empire countries

for entry into Great Britain as goods of Empire manufacture. The goods affected include optical glass and optical elements, whether finished or not, microscopes, field and opera glasses, theodolites, sextants, spectrometers and other optical instruments, and component parts of the above.

Patents in Estonia

The Estonian Legislature has passed a law providing specially for the registration in Estonia of patents and trade marks belonging to British subjects which were registered in Russia before February 24, 1918. A copy of an English translation of the law may be seen in the Library of the Patent Office, Chancery Lane, London, W.C.2.

Dutch Trade in Artificial Silk

A considerable advance has been made by the Dutch artificial silk industry, exports having increased from 3,024,000 kg (16,511,000 florins) in 1925 to 5,544,000 kg (21,858,000 florins) in 1926. The weight of exports nearly doubled, though the value showed a smaller gain owing to the fall in prices. Exports were directed chiefly to the United States (1,699,000 kg), Germany (831,000 kg.), and Great Britain (542,000 kg.).

Plant

The first of its type to be installed in this country, a high-frequency electric furnace for the manufacture of special steel is to be supplied by the Electric Furnace Company, London, to Edgar Allen & Co., of Sheffield.

The Reading Gas Company has placed an order with the Woodall Duckham Vertical Retort and Oven Construction Co. (1920), Ltd., for a T.I.C. (lead bath) tar treatment plant, to deal with 18 to 20 tons of crude tar per 24 hours.

The Glasgow Corporation Gas Department has placed an order with the Woodall Duckham Vertical Retort and Oven Construction Co. (1920), Ltd., for a new carbonising plant to be erected at the Dawsholm Gas works. The value of the contract is approximately £245,000. The carbonising plant is to consist of 41 W. D. continuous vertical retorts, arranged in two benches each of 22 103-in. retorts, and 18 intermittent vertical chambers arranged in two benches each of 24 chambers. The installation will include coal and coke handling plant, a complete coal treatment plant, and three waste heat boilers.

Sodium Hydrosulphite

Messrs. J. B. Wilkinson, Dudley Hill Chemical Works, Bradford, announce that they are now manufacturing sodium hydrosulphite powder of a specially pure quality, which is specially suitable for use in the bleaching of sugar and other foodstuffs. This quality is, of course, suitable for all purposes for which hydrosulphite is required, whether in the bleaching of straw or gelatin, or in the application of vat dyes. Sulphites, bisulphites, sulphides, and chemicals for bleachers, dyers, and tanners, are amongst other products manufactured by this firm.

Synthetic Rubber in Russia

The Soviet Economic Council has decided to offer two prizes of £10,000 and £5,000 for the two best methods of producing synthetic rubber presented before January 1, 1928, together with a sample of the product.

LONDON, FEBRUARY 18, 1927

No. 7

EDITORIAL

The British Industries Fair

AT this time one of the greatest needs of the nation is the promotion of its industry, there have been many times in the past when such a task formed no part of the duty of the nation, and was desired by no body of its citizens. We suppose that with the exception of a few extremists the whole of the population of these islands desires industrial peace and prosperity; they are now inseparable. If the former exists, the latter will follow as a matter of course. We shall not discuss the suggestions of those people, we might almost say those misguided people, who think the nation requires a further dose of industrial enmity and dislocation, of oratory instead of work, of breaking up of business instead of building up. This would savour of politics, and we must confine our observations to that less significant part, namely, the efforts that can be made to promote British industry, apart from the consideration of that vital question, industrial peace. The people who are outside an industry can do little to help those who are engaged in the industry, beyond supplying them with prompt and reliable information and giving them the opportunity of bringing the needs and wishes of the industry before the notice of the public. The Government furnishes a great mass of useful information about trade; the Department of Overseas Trade is continually diffusing news of the greatest value; our great banks maintain a news service about the world's trade which appears to be as reliable as is possible. Lloyd's Bank Monthly is a survey of international trade conditions which is well written and well printed, and always worth reading. There are probably many other such publications. The British Industries Fair demonstrates to the world the steady progress of our great industries; it tells the world what the manufacturer is making, and it tells the manufacturer what his competitors and his customers are making. We realise the Fair is a little fatiguing; there is so much to see, so much of interest. On the other hand, you can hardly be considered a well-informed man if you do not spend at least two or three hours there.

British Chemicals

The best friend an industry can have is itself; Heaven helps those that help themselves. The mouthpiece—and, indeed, to a certain extent, the headpiece—of the

chemical industry is the Association of British Chemical Manufacturers. Who is the mouthpiece, and to a certain extent the headpiece, of the A.B.C.M. we have never enquired, and we were never good at guessing. But the A.B.C.M. is in the habit of doing its work quickly and doing it thoroughly, and as that is the main thing, we need not bother about the trimmings. The Association has, as usual, published early in the year its list of members and list of affiliated associations and a classified list, extending over 150 pages, of the chemical products made in this country with the names of the individual makers and of the most important of the uses of the respective products. If you wish to know who makes fluorescein, or formaldehyde, or fur bases, or other indispensable products, you will find it here. If you wish to know the nature and maker of ametox, bectar, duogen, oxzone or titox, turn to the list of proprietary and trade names in this volume. You need not trouble to look out glitto, izal, lysol, and solignum; you have only to look at the nearest hoarding or buy Punch. We have hunted through the list and only found one omission, and that is litharge; fortunately, we know a few makers of that commodity. The book is cheap, half a guinea only; the advertisements alone are worth the money. The book is published by Ernest Benn, Ltd. It is a handsome production; the paper, the type, the lordliness of the margins, the freedom from errors and omissions, make us envious. We ought not in fairness to give all the credit for its appearance to the A.B.C.M. or to Ernest Benn, Ltd. If you desire a good specimen of the best British printing, buy this book; it is printed in Edinburgh by R. & R. Clark, and they need not be ashamed of it. In fact, nobody concerned in the compilation or production of this volume need suffer from any false modesty. It is excellent.

King Coal

In the journals devoted to applied science which descend thickly upon us from America, France, Germany and Italy in particular, the discussion of coal problems continues with unabated vigour. We ourselves have devoted no little space to the matter, and have expressed our quiet satisfaction in the fact that British research stands high in the opinion of the world at large. We should, however, be throwing coal dust in the eyes of the smaller chemical manufacturer and general factory

manager if we were to condone his serious lack of attention to the best methods of burning coal under his boilers and recovering the maximum amount of heat possible. The Fuel Research Board and kindred organisations are engaged upon fundamental problems of coal winning and utilisation which will be ultimately solved, with consequent enormous savings to the nation. In the national coal account the pounds will, in a sense, look after themselves, but the pence must be saved by every consumer of coal. King Coal is a jealous autocrat who demands faithful service not only from his court favourites of the Fuel Research Station, but also from his every subject. He cries vengeance upon those who, still living in the nineteenth century, persist in regarding him in his erstwhile rôle of beggar at the gates of the Palace of Industry. But let us quit metaphor before we are taken to task by the severely practical chemist, and say quite bluntly that the chemical manufacturer often appears to be too engrossed in the study of complex reactions thoroughly to comprehend the apparently simple reaction

His boiler efficiency figures are often appallingly low, as a competent survey taken a few years ago shows, and as our more recent observations confirm. It can no longer be held that, even if the inefficiency of steam-raising plants be recognised, no one is at hand to supply better equipment. To-day the boiler plant manager is offered a score of combustion control devices such as carbon dioxide recorders, air control means, draught gauges, meters for solid, liquid or gas, and so forth, by means of which a full picture of the whole process of combustion and steam production may be continuously sketched. Highly efficient mechanical stokers, pulverised coal firing equipment, water-cooled walls and almost ideal refractories and heat-insulating materials represent only a few of the successes of the modern combustion engineer, who is expected to guarantee a heat recovery figure of around ninety per cent. Water-softening technique, too, has so advanced that it is almost a crime to allow scale-forming salts to pass into the steam boiler. There is indeed a way open to all owners of boiler plant to save coal, but all too frequently the will appears to be absent.

Air Preheaters and Steam Accumulators

The newer and larger chemical factories and the more modern electric power stations are showing the way to fuel economy by full utilisation. We are aware that it is easy to instal modern steam-raising plant in a new factory, but even where already existing plant stands in the account books at a considerable figure it is often ultimately profitable to "scrap" the old plant, for the economies resulting from the working of modern replacements are frequently sufficient to repay the capital loss and show in addition a margin of profit upon the new expense incurred. Moreover, where steam accumulators and air preheaters are put down, no sacrifice of old boiler plant need be made on this account. For example, although air preheaters may substitute economisers in certain instances, we know of cases where such heat-recovery apparatus has been added to an apparently complete plant consisting of boilers, superheaters and economisers. The principle of air pre-

heating demands little description. The gaseous products of the combustion of coal under boilers pass to the stack without having given up all their sensible heat so that the incoming air for the combustion zone may be preheated by heat interchange with the stack gases. In a particular instance which has come under our notice, the ingoing air was heated from normal temperature to about 115° C., the stack gases being correspondingly cooled from 240° C. to 150° C. The advantages to be gained, too, are clear. The recovery of sensible heat, otherwise wasted, increases the over-all fuel efficiency by 5-10% and working pressures are raised. There is often an increase in the initial combustion of the fuel without danger of the escape of heavy hydrocarbons to the flues. With the actual types of plant already installed in this country and abroad we have no occasion to deal at the moment. Suffice it to say that mechanical difficulties have been largely overcome, heat interchange values advanced and general simplification of working attained. Steam accumulators may well be fitted to plant from which, at one time, peak loads are demanded, and from which, at other times, steam is wasted. Steam accumulators or storage tanks are, therefore, of particular service in works where the steam demand is erratic, and may be likened to central station electrical storage batteries or regarded as a fly wheel on the steam line. An accumulator is a well-lagged, large cylindrical tank one recently installed in this country measuring 47 ft. by 13 ft. and having a storage capacity of 20,000 lb. of steam into which excess steam produced at any given time is passed, to be returned later during periods of extra demand. Boiler furnaces may thus be worked at an ascertainable even rate, with consequent economy in fuel consumption. The practical application of the thermodynamical principle that the condensation and evaporation of water are reversible is thus realised. Exhaust or excess steam enters the accumulator, and is bubbled up through the water therein through distributor pipes. The steam thoroughly agitates the water and brings it up to the equilibrium temperature. In other words, the temperature of the water eventually corresponds to that of water boiling under a pressure equal to that of the entering steam. At times of high steam demand the pressure in the steam lines drops and steam passes out from the accumulator, whilst more steam is produced by evaporation of the water, now no longer in equilibrium with the general system. The reversible condensation and evaporation process continues automatically, the valving arrangements having now-a-days been almost perfected and, so far as our knowledge goes, modern accumulators are simple and reliable pieces of plant. British-made steam accumulators are being more and more used in this country which, in the past, has not adapted itself so readily as many others to new fuel-saving devices. The clumsy-looking monstrous cylinders growing up in the none too beautiful landscape of a chemical works give no joy to the æsthetic sense, but they do save steam. The Gullivers amongst our combustion engineers must smile a little at the recollection of the lilliputian steam storage tanks fitted to explosives works' locomotives, but they may also smile happily in the service they are rendering King Coal.

THE CHEMIST—HIS PLACE IN THE VARNISH INDUSTRY*

By L. HAMBROCK

The varnish business, like many other long-established industries, has only in recent years awakened to the importance of chemistry in aiding it to solve its problems. These problems are indeed large in number. The manufactured materials enter into many branches of work. Often they are used as important intermediates. Hence it behoves the varnish maker to maintain his finished products at strictly uniform composition, both physical and chemical.

I shall enumerate some of the operations into which our products enter as important intermediates. First, and probably the largest field, is that of the manufacture of enamels, paints and railway and other car finishing materials. Then also, the printing ink manufacturer uses large quantities of our products. In the publication of the *Saturday Evening Post*, the Curtis Publication Company uses annually inks containing, among other things, nearly two thousand barrels of special varnish products. Then we have the manufacturers of insulating materials who consume many thousands of barrels of varnish annually. In each of the instances cited the materials used are of very definite physical, as well as chemical, composition. And to have any of them made up so as to fall short of their particular requirements would be a serious matter indeed to the manufacturer who uses them. Time does not permit or I could name many other important intermediate uses of our products.

How, then, has the chemist been able to fill an important part in this industry? The answer is obvious. Owing to his training he is properly qualified not only intimately to study the raw materials used, but also quickly to grasp the underlying principles of manufacture. These are, of course, the essential steps to the study of finished products and when he has arrived at that point the chemist will have found much interesting work before him. His path is indeed not a specially pleasant one, for the work is hard, and there is much ground to be covered and much experience to be acquired before he is able to make headway on his own initiative. The so-called secrets of the business are still closely guarded, and confidence is indeed hard to gain.

Before we enter into this subject any further, let me tell you what varnish is. It is usually a liquid material, but there are a few special cases when it is required in a semi-liquid or even a plastic condition. It may be classified under two general heads, namely, spirit varnishes and oleo-resinous varnishes. Spirit varnishes differ from the latter class in that they dry upon application through the evaporation of the solvents contained in them. A solution of 3-4 lb. of shellac dissolved in 1 gallon of alcohol would make a representative varnish of this class. The more recently developed nitro-cellulose lacquers as they are properly named, also belong to this class. Spirit varnishes dry quickly and adapt themselves to inside finishing requirements. With the

development of the lacquers, chemical compounds have been developed so that they give very durable service when used for exterior purposes. Hence the more recently developed methods for the finishing of motor cars and other outside uses. Oleo-resinous varnishes, on the other hand, depend not only on the evaporation of the solvents to make them dry, but they depend also upon the oxidation of the vegetable oils contained in them to complete the process of drying.

You will appreciate that we have entered a field that offers an important place to the chemist. Having first learned something of the methods of manufacture, he becomes interested in the raw materials used. These materials are too great in number for me to touch on more than the most important, and at the same time the most interesting, ones used. They are as follows:—

The copals and rosins, employed to give hardness, brilliancy and other desirable properties, according to the requirements of the varnish, are as follows:—Kauri, congo, manilla, pontianac, which are found in New Zealand, Central Africa, South America and other distant points. Then we have the soluble rosins such as damar from Batavia and Singapore. Shellac finds its way over the entire world from India, and there are the East India rosins. Gilsonite is mined in Utah, whilst the best asphalts are found in Trinidad. Linseed oil comes to us either as seed or oil from Russia, the Argentine, U.S.A. and Canada. China wood oil, or tung oil, as it is more properly named, is shipped from the interior of China. Turpentine is distilled and shipped from the Southern States, while the mineral substitutes come from the U.S.A. and Mexico. Large quantities of the crude materials from which very good substitute solvents are made are shipped in tank steamers from Mexico.

With so many complex raw materials to deal with, the chemist finds plenty of interesting and important work before him. When he commences to gather the chemical and physical data required to enable him to determine purity and other desired features in this mass of complex organic, as well as inorganic materials, he will need to rely on much original work. He cannot hope to find much written data concerning the materials at hand. This is not quite so true to-day, however, as it was a few years ago. Much work has been done and published, but it is not easily accessible. It may interest you to hear a few of the details concerning the nature and special properties of some of the more important materials.

First the copals. They are fossilised exudation of trees, and the outstanding desired quality is their hardness. Amber from which pipe stems are made is a very hard copal, and was used when found more plentifully for varnish-making purposes. Copals in their natural state are insoluble in vegetable oils, and are of no use for varnish manufacture unless preheated or fused until a loss of 10—25% by weight has taken place. In the proper fused condition they are soluble in oils, and may readily be incorporated with oils and other materials. Each grade and kind of copal requires a different method of handling before the best results can be obtained. In many cases they are fused to what the varnish maker

* Paper read on Oct. 19, 1925, before the Montreal Section.

terms a physical end point, and a slight deviation, one way or the other, will cause the copal to be either insoluble or just completely soluble in the oil added. In good varnish making, this experience is indeed open to a lot of hard work.

The choice of the most suitable copals does not lend itself to much chemical work for the varnish maker. There are so many different kinds, and so many grades of each, that suitability depends entirely upon practical experience obtained through working with them. I will give you an example. I have before me two gradings of kauri copal: one a pale grade, while the other is rather dark. The dark grading, however, is much harder than the pale grade, and is suited to the manufacture of rubbing and polishing varnishes. The pale grade is better suited to the manufacture of railway and other high-grade exterior finishing varnishes. I have thought that a melting-point determination would be of value, but after many trials the results were so inconsistent, that I found such a determination unreliable and of no value from a varnish maker's point of view. To show you the possibilities of chemical work, I will cite an instance where, for certain reasons, it was desired to have the acid number of a completed varnish as low as possible. Kauri gum was used, and the acid value of the kauri in its natural state was found to be 72, i.e., 72 mg. of caustic potash was required to neutralise the free acid when the powdered copal was refluxed in a bath of neutralised alcohol and benzol. The copal was fused, and when fusion was completed, a sample was taken and the acid value was found to be reduced to 56. At this point various neutralising agents, among them calcium carbonate, zinc oxide and glycerin were used alone and in various combinations. By making the necessary checks in the laboratory, the desired degree of neutralisation was determined and the factors entering into it were properly recorded, so that in this particular instance a very much desired varnish was produced and the entire working was determined by means of chemistry. I have pointed to this one instance merely to show how it was possible, in a concrete way, to apply chemical control to such a complex material as copal. Further, the reaction of the varnish copals when admixed in varnish solution with various pigments with which they are used as intermediates, lends itself to much important work for the varnish chemist.

The next class of raw materials is the drying oils. The bulk of the drying oils used consist of linseed and china wood oil. The function of drying oils in varnish is to impart elasticity, flowing and application properties. Linseed oil is used more particularly in outside finishing varnishes, grinding varnishes in paint and linoleum, as well as oilcloth manufacture. The work of developing the qualities desired of linseed oil used in high-grade finishing varnishes has been a difficult task, at least for some of us. Linseed oil, properly prepared for such use, must have every trace of impurity removed. The acid value, or free fatty acid content, must be kept within accurate control. Certain minute quantities of semi-soluble waxes which find their way into the oil through foreign grass seeds gathered with the flax seed from which the oil is crushed, must be entirely removed. Other factors to be determined are the gravity, the iodine

number, which is an index of the drying qualities of the oil, the saponification number, a means of detecting a mineral oil if present, for mineral oils are not saponifiable, and also the free acid content, an important index to the manner in which the oil has been refined.

In drying, linseed oil as well as all other drying oils absorb oxygen from the air, and in doing so passes from a soluble liquid state to an insoluble plastic condition, and retains much of its original elasticity and also possesses an added desired toughness. These properties give linseed oil its value, when properly combined with selected copals, in the finished products. Still further the oil may be blown in bulk with air under slightly raised temperature, in which condition the oil absorbs oxygen rapidly, thus not only increasing the viscosity, but the drying ability also. Blown oils require but small quantities of dryers to hasten their final drying time. Kettle-boiled oils require much larger quantities of dryer. As these dryers, or metallic catalysers, all tend to turn the dried film dark in colour, the advantage of blown oils for any purposes may be readily appreciated.

In checking oxidised oils it is desirable to make determinations of viscosity, acid number, iodine and saponification numbers as well as the specific gravity. It will be found that as the oil continues to become oxidised the gravity and viscosity increase, whereas the other chemical figures decrease. The chemist is at a distinct advantage for he can keep the oil so treated within close control. The total amount by weight of oxygen which an oxidised pure linseed oil will absorb when completely oxidised represents an increase of between 16-18% over the original weight. The unsaturated bonds are then satisfied, and the oil is completely oxidised or expanded.

An intensely interesting material is china wood or tung oil. It is obtained from a seed grown on two species of tree, which grow in the south, central and western parts of China and blossom in the spring. The fruit ripens in the early fall, and is gathered before entirely ripened. The seeds, five to seven in number, are somewhat similar to Brazil nuts, but only one-third the size. The fruit, after being gathered, is placed in open iron pans and roasted just sufficiently to make them burst open. The seeds are then extracted, placed in a stone trough and ground. The ground mass is then further heated by a steaming process, and is then made up with straw into suitable size, and is pressed into cake in primitive oil presses made from hollowed logs. The yield of oil is about 40%: apparently 12% of oil is lost through inefficient methods of handling. The total annual output of this oil averages 700,000 piculs, a picul being equal to 133½ lb. Of this oil, U.S.A. and Canada import approximately 80%.

China wood oil resembles linseed oil in colour, but it has a much greater viscosity as well as a characteristic odour. Carefully refined linseed oils bleach practically water white when brought to a temperature of 525° F. China wood oil under similar conditions does not bleach. This factor is used in detecting adulterations in china wood oil. In its natural state china wood oil absorbs a maximum of 12-14% of its weight of oxygen. However, instead of drying in a clear film, the film of dried raw china wood oil is frosted and crystallised

throughout. In this condition, except in a few very special cases such as for frosted glass effects, china wood oil for varnish-making purposes is practically useless. When heated to a certain temperature the raw oil loses this characteristic drying feature, and if allowed to air dry, preferably with the addition of dryers in small amount, the oil will dry in a clear, hard and lustrous film. In this condition it has many of the properties of hard copals combined with linseed oil. In addition, the treated dried china wood oil film is extremely waterproof and weather-resisting.

China wood oil thus treated has this very extraordinary characteristic that instead of very gradually becoming more viscous as is the case with heat-treated linseed and other drying or semi-drying oils, china wood oil very quickly passes from a hot liquid state to a polymerised or solidified state. In this condition the oil becomes insoluble in varnish solvents, and is rendered again practically useless for varnish-making purposes. To find the best methods of manipulation of this oil in order to make it workable and still retain the desired features of the oil has been an endless study on the part of both the varnish maker and the chemist.

And here, as is the case with linseed oil, the chemist has much work of interest before him. Due to the early gross adulteration of the oil (it has been adulterated with soya bean, tea oil and other oriental oils), means had to be devised to check the purity of this oil. Heat tests under strict control were found to give the best indication of the purity of china wood oil. Strictly pure oil when heated, 100 g. at 287° C. for 6-6½ minutes in an open pan and kept constantly stirred, will solidify into a hard, pale, amber-coloured mass. If the oil is adulterated the time required for solidification will be retarded. An oil which requires 7½ to 8 minutes for solidification may be looked upon with suspicion. The actual time for solidification of pure oil after solidification commences equals but a few seconds. Adulterated oils solidify very slowly, depending, of course, on the degree of adulteration. An adulteration of 5% or over should not be left undetected. The chemical figures used in testing linseed oil are of equal importance in checking the purity of tung oil.

Lastly, we come to the solvents used. They are turpentine and mineral substitutes. The mineral substitutes are refined to a distillation range closely corresponding to that of turpentine. For many purposes they are just as satisfactory as turpentine itself. The usual procedure in testing them is for the chemist to carry out distillation and other desirable determinations. The presence of sulphur in substitutes must be avoided.

Thus the chemist plays an important part in the testing of finished products. Not only is this true for the manufacturer of varnish materials, but for those who are interested in the purchase of our products. Many of these finished materials are sold under specifications definitely designed through practical experience to meet certain needs and requirements. In this capacity the chemist has been an important factor in improvement of many materials, and in making it possible to keep these many products in a uniformly standard condition.

When all is said, we find the chemist the eyes of the work and an important factor in this branch of industry.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

ANNUAL GENERAL MEETING, July 4 to 8, 1927

ACCOMMODATION IN EDINBURGH.

Particulars of Hotels and University Hostels were given on page 105 of CHEMISTRY AND INDUSTRY for February 4.

In view of the fact that the available accommodation in Edinburgh for the week of the meetings is already largely booked, those who intend to stay at the North British Station Hotel (official headquarters of the Society during the meetings) or at one or other of the University Hostels are strongly recommended to arrange their accommodation *at once* through the Honorary Local Secretary of the Society, Dr. W. T. H. Williamson, 13, George Square, Edinburgh.

Accommodation to be reserved at any of the other hotels should be arranged *without delay* direct with the manager of the hotel.

TAR CONFERENCE PAPERS

The papers that were presented before the Manchester Tar Conference in November last have now been published in bound form at the price of 2s. 6d., post free.

Copies can be obtained from the General Secretary of the Society of Chemical Industry, Central House, Finsbury Square, London, E.C.2, and orders should be accompanied by the appropriate remittance.

BRISTOL SECTION

A joint meeting was held with the Fuel Section and the Chemical Engineering Group on February 3. Mr. George Gray presided over an excellent attendance, including visitors from London and members of the Bristol Association of Engineers. Messrs. J. W. Reber, M.I.Chem.E., and A. Scott presented a paper on "The production of power from town's refuse" (cf. CHEM. & IND., Feb. 11, p. 119).

An excellent discussion followed the paper, in which Messrs. Marsden, Rogers, Scorer, Broughall, Robertson, Gee, Watson, Dr. Smith, and others took part. On the proposal of Prof. Francis, seconded by Mr. Bernard, a hearty vote of thanks to the readers of the paper was carried with acclamation.

In the afternoon a visit was paid to the Union Street Works of Messrs. J. S. Fry & Sons. The party was conducted by Mr. Read and his assistants, and a most pleasurable time was spent. Tea was partaken by the kind invitation of Messrs. Fry & Sons.

After the evening meeting a successful informal dinner was held at Messrs. Hort's restaurant.

LONDON SECTION

A meeting was held under the chairmanship of Mr. C. S. Garland in the Chemical Society's Rooms on February 7, when Dr. T. Slater-Price, F.R.S., delivered an address on "Photographic sensitivity."

Dr. Slater-Price first described the constitution of the photographic emulsion, and pointed out that not only did the particles vary greatly in size, but the size distribution varied with different emulsions. There were many ways of making emulsions, and so there was considerable variation in the characteristics of the

grains or particles. An ordinary photographic plate contained anything between 500 and 5,000,000 grains per square inch of surface, so it could be understood how difficult was the investigation of the photographic plate. Dr. Slater-Price then considered the characteristic of various emulsions for plates and papers (both printing-out and development), and gave an account of some of the more recent theories of the action of light in relation to crystal structure.

TORONTO SECTION

Owing to an unfortunate change made in his plans by Prof. Cohen, the December meeting had to be suddenly cancelled.

At the meeting held on January 26, with Mr. Benson in the chair, an address was delivered by Dr. W. Blum, of the Bureau of Standards, Washington, D.C., U.S.A., President of the American Electrochemical Society.

Dr. Blum spoke on the electro-deposition of metals, pointing out the industrial significance as a means of refining, but more particularly he dealt with polarisation. The static potential of a metal is the potential when no current is passing. For commercial purposes it is much more important to know conditions during the passage of the current; hence our interest in changes at the electrodes. The potential changes to a dynamic potential when the current flows, and the difference between this and the static potential is the polarisation. Polarisation during electro-deposition may govern largely the applied voltage necessary to bring about electrolysis at a certain rate. It influences the structure, purity, and distribution of the deposited metal. The purpose of a scientific study of such phenomena is to predict and avoid useless experimentation.

A very interesting method of measuring polarisation was shown. A rectangular cell containing an anode and cathode, with two gauze electrodes of the metal between them, equally spaced, permits the direct measurement of the anodic and cathodic polarisation by determining the voltage drop, when a current is flowing between the gauzes themselves, and between the gauzes and the anode and cathode.

Anything increasing the concentration of the metal ion at the cathode will decrease the polarisation. Addition of such substances as glue and gelatin increases polarisation and influences the structure of the deposit. The measurement of the p_H value of solutions has become a matter of routine in plating plants, and is a most practical means of control.

Throwing power is bound up with cathode polarisation, conductivity, and cathode efficiency. To produce good throwing power in general, an effort is made to make it difficult for the metal to get on the nearest part of the cathode. By means of a series of slides it was shown that all electro-deposited metals are crystalline in form. The nature of the deposit depends on the factors surrounding the growth of these crystals. In general, it is advisable that chemists who have any contact with the plating industry should know the science of the subject, so that they can direct experimental work along the proper lines.

In the discussion which followed, some interesting points were brought out, one being the difficulty in

plating chromium owing to its poor throwing power, and it was shown that this cannot be avoided in any simple way. The question of the tendency in jewelry manufacture to plate a white-metal alloy with chromium was mentioned to indicate that in this line of business the potential relative values of the metals might not be the only factor to be considered. A piece of brass plated with chromium would give the same effect. Platinum-plating of jewelry is a matter of some importance to the public, since it is quite impossible for the average person to estimate the actual value of many articles of this kind.

CALENDAR OF FORTHCOMING EVENTS

- Feb. 19. BIRMINGHAM METALLURGICAL SOCIETY, Girls' High School, Dudley, at 7 p.m. "Blast furnace practice," by R. P. Bethell.
- Feb. 22. ROYAL PHOTOGRAPHIC SOCIETY, *Scientific and Technical Group*. 35, Russell Square, W.C.1, at 7 p.m. (1) "Turbidimetry and grain size," by F. E. Renwick, and "The Ferguson density comparator," by W. B. Ferguson.
- Feb. 22. INSTITUTION OF THE RUBBER INDUSTRY, *Sales Section*. Engineers' Club, Coventry Street, W.1, at 8 p.m. "Export selling," by Sir W. Clark.
- Feb. 22. MANCHESTER LITERARY AND PHILOSOPHICAL SOCIETY. Ordinary meeting. 36, George Street, Manchester, at 5.30 p.m. "Recent advances in the theory of colloids," by D. C. Henry.
- Feb. 23. SOCIETY OF CHEMICAL INDUSTRY, *South Wales Section*. Technical College, Mount Pleasant, Swansea.
- Feb. 23. GLASGOW UNIVERSITY ALCHEMISTS' CLUB, at 7.30 p.m. "Problems of chemotherapy," by Prof. C. H. Browning.
- Feb. 23. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. "Insulin and its manufacture," by F. H. Carr, C.B.E. Dr. Henry H. Dale, C.B.E., M.D., F.R.S., will preside.
- Feb. 24. SOCIETY OF CHEMICAL INDUSTRY, *Nottingham Section*. Joint meeting with the Midlands Section of the Society of Dyers and Colourists. University College, Nottingham, at 7.30 p.m. "A new view of soluble vat dyestuffs," by C. Shaw.
- Feb. 24. INSTITUTION OF MINING AND METALLURGY. *General Meeting*. Burlington House, Piccadilly, W.1.
- Feb. 24. OIL AND COLOUR CHEMISTS' ASSOCIATION. Rooms of the National Federation of Paint Manufacturers, 8, St. Martin's Place, Trafalgar Square, London, W.C.2, at 8 p.m. "Further notes on the behaviour of phenolic resins," by A. A. Drummond.
- Feb. 24. INSTITUTE OF BREWING. *North of England Section*. Midland Hotel, Manchester. "Recent work on the preservative principles of hops," by Prof. F. L. Pyman.
- Feb. 24. INSTITUTE OF BREWING, *Midland Counties' Section*. White Horse Hotel, Congreve Street, Birmingham, at 7.30 p.m. "Relationship of ready-formed soluble carbohydrates in malt to extract," by H. E. Dryden.
- Feb. 28. SOCIETY OF CHEMICAL INDUSTRY. *Joint meeting of the Yorkshire Section and the Fuel Section*. Queen's Hotel, Leeds, at 2.30 p.m. (See further particulars on p. 125 of the issue for Feb. 11, and p. 153 of this issue.)

THE INSTITUTION OF CHEMICAL ENGINEERS

On March 9 and 10, 1927, the Institution of Chemical Engineers will hold a Conference, followed by the Fifth Annual Corporate Meeting and Annual Dinner on March 11.

The programme of events will be as follows: On Wednesday, March 9, the First Session of the Conference will commence in the Chemical Society's Rooms, at 5 p.m., Sir Alexander Gibb, G.B.E., C.B. (Vice-President), in the chair. Papers will be presented on "The production of dissolved acetylene and its application to lead burning," by W. C. Freeman, and "Lead as a constructional material in chemical engineering," by S. J. Tungay. At 6.45 p.m. an informal dinner will be held at Stewart's Restaurant. The Second Session will begin at 8 p.m. with the President, Sir Frederic L. Nathan, K.B.E., in the chair. Papers on "The function of the Schmiedel box in sulphuric acid manufacture," by H. J. Bush and A. Grounds, and "Some improvements in chamber sulphuric acid plant," by W. G. Mills, will be read.

On Thursday, March 10, a visit will be paid to the Fuel Research Station, East Greenwich, leaving at 12.30 p.m., and returning at 4.30 p.m. to Burlington House, where tea will be served. Applications to join this party, which is limited to 50, should be made immediately. Members should make their own arrangements for lunch. At 5 p.m. the First Session will commence under the chairmanship of the President, a paper on "Rubber as a constructional material in chemical engineering," being read by Mr. B. D. Porritt. Informal dinner will follow at 6.45 p.m. at Stewart's Restaurant, and the Second Session will open at 8 p.m., Sir Alexander Gibb, G.B.E., C.B., in the chair. A paper will be presented by Prof. F. C. Lea, on "The effect of heat on some of the properties of metals."

On Friday, March 11, the Fifth Annual Corporate Meeting of the Institution will take place at the Hotel Victoria, Northumberland Avenue, W.C. 2, at 11.30 a.m. At 12 noon the President's Address on "Some industrial developments and the chemical engineer" will be delivered, followed at 12.45 p.m., by informal lunch. At 2.30 a paper will be read by F. H. Rogers, on "The Cross cracking process and plant." In the evening at 7.30 for 8 p.m. the Annual Dinner will be held in the Oak Room of the Hotel Victoria, when the President, Sir Frederic Nathan, K.B.E., will preside. The Right Hon. Sir Herbert Samuel, G.C.B., G.B.E., the Presidents of kindred institutions and societies, and other distinguished guests will be present. The price of the tickets is 12s. 6d. each, exclusive of wines. Members are cordially invited to bring ladies.

The President of the Institution and Council extend a cordial invitation to all gentlemen interested to attend, or to be represented at the Conference.

ROYAL SOCIETY OF ARTS

Mr. A. Chaston Chapman, F.R.S., presided over the meeting on February 9, when Dr. E. F. Armstrong, F.R.S., read a fascinating paper on "The romance of the organic chemical industry."

Dr. Armstrong first showed the infinite variety of the achievements of the chemist in elaborating products which but a generation ago were mainly laboratory

curiosities, but are now, or are about to be, produced in such quantities and at such price that they enter largely into the comfort of every citizen. The example of chemical achievement chosen was the aliphatic alcohols, and Dr. Armstrong described the search for cheaper sources of ethyl alcohol, such as raw material not suitable for food, formaldehyde made from calcium carbide, and ethylene. Passing to methyl alcohol, it was shown that unlimited quantities were now made synthetically at a much reduced cost, so that the way was clear to cheaper formaldehyde, and, consequently, to cheaper indigo and synthetic resins, with, perhaps, many new and far-reaching applications of formaldehyde.

Butyl alcohol, once a laboratory product, was found to be an excellent solvent for nitrocellulose, and so its manufacture was developed by the fermentation process, by a modification of the pressure process for methyl alcohol, and from acetylene. Isopropyl alcohol was already made from the gases produced in cracking petroleum, and butyl alcohol would undoubtedly be made by the cracking process. Next came amyl alcohol, produced in a crude form by the distillery, and a substitute would undoubtedly be produced by the pressure process.

The chemist had thus gone a long way to replace the older methods of making these alcohols by fermentation of edible materials by methods based on coal or carbide, i.e., electric power from water, or on petroleum, as raw materials. They could thus be produced in any desired quantity and at prices which brought them within the reach of wide industrial application, such as the growing manufacture of nitrocellulose lacquers.

These alcohols were used mainly as acetates, and therefore it was necessary to consider acetic acid. For many years the chief source of acetic acid was grey acetate of lime produced in the destructive distillation of wood, but the quantities did not suffice for war requirements, and alternative processes were worked out. That involving the oxidation of acetaldehyde, prepared from acetylene by the use of a mercury catalyst, had been brought to a stage of great perfection by the Canadian Electro-Products Company, a British achievement of which we should all be very proud. Progress continued, however, and ethyl acetate, even when made from fermentation alcohol and carbide acetic acid, was menaced by ethyl acetate made direct from acetaldehyde by condensation in presence of aluminium ethoxide. Further, the possession of cheap acetaldehyde bristled with possibilities. The addition to it of hydrogen cyanide and subsequent hydrolysis would result in the synthesis of lactic acid, a method which was under study.

Again, phthalic acid, once a curiosity, had been made cheaply and easily by the catalytic oxidation of naphthalene; the result was it became a raw material for the production of vat-dyes, for the production of a lacquer, and an artificial resin of exceptional electrical properties.

Concluding, Dr. Armstrong pointed the moral of the never-ending necessity for the encouragement of research, research directed to finding how to accomplish new things, or even old things in a novel manner. It was not enough to copy the achievements of the foreigner, even if in so doing we could go further—new work must be encouraged, even at considerable cost, irrespective of any question of immediate financial return.

CORRESPONDENCE

A NOVEL TYPE OF OPTICALLY ACTIVE COMPLEX METALLIC SALT

SIR,—Werner's conception of co-ordinated groups and of auxiliary valency has been extraordinarily useful in classifying and in elucidating the configurations of complex metallic compounds. Although many salts of this class, such as *tris*-ethylenediamine cobaltic chloride $[\text{Co}(\text{NH}_2\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{NH}_2)_3]\text{Cl}_3$, have been resolved into optically active components, no proof has hitherto been given that an auxiliary valency linking can render a carbon atom asymmetric. This interesting proposition has been now established by the further study of the recently described salt, tetrachloro-(triaminopropane monohydrochloride)-platinum.

obtained by the action of the $\alpha\beta\gamma$ -triaminopropane hydrochloride on chloroplatinic acid (Mann. Journ. Chem. Soc., 1926, 129, 2681).

In the new salt, the components, PtCl_4 and two of the NH_2 -groups with some of the associated carbon and hydrogen atoms, must lie inside the co-ordinated group, whilst the third NH_2 -group must protrude therefrom. It has now been found that the salt can be resolved into optically active components by the aid of silver *d*- and *l*-camphorsulphonate. The two salts, *l*-base *d*-acid and *d*-base *l*-acid, have thus been obtained in an optically pure state; the hydrochlorides regenerated from these salts give molecular rotations of -502° and $+501^\circ$ respectively for the mercury green line in aqueous solution at 15° .

It is therefore clear that the constitution of the hydrochlorides must be represented by the following formula—

In the above formula the enantiomorphism of configuration is associated with asymmetry of the middle or β -carbon atom of the triaminopropane molecule; this asymmetry arises from the attachment of the α - and β -amino-groups to the platinum atom by auxiliary valencies. This is the first case to be recorded in which asymmetry of a carbon atom results from the operation of auxiliary valencies.

The new type of molecular enantiomorphism now disclosed will no doubt appear among numerous complex metallic compounds, and, indeed, a complex copper salt analogous in constitution to the above platinum salt has been already prepared (*loc. cit.*). We are now engaged on the further investigation of these and other related compounds.

University of Cambridge. February 7

THE TESTING OF DISINFECTANTS

SIR,—We have perused with some interest the article in your issue of December 31 last on the testing of disinfectants by the Rideal-Walker method and the subsequent letters in regard to it. As originators of the test and as consultants who have tested practically every disinfectant on the market we feel disposed to make a few remarks on the subject.

It has also been our experience that certain other investigators are unable to obtain the correct coefficient value, but upon close investigation we have invariably found that they had not adhered closely to the published standard technique of the test. We may say further that coefficients above 20·22 for a coal-tar disinfectant have rarely been certified by us.

While recognising that the results obtained with broth standardised by different methods are of some theoretical scientific interest, we cannot help feeling that there have been many attempts in the past to create difficulties where they do not exist. In fact we can see no incontestable reason for neutralising the broth at boiling point using phenolphthalein, and we maintain that it is quite incorrect on general scientific grounds to dilute the broth before titration.

Both in this country and in America there have been a very considerable number of investigations on the question of the optimum or the most suitable p_H for the broth. All methods of adjusting the p_H of the broth are affected by the proteins, and this is true for the hydrogen electrode as well as for indicators. In the case of the hydrogen electrode poisoning due to adsorption of the proteins is so marked as to render the method difficult in the research laboratory and certainly impracticable for a routine method. The indicator method, although vitiated both by a salt and protein effect, is by far the most convenient, and when one indicator is used a definite p_H is always obtained, since the protein and salt content of the media do not vary, although the p_H may not be the true thermodynamic p_H .

Apparently Mr. Moore agrees that an indicator method is preferable. In actual practice, of course, phenolphthalein is used and the neutralisation is effected cold. The reaction of such a broth is p_H 7·6, a value in good agreement with that calculated from the limiting conditions of phenolphthalein and the salt effect, *i.e.*,

$$7\cdot80 - 0\cdot16 = 7\cdot64.$$

We have been using such a medium for many years, and have in our possession samples of disinfectants upwards of 20 years old. These we occasionally test for the sake of experiment and interest, and we have no difficulty in obtaining results well within the generally recognised limits of accuracy of the test.

Mr. Moore's positive recommendation appears to be to alter the p_H from 7·6 to 7·0. This could readily be done, of course, by using some other indicator, but Mr. Moore apparently forgets that by doing so we should be rendering an enormous amount of work incomparable without any very obvious gain in other directions.

Yours faithfully,
S. & E. K. RIDEAL & A. SCIVER

28, Victoria Street,
Westminster, S.W.

AN ABSORBENT FOR OXYGEN

SIR,—If Messrs. Hartschorn and Spencer have any information about the action of carbon monoxide on their chromous chloride—amalgamated zinc mixture, this would form a useful addition to their communication published on December 31 (p. 474 T).

An absorbent which will take up oxygen *rapidly* from mixtures with carbon monoxide would be very welcome for the analysis of the flue gases from boiler and other furnaces, especially an absorbent which so conveniently regenerates itself.

Yours faithfully,
H. F. TAYLOR

PERSONAL AND OTHER ITEMS

The Home Secretary has appointed Dr. G. Roche Lynch, M.B., to be Senior Official Analyst to the Home Office, in succession to the late Mr. John Webster. Since 1920 Dr. Lynch has held the appointment of Junior Official Analyst to the Home Office.

Prof. F. G. Banting has been awarded the Cameron prize of the University of Edinburgh in recognition of his investigations on insulin and on the treatment of diabetes.

Dr. Wilson Baker has resigned his post as lecturer in chemistry in the University of Manchester on his appointment to a demonstratorship at Oxford.

Mr. J. B. M. Herbert, B.Sc., has been appointed lecturer in chemistry in the University of Manchester.

The Sir John Cass Technical Institute is celebrating its 25th anniversary on February 21, when the Institute will be open for inspection. Exhibits and demonstrations will be given by students and manufacturers of scientific and other apparatus.

The late Prof. Sir William Tilden, F.R.S., left £6461, with net personalty £3315.

We regret to announce the death of Sir James Kennal, managing director of the well-known firm of engineers, Messrs. Babcock & Wilcox.

Fuel Problems

Attention is drawn to the joint meeting of the Fuel Section and the Yorkshire Section on February 28, at Leeds, of which the full programme was given in our last issue (CHEM. & IND., February 11, p. 125). It should be noted firstly that the paper on "Coke in relation to some of its industrial and domestic uses" is by Mr. H. Hollings, M.Sc., and Mr. N. E. Siderfin, M.Sc., and, secondly, that the papers will be published in the forthcoming (February 25) issue of the JOURNAL OF THE SOCIETY OF CHEMICAL INDUSTRY, so that the notice regarding preprints is cancelled.

Cleansing White Waterproof Coats

In view of the difficulty of finding an efficient and harmless method of cleansing white waterproof coats, the *India-Rubber Journal* has decided to offer a prize of three guineas for the most satisfactory method submitted. The closing date for entries for the competition will be March 19, and all entries should be addressed to The Editor, *India-Rubber Journal*, 37 and 38, Shoe Lane, London, E.C.4, and marked on

the outside of the envelope "White Waterproofs." Entrants will be required to state over their signatures that there is not to their knowledge any proprietary right in the process which they recommend. Arrangements will be made by the Editor for the testing by trade experts of the various methods submitted and that adjudged best will be published in the *India-Rubber Journal*, with the least possible delay. In the event of no really satisfactory method being propounded, the prize money will be allocated to one of the trade association funds at the Editor's discretion.

COMPANY NEWS

SOUTH METROPOLITAN GAS CO., LTD.

The report for 1926 shows increased sales of gas, the revenue therefrom amounting to £3,307,135, compared with £3,019,673 for 1925, whilst by-products gave £1,109,606, as against £992,147. The cost of coal rose from £1,663,769 to £2,008,899, and the total expenditure from £3,954,712 to £4,400,185, leaving a net profit of £437,486, compared with £471,565. A withdrawal of £98,000 is made from the special purposes fund, and this, with interest received £1,989, and £8,144 brought in, makes available £545,620. Interest charges absorb £146,851, and a final dividend is proposed of $3\frac{1}{2}\%$, making 6% placing £66,099 to the co-partnership fund.

BORAX CONSOLIDATED, LTD.

The accounts for the year to September 30, 1926, show a net profit of £387,858, compared with £425,111 for the previous year. A final dividend has been recommended of 1s. 3d. per share ($6\frac{1}{4}\%$), less tax at 4s., on the deferred ordinary shares, making 10% for the year ended September 30, 1926, compared with a total dividend of $12\frac{1}{2}\%$ for the previous year. The various allocations have been maintained, and the carry forward increased from £196,629 to £219,022.

WALKERS, PARKER AND CO., LTD.

A final dividend has been declared for 1926 on the fully-paid ordinary shares of $7\frac{1}{2}\%$, plus a bonus of $1\frac{1}{4}\%$, making $11\frac{1}{4}\%$. The dividend on the 15s. paid ordinary shares will be at the same rate, or 1s. 3 $\frac{1}{4}$ d. per share.

ASSOCIATED FIRECLAY COMPANIES

The report for 1926 shows a net profit of £35,887, less income tax £5,804, leaving £30,083. A final dividend has been declared on the ordinary shares of 4% (free of tax), making 8%, leaving £11,358 to be carried forward.

BRADFORD DYERS' ASSOCIATION

The profits for the year ended December 31 last amounted to £550,714, compared with £680,940 for 1925 and £944,111 for 1924. With the balance brought forward, there is an available sum of £1,105,730, against £1,338,585. After providing for debenture interest and depreciation, a final dividend is recommended of 1s. per share on the ordinary capital, making 10%, less tax, for the year, compared with $13\frac{1}{2}\%$ for the previous year, leaving £480,630 to be carried forward.

JURGENS, LTD.

A dividend has been declared for the half-year to December 31, 1926, on the guaranteed 7% cumulative participating preference shares at 7% per annum, less tax at 4s. in £, payable on February 1.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
Bisulphite of Lime—£7 10s. per ton, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots. ●
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
Copper Sulphate.—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal., 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammoniac.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included. Sod. Chlorate.—2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
Arsenic, Sulphide, Yellow.—2s. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 2d. per lb.
Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
Lamp Black.—£35 per ton, barrels free.
Lead Hyposulphite.—9d. per lb.
Lithophone, 30%.—£22 10s. per ton.
Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
Sulphur Chloride.—4d. per lb., carboys extra.
Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
Vermilion, pale or deep.—5s. 3d. per lb.
Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 per ton. Scarce. Grey, £17 5s. per ton. Liquor, 9d. per gal. 32° Tw.
Charcoal.—£8 5s.—£10 per ton and upwards, according to grade and locality.
Iron Liquor.—1s. 6d. per gal. 32° Tw.; 1s. 2d. per gal. 24° Tw.
Red Liquor.—10d.—11d. 16° Tw. per gal.
Wood Creosote.—1s. 9d. per gal., unrefined.
Wood Naphtha.—Miscible, 3s. 10d.—4s. per gal., 60% O.P. Solvent, 4s. per gal., 40% O.P.
Wood Tar.—£4—£5 per ton and upwards, according to grade.
Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carbohc.—Crystals, 6½d. per lb. Crude 60's, 1s. 8½d.—1s. 9½d. per gal.
Acid Cresylic, 99/100.—2s. 3d.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 1d. per gal. Pale, 95%, 1s. 10d.—2s. per gal. Dark, 1s. 9d.—1s. 10d. per gal.
Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
Benzole.—Crude 65's, 1s. 3d.—1s. 4d. per gal., ex works in tank wagons; Standard motor, 1s. 11d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s. 2d.—2s. 5d. per gal., ex works in tank wagons.
Toluene.—90%, 1s. 11½d. to 2s. 3d. per gal. Firm. Pure, 2s. 2½d.—2s. 6d. per gal.
Xylol.—2s. 3d.—2s. 6d. per gal. Pure, 4s. per gal.
Creosote.—Cresylic 20/24%—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal.
Naphtha.—Crude, 9½d.—1s. 0½d. per gal., according to quality. Solvent 90/160, 2s.—2s. 1d. per gal. Solvent 95/160, 1s. 9d.—1s. 10d. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s. per ton.
Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
Pitch, medium soft.—107s. 6d.—120s. per ton, f.o.b. according to district.
Pyridine.—90/140.—9s. 6d.—13s. per gal. Nominal. 90/180 —7s. 6d. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered price include packages except where otherwise stated.

Acid Gamma.—8s. per lb.
Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
Acid H.—3s. 3d. per lb. 100% basis d/d.
Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7d. per lb., naked at works.
 Aniline Salts.—7d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzedine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d.—4½d. per lb.
 m-Cresol 98/100%.—2s. 8½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 a-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 a-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—7d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 4d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xylidine Acetate.—2s. 11d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4d.—2s. 5d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots—1s. per oz.
 Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 3½d. per lb. Less 5%. Market still weak.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4d.—1s. 5d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 0½d. per lb. Less 5%. Very firm market.
 Amidol.—9s. 6d. per lb. d/d.
 Acetanilide.—1s. 7d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—11s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Aspirin.—2s. 4d. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.
 Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr. paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 4d.—2s. 5d. per lb. Potassium.—1s. 11d.—2s. per lb. Sodium.—2s. 2d.—2s. 3d. per lb. All spot.
 Calcium Lactate.—1s. 4d.—1s. 5d. per lb.
 Chloral Hydrate.—3s. 3d.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ether meth.—1s. 1d.—1s. 1½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—6s. 6d.—7s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 8d. per gal. f.o.r. makers' works, naked.
 Hydroquinone.—4s. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—22s. per cwt., 112 lb. lots.
 Magnesium Carbonate.—Light Commercial £33 per ton net.
 Magnesium Oxide.—Light Commercial £87 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 10s. 6d.—12s. per lb., according to quantity; Liquid (95%), 12s. per lb. Detached cryst., 14s. 6d. per lb.
 Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb., Levig. 6s. 1d. per lb.; Corrosive sublimate, Lump, 4s. 8d.—4s. 10d. per lb., Powder, 4s. 3d. per lb.; White precip., Lump, 4s. 10d.—5s. per lb., Powder, 5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d. per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide, 5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d. per lb.; Sulph. nig., 4s. 10d.—4s. 11d. per lb.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonat.—15s. 6d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—3s. 9d.—4s. per lb.
 Phenazone.—5s. 9d.—6s. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 86s. per cwt., less 2½% for ton lots.
 Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
 Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6½d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins.
 Resorcin.—4s.—4s. 3d. per lb. spot.
 Saccharin.—55s. per lb.
 Salol.—3s.—3s. 3d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—77s. 6d.—82s. 6d. per cwt. net, according to quantity.

Sod. Salicylate.—Powder, 1s. 9½d.—1s. 10½d. per lb.; Crystal 1s. 10d.—1s. 11d. per lb.
Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.
Sulphonol.—10s. 6d. per lb.
Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
Thymol, Puriss.—11s. 9d.—13s. 9d. per lb., according to quantity. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.
Aubepine (ex Anethole).—10s. 6d. per lb.
Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb.
 Amyl Salicylate.—3s. per lb.
Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.
Cinnamic Aldehyde.—Natural, 17s. per lb.
Coumarin.—11s. per lb.
Citronellol.—15s. per lb.
Citral.—9s. 6d. per lb.
Ethyl Cinnamate.—10s. per lb.
Ethyl Phthalate.—3s. per lb.
Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—19s. per lb.
 Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Shui Oil) 12s. per lb.—(ex Bois de Rose) 16s. per lb.
 Linalyl Acetate.—(ex Shui Oil) 14s. 6d. per lb.—(ex Bois de Rose) 18s. per lb.
Methyl Anthranilate.—9s. per lb.
Methyl Benzoate.—4s. 6d. per lb.
Musk Ketone.—36s. per lb.
Musk Xylol.—8s. 6d. per lb.
Nerolin.—3s. 9d. per lb.
Phenyl Ethyl Acetate.—12s. per lb.
Phenyl Ethyl Alcohol.—11s. per lb.
Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 6d. per lb. Vanillin.—19s. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—30s. per lb. Bourbon Geranium.—11s. 3d. per lb.
Camphor.—63s. 6d. per cwt. Cananga, Java, 20s. per lb.
 Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure.—6s. per lb.
Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 20s. 9d. per lb. Lemon.—9s. 6d. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. per lb.
 Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 22s. per lb. Japanese, 8s. 9d. per lb. Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The Complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Apr. 9th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Feb. 24th. Complete Specifications marked* are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Blair. Centrifugal separators. 2932. Feb. 1.
 Cooper, Henshaw, and Holmes & Co. Drying gases. 3354. Feb. 5.
 Dunlop and Sibbald. Machines for expressing liquids from solids. 3180. Feb. 4.
 Garland and Pickard. Edge filtration. 2766. Jan. 31.

Hadamovsky. Heating, evaporating, or cooling vessel etc. 3116. Feb. 3. (Ger. 3.2.26.)
 Lowe, Podmore, and Manchester Furnaces, Ltd. Furnaces. 3017. Feb. 2.
 Marx. 3099. See XXIII.
 Mille. Furnaces. 3077. Feb. 3. (Fr., 22.9.26.)
 Norsk Hydro-Elektrisk Kvaestofak. Purification of gases. 3009. Feb. 2. (Norway, 25.2.26.)
 Roucka. Furnaces. 2947. Feb. 2. (Ger., 4.8.26.)
 Rowlands. Centrifugal separating and filtering apparatus. 2948. Feb. 2.
 Tittel. Fire-extinguishing composition. 2753. Jan. 31.
 Vallez. Filters. 2921. Feb. 1.
 Woodall-Duckham (1920), Ltd., and Wilkins. Furnaces. 2868. Feb. 1.

I. Complete Specifications

21,292 (1925). Vermeyen. Furnaces. (230,206.)
 26,938 9 (1925). Martin and Taylor. Furnaces. (264,919 20.)
 26,944--5 and 27,194 (1925). Stothert & Pitt, Ltd., and Minty. Drying machines. (264,921—2 and 264,931.)
 27,320 (1925). King, Tandevin, and Gregson, Ltd., and Nelson. Furnaces. (264,938.)
 28,324 (1925). Jones. Emulsification. (264,955.)
 32,586 (1925). Johnson (L-G. Farbenind.). Packings for apparatus working at high pressures. (264,988.)
 19,089 (1926). Davis. Drying and grinding wet materials. (265,070.)
 19,448 (1926). Simmonds. Mixing-apparatus. (265,073.)
 *18,033 (1926). Berton & Co. Machine for distilling water-containing products, particularly sugar solution. (265,127.)
 *2270 (1927). Mercier. Apparatus for condensing vapours and extracting non-condensable gases. (265,199.)

II. Applications

Dehn (Schuster). Treating oils etc. 2800. Jan. 31.
 L-G. Farbenind. 2745. See XX.
 International Combustion Engineering Corp. Apparatus for low-temperature distillation of coal. 3036. (U.S. 1.3.26.)
 Johnson. Production of carbon. 3236. Feb. 4.
 Lessing. Heat treatment of briquettes. 2801. Jan. 31.
 Norsk Hydro-Elektrisk Kvaestofakt. 3009. See I.
 Petroff. Treating mineral and naphtha oils. 2892 and 2896. Feb. 1.
 Wellman Smith Owen Engineering Corp., Ltd., and Kemp. Gas producers. 3309. Feb. 5.

II.—Complete Specifications

10,444 (1926). De Bataafse Petroleum Maatsch. Distillation of petroleum etc. (253,489.)
 11,945 (1926). McCormick. Apparatus for distilling carbonaceous materials. (265,046.)
 20,280 (1926). France. Plant for washing coal etc. (265,077.)
 *2294 (1927). Hoyois. Washing coal, ores, etc. (265,202.)
 *2312 (1927). Espes. Apparatus for detecting carbon monoxide. (265,207.)
 *2574 (1927). Tonmin. Carbonising coal. (265,228.)
 *2745 (1927). L-G. Farbenind. See XX.

III.—Application

Rogers (Kirschbraun). 2751. See IX.

IV. Applications

British Dyestuffs Corp., Cliffe, Linch, and Rodd. 3341. See XX.
 British Dyestuffs Corp., Davidson, and Shepherdson. Manufacture of anthraquinone derivatives. 3339. Feb. 5.
 British Dyestuffs Corp., and Simmonds. Manufacture of triarylmethane dyes. 3340. Feb. 5.

Carpmael (I.-G. Farbenind.). Manufacture of triaryl-methane dyestuffs. 2924. Feb. 1. Manufacture of vat dyestuffs. 3135. Feb. 3. Manufacture of 2·7-dinitroanthraquinone. 3243. Feb. 4.

Gardner. Treatment of dyestuffs etc. 3350. Feb. 5.

Scottish Dyes, Ltd., Anderson, Thomas, and Thomson. Production of benzanthrone derivatives. 3050. Feb. 2.

IV.—Complete Specifications

27,339 (1925). Zinke. Manufacturing dyestuffs. (242,306.) 8519 (1926). Johnson (I.-G. Farbenind.). See XIII.

*2186 (1927). I.-G. Farbenind. Manufacture of phthaloyl-2:3-thionaphthene and derivatives. (265,193.)

*2299 (1927). Geigy A.-G. Manufacture of mordant dyestuffs. (265,203.)

*2553 (1927). I.-G. Farbenind. Manufacture of isatins and N-arylsulpho-compounds thereof. (265,224.)

*2667 (1927). I.-G. Farbenind. Manufacture of vat dyestuffs. (265,232.)

V.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of artificial silk. 3041. Feb. 2.

Marks (Du Pont Visceloid Co.). Fire-proof products etc. 2890. Feb. 1.

V.—Complete Specifications

23,322 (1925). Ellis (Soc. Fabr. Soie Rhodiaseta). Apparatus for the manufacture of artificial silk. (264,708.)

27,153 (1925). Rushton. Manufacture of artificial silk. (264,929.)

27,309 (1925). Dreyfus. Manufacture of cellulose derivatives. (264,937.)

13,866 (1926). Jackson (Robinson Fiber Corp.). Treatment of paper-pulp stock. (265,055.)

VI.—Application

Gardner. Dyeing. 3351. Feb. 5.

VI.—Complete Specifications

15,395 (1925). Dreyfus. Manufacture of acetic acid. (264,558.)

27,308 (1925). British Celanese, Ltd., and Ellis. Treatment of yarns and fabrics. (264,936.)

29,780 (1925). Dehn (Stein Fur Dyeing Co.). Bleached and dyed furs. (264,969.)

31,049 (1926). Sallmann. Production of a smooth dull surface in dyed textile fabrics. (262,783.)

VII.—Applications

Robson. Preparation of sulphate of ammonia. 3110 and 3153. Feb. 3.

Vidal (Riedel A.-G.). Production of hydrogen peroxide. 3204. Feb. 4.

VII.—Complete Specifications

24,309 (1925). Commonwealth White Lead & Paints Proprietary, Ltd. See XIII.

28,185 (1925). Tennant (N. V. Philips' Gloeilampenfabrieken). Deposition of boron in coherent form. (264,953.)

9204 (1926). Marks (American Smelting & Refining Co.). See X.

*14,274 (1926). Roessler & Hasslacher Chemical Co. Manufacture of sodium peroxide. (265,124.)

*15,138 (1926). Cerini. Apparatus for purifying solutions of caustic soda etc. (265,126.)

*26,917 (1926). Oesterreichische Chem. Werke. Production of persulphuric acid and its salts. (265,141.)

*1885 (1927). Tardan. Manufacture of lead monoxide. (265,190.)

VIII.—Application

Withers (Vitrefrax Co.). Refractory compositions. 2881. Feb. 1.

VIII.—Complete Specification

2268 (1925). Hope. Manufacture of vitreous masses. (261,550.)

IX.—Applications

Curtin. Preserving wood. 2789. Jan. 31.

Kelly. Waterproof cement etc. 2726. Jan. 31.

Rogers (Kirschbraun). Process of making bitumen etc. emulsions. 2751. Jan. 31.

IX.—Complete Specification

*2309 (1927). Montan, Inc. Impregnating wood. (265,206.)

X.—Applications

Arrowsmith. Manufacture of steel. 2716. Jan. 31.

Ashcroft. Treating slags etc. 3119. Feb. 3.

Coley. Manufacture of zinc. 3016. Feb. 2.

Cruse. Reduction of metal etc. 3052. Feb. 3.

Dicker (N.V. Philips' Gloeilampenfabr.). Soldering metals etc. 2770. Jan. 31.

Fairweather (Nybergs Grufaktiebolag). Reducing ores. 2795. Jan. 31.

2 Fallon and Smallwood. Furnaces for heat treatment of metals. 2722. Jan. 31.

Johnson (I.-G. Farbenind.). Manufacture of finely-divided metals. 3235. Feb. 4.

Laebrecht. Electrodeposition of chromium. 2884. Feb. 1.

Woodward. Heat treatment of steel. 2841. Feb. 1.

X.—Complete Specifications

18,582 (1925). Smith. Extraction of lead. (261,569.) 9204 (1926). Marks (American Smelting and Refining Co.). Recovery of zinc and zinc compounds. (265,036.)

12,286 (1926). Hoorn. Removing hydrogen from the surface of metal objects to be coated by electrolysis. (265,047.)

*153 (1927). Krupp Grusonwerk. Working-up complex ores and metallurgical products. (265,162.)

*546 (1927). Aluminium Industrie A.-G. Manufacture of aluminium. (265,170.)

*2294 (1927). Hoyos. See II.

*2431 (1927). Kaiser-Wilhelm-Institut für Eisenforschung. Purification of metals. (265,213.)

XI.—Applications

2 Forgrove Machinery Co., Ltd., and Grover. Selenium cells. 2735. Jan. 31.

Laebrecht. 2884. See X.

Meyer and Spanner. Incandescent cathode for electric discharge tubes. 3270. Feb. 4. (Ger., 9.6.26.)

Pechkranz. Electrodes. 3227. Feb. 4. (Switz., 5.2.26.)

Postlethwaite, and Siemens Bros. & Co. Dry batteries. 2742. Jan. 31.

XI.—Complete Specifications

27,005 (1925). Siemens-Schuckertwerke. Electric furnaces. (244,426.)

29,826 (1925). Edison Swan Electric Co., and Webster. Electric accumulators. (264,970.)

1425 (1926). Fuller's United Electric Works Ltd., and Whaite. Electric accumulators. (265,000.)

12,286 (1926). Hoorn. See X.

29,284 (1926). General Electric Co., Ltd. Manufacture of filaments for electric incandescent lamps. (265,113.)

XII.—Applications

Dehn (Schuster). 2800. See II.

Petroff. Production of emulsifiable etc. preparations. 2890 and 2894. Feb. 1. Splitting of fats, oils, etc. 2895. Feb. 1.

XII.—Complete Specifications

*30,408 and 30,469 (1926). Henkel & Cie. Manufacture of a glycerin poor in polyglycerins and containing diglycerin. (265,146—7.)

*2429 (1927). I.-G. Farbenind. Extracting vegetable oils. (265,212.)

XIII.—Applications

Coles. Production of white lead. 3177. Feb. 4.

Petroff. Production of phenolic condensation products. 2893. Feb. 1.

XIII.—Complete Specifications

24,309 (1925). Commonwealth White Lead and Paints Proprietary, Ltd. Manufacture of lead compounds. (249,809.)

8519 (1926). Johnson (I.-G. Farbenind.). Manufacture of colour lakes. (265,032.)

8659 (1926). Jarny. Manufacture of condensation products from phenols and formaldehyde. (265,033.)

9037 (1926). Jackson (New Jersey Zinc Co.). Zinc sulphide pigment. (250,581.)

13,044 (1926). British Thomson Houston Co., Ltd. Resinous condensation products. (252,394.)

14,481 (1926). Koelman. Producing acid-proof adherent and repairable coatings from artificial resins. (253,531.)

XIV.—Applications

Butler. Liquidised crude rubber. 3039. Feb. 2.

Naugatuck Chemical Co. Treating latex etc. 2764. Jan. 31. (U.S., 243,26.)

XIV.—Complete Specification

509 (1927). Roessler and Hasslacher Chemical Co. Accelerators for vulcanisation of rubber. (265,169.)

XV.—Applications

British Glues and Chemicals, Ltd., and Drew. Process for degreasing bones etc. 3151. Feb. 3.

Tassel, and Van Tassel Co. Waterproofing leather etc. 2790. Jan. 31.

XVI.—Complete Specification

*2218 (1927). Rhenania-Kunheim Verein Chem. Fabr. Ges. Manufacture of chemical manures. (265,197.)

XVII.—Application

Berten & Co. (Ges. Apparatus for boiling and evaporating sugar solution 2767. Jan. 31. (Ger., 12,11,26.)

XVII.—Complete Specification

*18,033 (1926). Bertin & Co. See I.

XVIII.—Application

Hansana A.-G., and Nathan. Vessels for fermentation purposes. 3356. Feb. 5. Pasteurising beer. 3357. Feb. 5.

*XVIII.—Complete Specification

23,580 (1925). Fuller. Artificial malt product for brewing and bread-making. (264,890.)

XIX.—Complete Specification

23,580 (1925). Fuller. See XVIII.

XX.—Applications

Bhisey. Manufacture of eau-de-Cologne. 3159. Feb. 1.

British Dyestuffs Corp., Cliffe, Linch, and Rodd. Obtaining derivatives of diaryl ketones. 3341. Feb. 5.

Carpmael (Chem. Fabr. vorm. Schering). Manufacture of metallo-mercapt compounds. 3042. Feb. 2. Manufacture of anhydrides of acetic acid etc. 3244. Feb. 4.

Claasen. Production of ester mixtures. 3020. Feb. 2.

I.-G. Farbenind. Manufacture of esters. 2744. Jan. 31. (Ger., 29,1,26.) Production of organic compounds from hydrocarbons. 2745. Jan. 31. (Ger., 29,1,26.) Manufacture of condensation products from naphthalene etc. 3134. Feb. 3. (Ger., 4,2,26.)

Imray (I.-G. Farbenind.). Manufacture of 1-phenyl-3-methyl-5-pyrazolone. 3327. Feb. 5.

Marks (Parke, Davis and Co.). Immunising product etc. 2788. Jan. 31.

Petroff. Separating and purifying sulpho-acids. 2891. Feb. 1.

Soc. Anon. Prod. Chim. Coverlin, and Bots. Manufacturing vanillin. 3022. Feb. 2. (U.S., 25,5,26.) Manufacturing iso-eugenol. 3023. Feb. 2. (U.S., 25,5,26.)

XX.—Complete Specifications

15,395 (1925). Dreyfus. See VI.

15,621 (1925). Chem. Works (Sandoz). Making allium preparations for medical use. (235,883.)

*440 (1927). Chem. Fabr. (vorm. Schering). Manufacture of hormone from the sexual organs. (265,166.)

*441 (1927). Chem. Fabr. (vorm. Schering). Manufacture of derivatives of 2-aminopyridine. (265,167.)

*2744 (1927). I.-G. Farbenind. Manufacture of esters. (265,233.)

*2745 (1927). I.-G. Farbenind. Production of valuable organic compounds from gaseous or vaporous hydrocarbons. (265,234.)

XXI.—Applications

Bawtree. Photographic image, and means for producing same. 3279. Feb. 1.

Frost. Reproduction of photographic images. 3010. Feb. 2.

Green. Manufacture of photographic etc. films. 2805. Jan. 31.

Loeb and Wreschner. Manufacture of preparation emitting β -rays. 3133. Feb. 3. (Ger., 8,2,26.)

Schwickert. Producing diazo-type paper. 3249. Feb. 4. (Ger., 4,10,26.)

XXI.—Complete Specification

17,165 (1926). Imray (I.-G. Farbenind. A.-G.). Silver halide emulsion. (255,846.)

XXII.—Complete Specification

8086 (1926). Bombini Parodi-Delfino, and Benelli. Manufacture of explosives. (265,029.)

XXIII.—Applications

Magrath. Treatment of water for softening etc. purposes. 3335. Feb. 5.

Marx. Clarification of fluids etc. 3009. Feb. 3.

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*British India*: Copper ingots (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Canada*: Druggists' specialities (129); Pulp machinery (B.X. 3211). *Chile*: Galvanised iron sheets, sheet and bar brass, copper, lead and zinc (C.X. 2183). *Dutch East and West Indies*: Galvanised corrugated and flat steel sheets (150). *Egypt*: Nitrate of soda, nitrate of lime, sulphate of ammonia, superphosphate of lime (C.X. 2196). *France*: Artificial silk yarns (136); rubber goods (138). *Holland*: Linoleum (145). *Rumania*: Tinplate, black sheets, terneplates, galvanised sheets, tin, etc. (146).

PUBLICATIONS RECEIVED

REPORT ON THE FERMENTATION INDUSTRIES FOR 1926. Prepared for the Society of Chemical Industry and the Institute of Brewing. By H. Lloyd Hind, B.Sc. Pp. 37.

Messrs. Crosby Lockwood & Son announce that Dr. Geoffrey Martin's comprehensive treatise on "The modern soap and detergent industry" has been translated and published in Russian.

JOURNAL of THE SOCIETY OF CHEMICAL INDUSTRY CHEMISTRY & INDUSTRY

Official Organ of the Institution of Chemical Engineers of the Coke Oven Managers' Association, and of the Federal Council of Pure and Applied Chemistry

which consists of Representatives from

The Chemical Society, the Society of Chemical Industry, the Association of British Chemical Manufacturers, the Institute of Chemistry, the Society of Public Analysts, the Faraday Society, the Institute of Brewing, the Society of Dyers and Colourists, the Society of Glass Technology, the Iron and Steel Institute, the Ceramic Society, the Institution of Gas Engineers, the Society of Leather Trade Chemists, the Royal Photographic Society, the Mineralogical Society, the Biochemical Society, the Oil and Colour Chemists' Association, the Institute of Metals and the Royal Agricultural Society.

LONDON, FEBRUARY 25, 1927

No. 8

EDITORIAL

You Never Can Tell

IT is very difficult to know which new facts are likely to be of value to mankind; much is published, and some of it is of value. Even the experts cannot be sure that the grain has been separated from the chaff. About the year 1845 a certain Waterston sent to the Royal Society a long paper in which he claimed that some of the properties of gases could be explained by assuming that these contained molecules rushing about in all directions and rebounding from each other and from the walls of the vessel containing the gases. The learned referee turned it down as preposterous. Afterwards Clerk Maxwell and other people put forward the same hypothesis, and by more or less of an accident Waterston's paper was rescued from oblivion by Lord Rayleigh and published nearly fifty years after it was prepared. We think that many people would have considered that the spectroscopic examination of such substances as cholesterol and ergosterol could hardly be of any practical value; they would have been wrong. We had the pleasure, in our issue of December 10 last, of publishing notices of two papers. In the one, Messrs. Rosenheim and Webster showed that the vitamin D obtained by exposing cholesterol to ultra-violet light was not derived from cholesterol, but from a substance usually associated with it: in the other, Messrs. Heilbron, Kamm and Morton showed that a substance associated with cholesterol had three well-defined bands in its spectrum which disappeared on exposure to ultra-violet light. More recently Messrs. Windaus, Heilbron and his colleagues, and Rosenheim and Webster, all making use of each other's ideas and knowledge, have been investigating ergosterol, and it has been shown that the parent substance of vitamin D is either ergosterol or a highly unsaturated sterol of similar constitution. This extremely important fact is announced in a paper by Messrs. Rosenheim and Webster which appeared in the *Lancet* on February 5. We learn from a more recent number of the *Lancet* that the British Drug Houses, Ltd., can now supply an activated ergosterol solution which is far more potent than any cod-liver oil: about half a cubic centimetre of a 0.1% solution is all that is required for a daily dose. Whether they

make the substance from ergot or yeast we do not know. Ergosterol can be prepared from either. The production of vitamin D, the anti-rachitic vitamin, from the so-called cholesterol, was independently discovered by Rosenheim and Webster here, and by Steenbock and others in America. According to the *Daily Mirror* Prof. Steenbock proposes to reveal gratuitously his method of isolating vitamin D, and has refused a sum which would have made him rich beyond the dreams of avarice. Cholesterol has a constitution probably represented by this formula—

The many interesting substances contained in ergot have been investigated by Messrs. Barger, Carr, Dale and several other chemists.

Medical Research

The Report of the Medical Research Council for the year 1925—6 has been issued this week: a hasty perusal of it shows that it is a document well worthy of the attention of those who are interested in the progress of chemistry. In the middle ages chemistry and medicine were closely allied; it appears to us that some of the most important developments of chemistry during the next 20 years will be in the regions of biochemistry and pharmacy, and that medicine and chemistry will again become, so far as they are sciences and not arts, bound together by numerous ties. The Report covers an extensive field, and we can merely allude to a small number of topics from it. There is a brief account of histamine, otherwise B-iminazolyethylamine isolated from ergot by Dale, Barger and Laidlaw before the war; this substance has an extraordinary power of causing contraction of muscle, and as it occurs in notable quantity in several parts of the animal body its importance in the regulation of various functions is becoming apparent. Further research work on cholesterol and the other sterols is described, also the recent work on

insulin. Insulin is not merely useful in the treatment of diabetes, it is of great use in physiological research, and especially in the examination of the chemistry of muscular contraction. What an extraordinary phrase this is: the chemistry of muscular contraction. It is perhaps the most singular evidence of the progress of chemistry that we have come across, and yet it is already a perfectly familiar one. A note on the relation of diet to the formation of teeth and the prevention of their decay deals with one of the vitamin questions. There is a notice of the work of Dudley, Rosenheim and Starling on spermine; the synthesis of this substance has been accomplished, and its constitution is therefore known. As it occurs in almost all living cells and has an effect on the nerves, it seems as if it plays an important part in the animal apparatus. Prof. Drummond, working in conjunction with Prof. Heilbron and Mr. Channon, has studied fish liver oils and, in particular, squalene; Heilbron has pointed out that squalene is a precursor of cholesterol, and it seems that hydrocarbons, somewhat similar to squalene, are more common in animal organs than was hitherto supposed. The Medical Research Council desires to extend work in chemotherapy, a word now used to mean the discovery or production of chemical substances which will kill infective organisms without killing the body itself: this study involves close touch between chemical and biological workers: details are given of the work carried on by Prof. C. H. Browning, of Glasgow, and Prof. J. B. Cohen, of Leeds, on the action of various amino-styryl quinoline compounds and on new organic compounds of bismuth. The biochemistry of nitrogen-fixing bacteria is being studied by Miss M. D. Whetham at Cambridge and Prof. McLeod at Leeds. The examination of anaesthetics is engaging the attention of Prof. F. G. Dounan and Mr. A. N. C. Bennett at University College, London. A special committee has investigated the legibility of type, and there is an immense variety of other research alluded to in the Report. We are glad to find that papers published in this JOURNAL are referred to: we hope that in the future we may be able to devote a little, a very little, more space to the great developments of biochemistry than has hitherto been possible. We have not been able in the past to deal often with drugs either from the point of view of the manufacturer or the user. If the modern tendency of chemistry towards life and disease is not a mere temporary phase, we ought to pay rather more attention to the manufacture of drugs as part of the chemical industry than we have done. The time is rapidly approaching when some knowledge of drugs is necessary to every all-round chemist, and when some knowledge of chemistry is essential to every well-educated person. We shudder to think how many subjects the well-informed chemist will have to learn, but are comforted by the reflection that when a study becomes too vast, provided you have the principles firmly in your mind, it is nearly as useful to know where to find the facts as to load your brain with them. Every chemist ought to know his way about Mellor, even if he has never read many of the volumes.

The Pageant of Chemistry

The British Industries Fair has opened its doors, and the pageant of British chemistry is displayed for all

the world to see. Buyers from thirty-four countries will visit the Fair; hundreds of keen, critical men from the provinces will be seen in earnest conversation at the stands, and in the evenings the public will be admitted to admire the resource and variety of British manufactures. We have visited the Fair before, and visited it often, but, let it be said at once, the Association of British Chemical Manufacturers have arranged the Chemical Section so conveniently at the Shepherd's Bush entrance, and the members of the Association have provided such tempting exhibits, so excellently arranged, that we have not been able to pass further into the Fair—the Chemical Section has provided enough and to spare. As it was last year, so it is this, but, somehow, this year's Chemical Section seems to be brighter, even more alluring. Is it the charm of the tavern, "At the sign of the Benzene Ring," which again houses the products of the South Metropolitan Gas Company, or is it that the revolving circular exhibit of the Gas Light & Coke Company, with its sectors brilliant with Prussian blue or pale with anthracene, suggests gaily the presence of a croupier ready with bags, not of money, but of sulphate of ammonia. What it is we do not know, but no one can deny that the dominating feature of the Section is the edifice—one can hardly call it a stand—erected by Imperial Chemical Industries, Ltd., which thus makes its first public appearance. The edifice, with its original and attractive design, symbolises admirably the world-wide scope of the new merger. The vast range of the company is effectively illustrated by a wonderful flow sheet, which shows, by means of an ingenious arrangement of coloured wires and arrows, how the various manufactures of the constituent firms are linked up, starting with primary raw materials such as air, sulphur, coal, brine and limestone, and passing through many intermediate products to manufactures such as dyes, fertilisers, bleaching powder, alkalis, ammonia, explosives. So can everyone see how closely the work of the chemist enters into the daily needs and doings of each and every one of us. Another aspect of the work of the chemist is portrayed by the British Drug Houses, Ltd. It only seems a few weeks since Dr. Harington described his synthesis of thyroxine before the Biochemical Society, but at the Fair, so quickly does the fine chemical manufacturer work, the British Drug Houses are showing examples of their synthetic thyroxine side by side with the glandular product, both available in quantity. Other B.D.H. novelties are irradiated ergosterol, containing vitamin D, and "Radiomalt," a food preparation which contains vitamins A and D, and saves childhood from the terrors of cod-liver oil. Space is running short, but we must mention the solvents and plasticisers for cellulose lacquers of Boake Roberts, the medicinal organic chemicals of May & Baker, the rare earth chemicals of Hopkins & Williams, Howard's new solvent, Sextol, Whiffen's vermilion, Bush's essential oils and solvents, Allen's oxalates, Tyrer's nickel formate and new reagent bottles, the interesting exhibit of Albright & Wilson, whose "silicon ester," so valuable for the preservation of stone, is now used as a medium for painting—decorative and artistic—with striking possibilities. We must resign ourselves to be incomplete, for the riches of the Chemical Section are far too great for our limited space.

THE SCIENCE OF THE SOIL

By H. J. PAGE, M.B.E., B.Sc., A.I.C.

As the medium on which man is ultimately dependent for the whole of his food supply (excepting only sea food), the soil is a material the study of which is of the greatest interest and importance. The complex and varied nature of its composition, and of the processes that occur in it, makes that study an intricate affair.

The soil consists of a mineral framework of rock material with which is associated colloidal matter of inorganic origin, derived from the weathering of this rock material, and of organic origin, derived from the breakdown of the residues of plants and animals.

Permeating this system are an aqueous phase existing partly as a free water film and partly in association with the colloidal matter in the gel condition, and a gaseous phase, the soil atmosphere. The whole is the habitat of a soil population, embracing organisms of the greatest variety—bacteria, actinomycetes, fungi, algae, protozoa, earth-worms, not to mention insects and other animals which are in the soil rather than of it. There is, in addition, a large number of relatively simple substances, both inorganic and organic, some in solid form, and some in solution—the products of chemical changes undergone by the more complex constituents, as a result either of the metabolic processes of the soil organisms, or of reactions of a non-vital origin.

Until recent years only the chemistry of the soil had received much attention, and that without providing any close insight into the nature of the chemical processes that occur in it or of the constitution of its chief components. The position of the subject has only recently passed beyond the stage that may be described as "matriculation chemistry applied to the soil." It is not difficult to see why this should be so. The parent substances of the most important soil constituents are themselves compounds of very great complexity, the constitution of which is not known. The complex silicates of rocks present some of the most difficult problems of inorganic chemistry, whilst the chief ingredients of plant residues—cellulose, lignin, hemicelluloses, pentosans, and the like—still provide a rich field of investigation for the organic chemist. When the constitutions of the parent substances are so complex and uncertain, it is not surprising that the chemistry of the products to which they give rise in the soil, the clay and humic substances, is still so little understood, more especially since these substances are colloids. The subject of colloid chemistry, despite the big advances that have been made in recent years, is still in its infancy, and although it affords much valuable information regarding the methods of handling soil colloids, it is not of much assistance in the study of their chemical nature. Many of the chemical changes which occur in the soil are of biological origin. The biochemistry of any one of the many kinds of micro-organisms in the soil is, however, to a large extent unknown, even in pure culture, and still less is known of the reactions occurring in the presence of such a heterogeneous mixture of all sorts and conditions of micro-organisms as exists in the soil.

The literature of such a many-sided subject is naturally a very comprehensive one, consisting for the most

part of original papers published in scientific and technical journals. The subject is of such recent growth, and knowledge is advancing so rapidly, that one can scarcely expect to find an authoritative and up-to-date review of it in all its aspects from the pen of a single author. One must look rather to the writings of specialists in the different branches of the subject, either in the form of monographs by single authors, or in the form of collections of papers or symposia on special questions. A convenient opportunity of contrasting these different methods of dealing with the subject, and at the same time of reviewing some of the most important of its aspects, is afforded by the recently-published works noted below.*

The first two volumes are examples of monographs by specialists. The book by Professor Stoklasa deals with methods for the biochemical investigation of the soil, a subject to which he has long devoted a large part of his energies. A defect from which any monograph of this type is liable to suffer is that of showing an undue bias to the views and methods favoured by the author. Stoklasa's monograph is certainly not free from this defect, and many sections of the book must be read as a presentation of the author's own point of view rather than as a critical review of rival hypotheses. The result is a very marked unevenness of treatment of the subject. A quite disproportionate amount of space is devoted to the so-called "rhizosphere bacteria," and to the author's work on such subjects as root respiration, radioactivity of soils, and the determination of the "availability" of phosphates and potash in the soil.

The introductory part of Stoklasa's monograph is devoted to an exposition of his own views regarding the existence and functions of specific "rhizosphere bacteria," which are supposed to be symbiotically associated with the roots of growing plants. One fact on which stress is laid is that of the considerable differences that exist in the "feeding power" of plants for insoluble substances such as mineral phosphates. In this connexion the author does not support Prianishnikov's views on the action of "physiologically acid" fertilisers such as ammonium sulphate, but ascribes greater importance to the nutritive action of fertilisers and of carbonaceous material on the bacteria, which are thereby enabled to produce greater amounts of carbon dioxide and organic acids, to the production of which the availability of insoluble phosphates and the like is due. There can be little doubt that this view has much to support it, but in the writer's opinion it has no bearing on the reality of the existence of a specific "rhizosphere" microflora; most of the free-living

(4) "The Science of Soils and Manures." By J. Alan Murray, B.Sc. Third edition, revised and enlarged. Pp. xiv + 298. London: Constable & Co. Ltd., 1925. Price: 12s. 6d. net.

micro-organisms of the soil could take part in such processes. The author rightly lays stress on the selectiveness of the plant in its absorption of plant nutrients from the soil. The importance of recognising this has recently been aptly pointed out by Hoagland thus: "Water may be absorbed either more or less rapidly than the ions present in the solution, depending on the conditions of growth and transpiration, the concentration of the solution, and the nature of the ion. It is equally incorrect to consider the plant either as an organism carefully selecting only the essential ions from the culture medium, or as a sort of wick, taking up the solution, evaporating the water, and leaving the solutes behind."

In common with most other workers on the subject, Stoklasa assumes that the nutrient substances absorbed by the plant root are absorbed in solution. The alternative hypothesis advanced by Comber, largely lacking though it is in experimental support, might, however, have been referred to.

The first main section of the monograph deals with the methods of biochemical and biophysical investigation of the soil. Most of the matter discussed in this section is, however, of purely chemical and physical nature, the inclusion of which in a biochemical treatise is somewhat unnecessary, and the value of which is in any case much reduced by the incompleteness and often the out-of-date nature of the subject matter. Thus we find the old selective absorption theory of soil acidity still retained, with no mention of more modern views; the rather surprising statement is made that the "state of saturation" of clay acids has little effect on the reaction, although the work of the last few years has abundantly shown the opposite to be true. Stoklasa takes to himself the main credit for the use of weak citric acid in the estimation of the probably available phosphates and potash of the soil, the well-known and widely-used method of Dyer being only incidentally mentioned. Of the many methods proposed for isolating the "soil solution" only the pressure method of Ramann is described, although the most widely used method in recent years is the displacement method of Ischerekov-Parker.

The next main section of the book, written with the co-operation of V. Kás, deals with the study of the soil organisms and their actions. Here, again, a marked personal bias is evident in many places, and much non-Continental work is not mentioned. Thus under the heading of nitrification no reference is made to the classical work of Warington. Wann's claim that the soil algae are able to fix atmospheric nitrogen is accepted, although that claim has been shown by Bristol and Page to be without foundation. In dealing with the sulphur cycle the extensive recent work of the New Jersey school on sulphur-oxidising bacteria is not mentioned. However, a considerable amount of useful information has been collected in this section.

The third section of the book is concerned with the organic matter of the soil. The subject as a whole is treated in a rather incomplete fashion, the larger part of the section being given up to the work of the author and his co-workers on the carbon-dioxide production of the soil as a measure of biological activity.

An uninformed reader of Stoklasa's book would derive from it the impression that the most of our knowledge of the biology and biochemistry of the soil was due to the labours of Continental workers, and that the United States was the only English-speaking country that has contributed even modestly to the subject. He would conclude that English workers had achieved practically nothing, and that Stoklasa and his school had brought about the most considerable additions to our knowledge. Without in any way wishing to detract from the acknowledged great importance of Stoklasa's work and from the high position he holds in the subject, it must be pointed out that the book under notice gives an incomplete treatment of the subject, which is often sadly lacking in a sense of proportion. It can be commended to the expert who requires information on specific Continental investigations and, in particular, on the views and work of the Prague school, but as a general and comprehensive account of the subject it cannot be recommended.

The first part of the second volume under notice is a brief and self-contained article by Prof. Mitscherlich, in which he describes those methods of physical examination which are specially designed to provide information regarding the pore space and internal surface of the soil. This is a subject to which Mitscherlich has given much attention, and on which he is qualified to write authoritatively. Some space is also devoted to the water relationships of the soil, though here the treatment is less complete, probably intentionally; permeability and evaporation are only briefly discussed, and no experimental detail is given.

Following this, and occupying more than half of the whole volume, is a monograph by Prof. Hager on the soil colloids. In the introduction the author lays emphasis on the essential similarity between sols and gels with regard to the innate nature of many of their properties; as pointed out by Wiegner, it is important to remember this, since most of the colloidal matter of the soil exists normally in the gel condition, whilst a large part of our knowledge of the properties of colloids is derived from the investigation of sols.

On the whole the subject is dealt with by Hager in a markedly rational manner, although the treatment suffers, especially in that part specifically devoted to methods, from an entire absence of reference to work described in non-German journals. The author admits this shortcoming, which is excused by the inaccessibility of foreign journals in Germany since the war. It must be acknowledged that this excuse has some justification, although it is to be hoped that the position is now improving; but, however legitimate it may be as an excuse, it does not get away from the fact that much important modern work which is decidedly germane to the subject matter discussed is ignored; to this extent the monograph fails to give a complete account of modern views and methods. Thus the views of Stremme and of Wiegner on the origin of "zeolitic" soil colloids by mutual precipitation of sols of alumina and silica have been somewhat discounted by later work. Similarly, doubt has now been thrown on the older view quoted by the author according to which only a very small amount of the clay in the soil consists of "colloidal clay." However, despite its omissions, the monograph provides

a lucid and tolerably up-to-date account of present-day views. In the section on adsorption stress is laid on the essentially empirical nature of Freundlich's isotherm, and some of the pitfalls attending its use are demonstrated. It is rightly pointed out that chemical forces may play a large part in "adsorption" phenomena. The influence of the "state of saturation" with exchangeable bases, and of the kind of base, on colloidalilty is recognised.

The concluding part of this volume is an account by Prof. Grafe of methods for the detection and estimation of the organic and inorganic constituents of plants. It is not obvious why this article is included in this section of the "Arbeitsmethoden," which professes to be confined to the study of the soil.

The perusal of these two volumes of Abderhalden's monumental work reveals one of the faults which it is difficult to avoid in such co-operative productions. There is an appreciable amount of unnecessary overlapping and repetition. Thus, Mitscherlich's method for the determination of moisture and hygroscopicity of soils is described, with identical illustrations, three times in the two volumes, by Stoklasa, by Mitscherlich, and by Hager, whilst two of the three describe Wiegner's apparatus for mechanical analysis. An annoying feature is the absence of indexes to the separate volumes; this omission one associates more with Gallic than with Teutonic publications.

The Faraday Society's General Discussion on Base Exchange in Soils, which forms the subject of the next volume under notice, is an example of a much more specialised work, in which the views and results of a number of investigators in this field are set forth and discussed. Although the chief facts of base exchange in soils, as a phenomenon accompanying the adsorptive action of soils on salts, were discovered over seventy years ago by J. T. Way, it is only in the last decade that the subject has come to be recognised as one of considerable importance in the study of the soil. Indeed, the subject has now become such a popular one with soil investigators that there appears to be some danger of its becoming a "craze" in the same way that p_H has been almost run to death in recent years.

One of the most active and successful investigators of the subject is Dr. Hissink, the well-known Dutch soil scientist, and the Faraday Society was most fortunate in securing his attendance at the discussion, to which he contributed the opening paper. In this paper he gives a succinct and lucid explanation of his work, which serves admirably to show the main outlines of the subject. The succeeding papers by Prof. Comber, Messrs. Page & Williams, Robinson & Rice Williams, Saint, and Fisher, and the discussion which followed, not only show what British soil workers are doing in this field, but they also develop in more detail most of the important applications of base exchange to related soil phenomena such as the effects of manuring, the problem of soil acidity, and the colloidalilty of the soil. Although, hitherto, since the work of Way, the most important contributions to the study of base exchange in soils have come from abroad: from Hissink in Holland, Gedroiz in Russia, and Kelley in California, the action of the Faraday Society in holding this discussion and in publishing this volume must be reckoned as an important

contribution from this country which has undoubtedly done much to stimulate further work on the subject both here and abroad.

The last volume under notice is an example of an entirely different type of work. In contrast to the monographs in Abderhalden's *Arbeitsmethoden* and the Faraday Society's symposium on a highly specialised subject, Mr. Murray's book sets out to treat of the whole science of soils and manures in one volume of 300 pages. As pointed out in the earlier part of this article, one can hardly expect to find an authoritative account of such a rapidly advancing and complex subject from the pen of a single author. Murray's book, which is a new edition of a volume published in 1910 under the title of "Soils and Manures," cannot be said to disprove that statement. It is true that considerable alterations have been made in comparison with the earlier book, and that a valiant attempt has been made to cover the whole subject adequately, but the space is so restricted and the task so large that some aspects of the subject were bound to be neglected. The book is primarily intended as a manual for students for University Degrees and College Diplomas, as well as for planters and cultivators both in this country and overseas. For this type of reader a certain simplification of points of view is desirable, and many of the more advanced and intricate modern developments are best omitted or only lightly sketched in. For this reason some of the inaccuracies and omissions of the book need not be the subject of serious cavil. The advanced soil investigator would question the accuracy of statements such as that kaolin is the chief constituent of clay in soils, that hygroscopicity is a purely mechanical property, that when a soil comes in contact with a salt solution the resulting solution is generally more dilute, or that superphosphate is an acid manure. Similarly, he would deplore the fact that much of the more recent work on soil colloids, and the relation of their exchange reactions with cations to such important soil properties as tilth and acidity is scarcely mentioned. Some other respects in which the book is not as up-to-date as its preface would lead one to expect are the very scanty treatment of the carbon cycle in soil; the treatment of soil fertility in the chapter bearing that title, in the old-fashioned way as an almost wholly chemical phenomenon; the absence of any reference to the use of cresylic acid for partial sterilisation of soils in glass-houses; the omission of lucerne as a crop which has given important practical results from inoculation with nodule bacteria; and the omission of any reference to the Haber process for the fixation of atmospheric nitrogen, and to the successful working of an adaptation of that process for the large scale production of sulphate of ammonia at Billingham. Of perhaps greater importance for the general reader and the less advanced student is the presence of some definite inaccuracies; thus it is stated that ionisation is the *essential* difference between true solutions and colloid solutions; that soils are ignited prior to mechanical analysis; that nitrification is the term applied to include *all* the changes which nitrogenous constituents undergo in the decay of organic matter in the soil.

The picking of holes is the reviewer's prerogative, and he is often liable to take the line of least resistance and

to avail himself of it, and so to give perhaps an unduly unfavourable impression of the volume under notice. Let me therefore hasten to remark that much of Mr. Murray's book is excellent, and that his method of exposition is usually lucid in the extreme. There is in the book far more matter with which no serious fault can be found than there is of subject for stricture. Mr. Murray's book is primarily for the use of the student, whose reading is usually supplemented by personal instruction from his teacher. The specialist soil investigator, on the other hand, will not find it of much assistance. He is more dependent on books of the type of the other volumes here noticed, and even these must be read with discrimination. Only the specialist in any one branch of a subject can write an adequate account of that side of the subject, and unfortunately he is often so specialised that he loses his perspective of the rest of the subject.

Progress in so pre-eminently a "borderline" subject as the study of the soil must necessarily lag behind that in the pure sciences on which it depends, and only by the co-operation of specialists in those pure sciences can any real advances be made. However, such co-operation has obtained in increasing degree in recent years, and such formerly neglected aspects of the subject as the physics and biology of the soil have now received so much attention that we can truly speak of soil science as a distinct and increasingly important branch of applied science.

BRITISH INDUSTRIES FAIR

The Exhibition at Birmingham

The British Industries Fair, Birmingham, 1927, which is an integral part of the Board of Trade British Industries Fair, was opened at Castle Bromwich, Birmingham, on February 18, and will remain open until March 4. As last year, the undertaking is receiving whole-hearted recognition and active co-operation from the Birmingham Corporation, and the Lord Mayor of that city (Alderman A. H. James) attended at the formal opening, at which there was a most representative attendance of business and commercial men from the Midlands and many parts of the country.

The Birmingham Fair, which represents the heavy industries of this country, is by far the largest industrial exhibition ever held in the provinces, and the largest to be held under one roof in the country. The area exceeds 6 acres—the enclosed space is 250,000 sq. ft., and 130,000 sq. ft. represents the space taken by stands, of which there are 600, compared with 400 twelve months ago. The three exhibition halls have been enlarged considerably, 73 ft. being added to the width of each, so that the Fair is exactly 33% bigger than that of 1926. The schedule is the same as last year. The heavy industries have been divided into 10 groups. The biggest section in point of numbers is that devoted to hardware and brassfoundry, the number of stands being 167. Next in importance is the engineering group with 134 stands, together with 35 firms who are responsible for a co-operative exhibit, namely, a modern boiler house of great size. This is a new and spectacular contribution to the Fair, and

the object of it is, of course, to enable industrialists to visualise a thoroughly modern boiler house on practical lines, with each component part in its correct position. Powdered fuel firing and oil firing methods may be seen, and the generation of electricity on economical lines and the application of it find a place in the scheme. The engineering group is of special interest; it is more representative than last year, and important Sheffield firms are prominent among the exhibitors. Out of 114 stands in the power, lighting and heating group, 85 belong to the electrical industry. The non-ferrous metal trades are admirably represented; stainless steel for a variety of purposes is much in evidence; the drop forgers have a huge exhibit showing the increasingly important parts which drop forgings play in general and special engineering work; and electro-plating plants are also of special interest. The research laboratory of the Birmingham Gas Department has a large stand showing scientific equipment and gas-heated furnaces, and metallurgical problems and tests are dealt with on the spot.

Although the chemical industry is represented at the London Fair, there is at Birmingham a very fine display of paints, varnishes and lacquers, and on Stand 85, Building "A," visitors will see the applications of cellulose finishes used for metal and wood surfaces on such diverse objects as filing cabinets and railway coaches. On this stand may be seen a range of patterns beautifully finished in Belco, a cellulose finish manufactured by Nobel Chemical Finishes, Ltd., an associated company of Nobel Industries, Ltd. It is interesting to note that these finishes are actually being used by one of the biggest metal filing cabinet manufacturers in the country, and that Belco has also been applied to several coaches on two of the great English railways. The coaches are in use as a test of durability of this type of finish, and from recent reports to hand it is giving every satisfaction. Other exhibits of interest are pedestal and counter weighing machines, bronze taps and meat covers, and many other similar articles showing the application of Necol glossy enamels, another product of Nobel Chemical Finishes, Ltd. Furniture trade visitors' attention is called to Belco wood finish for furniture, which has many advantages over the ordinary french polish, and will withstand heat and the damaging effect of weak acids and alcohol.

Throughout the Fair the British tradition for a high quality standard is well maintained, and full credit is due to the British manufacturer for his determination to cater adequately, and at competitive prices, for the home and foreign markets. There is evidence of a desire to get at close grips with foreign competition.

STORY OF BAKELITE

A cinematograph film, entitled "The story of bakelite," will be exhibited at the Tyseley picture house, Greet, Birmingham, on March 3, at 3 p.m. The exhibition has been arranged by the Damard Lacquer Co., Ltd., in association with Mouldensite, Ltd., Redmanol, Ltd., and the Bakelite Corporation of Great Britain, Ltd.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

ANNUAL GENERAL MEETING, 1927 ACCOMMODATION IN EDINBURGH

Members who intend to be present at the Annual Meeting in Edinburgh will please note that the private bathroom accommodation, and all the single bedroom accommodation, in the North British Station Hotel have now been booked up for the week of the Meeting.

Some double bedrooms, with one or two beds, are, however, still available.

For list of Hotels and University Hostels, with respective tariffs, see CHEMISTRY AND INDUSTRY for February 4, p. 105.

LIST OF MEMBERS ELECTED

February 11, 1927

- Briggs, James A., 5, Cowgate, Dundee. Tar Distiller.
- Burghart, Lloyd M., Research Laboratory, U.S. Industrial Alcohol Co., Box 1103, Baltimore, Md., U.S.A. Director of Research.
- Burns, James A., Brewer's Room, Anchor Brewery, Mile End, London, E.1. Chemist.
- de Goenez, Dr. Denis, Arnold Printworks, North Adams, Mass., U.S.A. Chief Chemist.
- Duvosin, Alexander H., 4, Kensington Gate, Glasgow, W.2.
- Exell, Harold C., 41, Cantley Avenue, Clapham Common, London, S.W.4. Research Chemist.
- Garrels, John C., c/o Mathieson Alkali Works, Inc., Saltville, Va., U.S.A. Assistant Manager.
- Gellman, Israel, "Resthaven," 205, Brondesbury Park, Willesden Green, London, N.W.2. Research Chemist.
- Grattan, George E., Seed Branch, Department of Agriculture, Ottawa, Canada. Chemist.
- Hatfield, Dr. H. Stafford, Thackeray House, Maple Street, London, W. Consulting Engineer.
- Herstein, Dr. Bernard, U.S. Industrial Alcohol Co., 110, East 42nd Street, New York, N.Y., U.S.A. Chemist.
- Hunt, Arthur J., The Technical College, Cardiff. Bakery Lecturer.
- Hutchison, William Bell, 15, Radnor Street, Clydebank, N.B. Analytical Chemist.
- Jack, John A., 185, Neilston Road, Paisley, N.B. Chemist.
- Jackson, Joseph T., Wesleyan College, Bankura, B.N.R., India. Professor of Chemistry.
- Johnson, Alfred E., "Mayfield," 56, Stamford Brook Road, London, W.6. Chemical Sales Manager.
- Karwan, John, 18, Suburban Road, Anfield, Liverpool. Chemist.
- Le Moignan, Clarence S., Messrs. C. Le Masurier, Ltd., 86, Bath Street, Jersey, C.I. Technical Director and Secretary.
- McConnell, John A., 12, Haywood Avenue, Ormeau Road, Belfast, N. Ireland. Assistant Chemist to Corporation Gas Works.
- McCrone, Robert O. Orr, 50, Westbourne Gardens, Glasgow, W.2. Research Chemist.
- Mann, Charles E. T., The Globe, Long Ashton, Bristol. Research Chemist.
- Megson, Norman J. L., "Brunswick House," Olton, near Birmingham. Chemist.
- Merrick, John J., 14, Park Road, Sparkhill, Birmingham. Research Chemist.
- Mills, Miss Ethel, 35A, High Street, Rugby. Assistant Chemist.
- Nash, Alan W., The Leathersellers' Company's Technical College, 176, Tower Bridge Road, Bermondsey, London, S.E.1. Registrar.
- Pearson, Bertram Malcolm, 83, Ruskin Drive, Denton's Green, St. Helens, Lancs. Chemist.
- Phillips, Dr. Henry, Battersea Polytechnic, London, S.W.11. Research Chemist.
- Powell, D. H. Gordon, c/o P. & O. Banking Co., Cockspur Street, London, S.W. 1. Oil Engineer.
- Price, W. Geoffrey, Hawthorn Grove, Wilmslow, Manchester. Traveller.
- Richmond, John H., Cherry Bank, Morris Lane, Kirkstall, Leeds. Chemical Engineer.
- Saxon, Robert, Westfield Terrace, Baildon, Yorks. Schoolmaster.
- Simpson, Miss Winifred M., "Rostrevor," Southwold, Suffolk. Teacher of Science.
- Swan, Richard L., Messrs. A. & F. Pears, Ltd., The Soap Works, Isleworth, Middx. Works Chemist.
- Tritton, Frederic J., 45, Ranelagh Road, Ealing, London, W.5. Chemist and Technical Manager.
- Weber, Harry M., 88, Broad Street, Boston, Mass., U.S.A. Research Chemist.
- Wiegand, William B., Messrs. Binney & Smith Co., 41, East 42nd Street, New York, N.Y., U.S.A. Chemist.
- Wilkinson, J., Nottingham Corporation Gas Department, 6, George Street, Nottingham. Engineer and General Manager.
- Wylam, Dr. Birkett, 54, South Marshall Street, Grangemouth, Stirlingshire. Chemist.

BIRMINGHAM AND MIDLAND SECTION

At a meeting at the University of Birmingham, on February 8, Mr. J. C. Munn presiding, Mr. F. Twyman, F.R.S., lectured on "Metallurgical spectroscopic analysis."

The author, dealing first with the historical aspects of the spectrum analysis by emission spectra, pointed out that Newton's discovery of the dispersion of light, published in 1672, was the first step to the development of spectrum analysis. The publication by Kirchhoff and Bunsen, in 1861, of their discovery that the vapour of a metal produces absorption lines identical in position with the emission lines of its flame spectrum, and their accompanying description of their spectrometer, and of the first use in that spectrometer of a collimator, brought spectrum analysis up to a point beyond which it was not to develop to any considerable extent for many years. The method won many brilliant successes, among them the discovery of numerous new elements. Yet it was to be nearly 50 years before it even began to fulfil the original expectation that it would find use as a general method of qualitative analysis.

Now those chemists (they are very few) who use the spectroscope, use it very often and find it indispensable. As a means of detecting minute quantities of the metals it is unrivalled. A metal can be readily distinguished in the presence of any other element, compound or mixture without the necessity of separation. The qualitative analysis of the metallic constituents of a substance, which the spectroscope gives so easily, is a sure basis for planning a chemical analysis. As the determination of each element proceeds the purity of precipitates may be checked as often as desired.

Of recent years, therefore, attempts have been made in the laboratory of Adam Hilger, Ltd., and elsewhere, to found a method of quantitative analysis on observation of the varying intensities of the spectrum lines with the proportion of the corresponding ingredients. It is true attempts of the kind were made many years ago, and were not very successful. Recent attempts, however, have been more so.

The lecturer then described spectrographic methods for the quantitative determination of impurities present in a metal which have been found to give reliable results. Work carried out in the Hilger laboratories had shown that, in general, one could distinguish between 0.001%, 0.01%, 0.1% and 1.0% of any metallic impurity, and in many cases intermediate stages, by visual examination of the comparative intensities of the lines. Examples were given relating to the estimation of bismuth in copper, calcium in magnesium, aluminium in brass, nickel and chromium in steels.

GLASGOW SECTION

A symposium on "Rubber" was held by the local section and the Institution of the Rubber Industry in the Institute of Engineers and Shipbuilders, Glasgow, on February 15, Mr. S. H. B. Langlands presiding.

The first paper, on "The effect of heat on raw rubber in the presence and absence of air," by G. D. Fry, M.Sc., and B. D. Porritt, M.Sc., F.I.C., was read by Mr. Porritt.

A brief history of the progress made in the utilisation of raw rubber was given, and attention was drawn to the importance of the "milling" process and to the changes which took place as a result of that treatment. The results of an investigation of the effect of heat upon raw rubber were given, along with a detailed description of the experimental work. The heating of raw rubber in the presence of air brings about a definite lowering of the value of the solution viscosity, to an extent depending on the temperature to which the rubber is raised and on the duration of heating. In order to test whether this change is due to heat alone, raw rubber was heated in presence and in absence of oxygen. When heated in a vacuum, or in an atmosphere of steam, hydrogen, or nitrogen to a temperature of 150° C., no great change in solution viscosity can be detected.

On the other hand, when heated in presence of oxygen the solution viscosity of raw rubber shows a marked decrease, and under the particular experimental conditions a relation was established between the quantity of oxygen present per gramme of rubber and the fluidity of the resulting solution.

It would thus appear that the marked changes in solution viscosity which are produced by heating in air are due to some chemical action between the rubber and the oxygen present, and that the effect produced by "milling"—so far as is indicated by solution viscosity—can be imitated by heating rubber in the presence of air. The results which had been obtained had special reference to the changes which occur during washing, drying (both in air and in vacuo), in the milling of raw rubber, and in connexion with the storage of unvulcanised compounded stock.

The second paper, on "The hardness testing of

vulcanised rubber," was read by Mr. T. R. Dawson, M.Sc., F.I.C.

Four types of indentation tests on rubber were described: the helical-spring durometer type, the dead load plastometer, the impact test scleroscope, and the Herbert pendulum. The first two tests were described as "static," while the last two were called "dynamic resilience" tests. The kind of result obtained in these tests was outlined in connexion with the effects of temperature of testing, the time of "cure" of a range of rubbers, and the proportions of the compounding ingredients. Correlations between the different instruments were examined, and, as in the corresponding cases of metal hardness testing, some notable linear relations were found in particular groups of samples, whilst in other groups the relations were exceptional. It was concluded that the factors which govern the static hardness properties must also operate largely in the dynamic resilience properties.

The third contribution to the symposium was "A demonstration of a new piezo-micrometer," by Mr. James Strachan, A.I.C.

The inventor described this new instrument and showed how adaptations had been made upon those instruments to which reference had been made in the second paper. Attention was directed to the simplicity of the instrument without loss of sensitivity, and to the numerous uses to which it might be put in various industries.

LIVERPOOL SECTION

A meeting was held on February 18, in the Muspratt Lecture Theatre, the University. Professor E. C. C. Baly was in the chair in the absence, through illness, of the chairman of the section.

Colonel Sir Frederic L. Nathan, K.B.E., delivered a lecture on "Fuels for internal-combustion engines."

Sir Frederic Nathan first pointed out that so long as petrol is available at present prices its use will continue. Opinions differ as to how long supplies will equal requirements, but search for new sources is extending, improved methods of winning are constantly being introduced, recovery of natural gas is augmenting supply, and the quantities of light spirit obtained by "cracking" are increasing; moreover, the enormous shale deposits are practically untouched. On the other hand, it may be that saturation point as regards motor vehicles is being reached more rapidly than the world's supplies of petrol are being exhausted.

Owing, however, to the dependence of the British Empire on imported petrol, the production of alternatives is a matter of importance. Benzol, of which limited quantities are obtained from gas works and coke ovens, is the most suitable. Naphthalene from gas works can be hydrogenated to produce liquid tetralin which can be used with benzol and alcohol as a motor fuel.

Much consideration has been given to alcohol production. Its large scale manufacture, by fermenting the sugar and starch of vegetable materials, is impossible in this country for many obvious reasons. In the Empire overseas, however, its manufacture in this way is possible and is taking place, using molasses, cassava, sweet

potatoes, etc., as raw materials. A fermentation process is also being worked out for producing alcohol from tropical grasses, straws and waste vegetable materials. This process might provide limited quantities of fuel in various parts of the Empire.

Other possible sources of alcohol in limited quantities are:—(a) Sawdust and wood treated by the Prodor process; (b) Ethylene recovered from coal and coke oven gases; (c) Acetaldehyde prepared from carbide; (d) The lyes from the sulphite paper-making process.

Alcohol alone cannot be used in existing engines to develop maximum efficiency. A mixture of alcohol, benzol and petrol is quite suitable, however, and limited quantities are prepared, under the name of Discol, by the Distillers Company.

Coal is the obvious raw material for the production of liquid fuels in this country. By distilling it at temperatures of about 600° C., some three gallons of motor fuel and other products are obtained per ton of coal. At present the process is being worked commercially only in certain cases where all conditions are favourable. The liquefaction of coal by the Bergius process has passed the experimental stage in Germany, and if it can be worked commercially the quantities of liquid fuel would be practically unlimited.

The Badische Company in Germany, and Patart in France, have made methyl alcohol commercially by passing hydrogen and carbon monoxide over catalysts. Fischer and Tropsch, the Badische Company and Patart have also succeeded in making from the same gases mixtures of liquids suitable for motor fuels. So far, however, none of the processes has reached the commercial scale, although there is little doubt that success will be achieved at no very distant date.

The combustion of anthracite, gas coke and charcoal in suction gas producers gives rise to gaseous fuels that can be used in existing motors, and coal gas can be similarly employed. Suction gas producers using charcoal prepared in portable charcoal burners in the forests are being fitted to motor lorries in France. There are one or two experimental types in this country designed to use anthracite, but low-temperature coke is also very suitable.

It is not possible to predict which, if any, of these sources will develop to provide alternative liquid fuels. It may well be that before the supplies of motor spirit from petroleum and shale are exhausted, some other form of propulsive power may have been discovered.

SOUTH WALES SECTION

A meeting was held jointly with the South Wales sections of the Institute of Chemistry and the Institute of Metals, at the University College, Swansea, on January 26, when a paper on "Quantitative spectrographic analysis in metallurgy" was read by Mr. J. R. Green, M.C., B.Sc., B.I.C. The chair was taken by Mr. A. M. O'Brien, F.I.C.

The lecturer commenced by demonstrating the copper and zinc lines in the visible spectrum of an arc between copper and brass poles, also the taking of comparison spectra on a large quartz spectrograph. He then, by means of lantern slides, explained how, when the proportion of a given metal present in another or in an

alloy is gradually increased from zero, the lines due to the metal in question appear in a definite order in the spectrum. When the proportion is large, most of the lines of the "foreign" metal will appear, and a considerable variation in the percentage of it will cause little alteration in spectra. Hence complete quantitative analysis of an alloy is not practicable by spectral means as a rule.

When, however, the content of the "foreign" metal (or metals) is small, say 1% or less, few of its lines appear, and by carefully comparing the spectra of similar alloys of known composition with that of an "unknown" taken on the same plate and under the same conditions in every respect, the percentage of "foreign" metal can be very closely determined.

An interesting discussion followed, in which Messrs. C. M. W. Grieb and L. Tavernier took part. After Mr. Green had replied, a cordial vote of thanks was accorded him for his paper.

CALENDAR OF FORTHCOMING EVENTS

- Feb. 26. NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS, Mining Institute, Neville Hall, Newcastle-upon-Tyne, at 3 p.m. "Winning thin seams of Great Britain," by W. Leebetter.
- Feb. 28. SOCIETY OF CHEMICAL INDUSTRY. *Joint meeting of the Yorkshire Section and the Fuel Section.* Queen's Hotel, Leeds, at 2.30 p.m. (See further particulars on p. 125 of the issue for Feb. 11, and p. 153 of the issue for Feb. 18.)
- Feb. 28. ROYAL SCOTTISH SOCIETY OF ARTS, 117, George Street, Edinburgh, at 8 p.m. "The application of coal and oil to marine propulsion," by A. S. Younger. (Also on March 14.)
- Mar. 1. HULL CHEMICAL AND ENGINEERING SOCIETY, Hull Photographic Society's Rooms, Grey Street, Park Street, Hull, at 7.45 p.m. "Stainless steel," by Dr. W. H. Hatfield.
- Mar. 1. INSTITUTE OF METALS, *North-East Coast Local Section.* Armstrong College, Newcastle-on-Tyne, at 7.30 p.m. Annual General Meeting.
- Mar. 1. INSTITUTE OF CHEMISTRY, 30, Russell Square, London, W.C.1, 49th Annual General Meeting, at 4.30 p.m. The Meldola Medal will be presented to Dr. R. G. W. Norrish.
- Mar. 2. UNIVERSITY OF LONDON, University College, Gower Street, W.C.1, at 5.30 p.m. "Volta," by W. H. Patterson.
- Mar. 2. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. (Ordinary Meeting). "The corrosion of metals at joints and crevices," by Ulick R. Evans.
- Mar. 2. SOCIETY OF PUBLIC ANALYSTS. Annual General Meeting. Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. (1) "Cacao butter substitutes and their detection," by A. W. Knapp, J. E. Moss and A. Melley. (2) "The detection of Illipé butter in chocolate," by H. W. Bywaters, F. T. Maggs and C. J. Pool. (3) "A study of the determination of saccharin, colorimetrically and by the ammonia process," by A. F. Lerrigo and A. L. Williams. Informal Dinner will be held at 6.30 p.m. at St. James's Restaurant, 178, Piccadilly, W.1.

- Mar. 3. SOCIETY OF CHEMICAL INDUSTRY, *Bristol Section*. The University, Woodland Road, Bristol, at 7.30 p.m. Annual Meeting. "Science and industry," by G. Gray.
- Mar. 3. INSTITUTION OF THE RUBBER INDUSTRY, *Birmingham and District Section*. The Grand Hotel, Birmingham, at 7 p.m. "The effect of carbon dioxide and antioxidants upon rubber," by Dr. S. S. Pickles.
- Mar. 3. INSTITUTE OF METALS, *Birmingham Local Section*. Meeting arranged by the Co-ordinating Committee, Engineers' Club, Waterloo Street, Birmingham, at 7 p.m. "Metal melting furnaces," by Dr. E. W. Smith.
- Mar. 3. INSTITUTION OF ELECTRICAL ENGINEERS. Ordinary Meeting. Savoy Place, Victoria Embankment, W.C.2, at 6 p.m. (1) "Illuminating engineering," by J. W. T. Walsh, and (2) "The problems of public lighting by electricity," by Lieut.-Commander H. T. Harrison. At 5.30 p.m. a demonstration of an electro-pneumatic lamp will be given by L. B. Atkinson.
- Mar. 3. CHEMICAL SOCIETY, Burlington House, Piccadilly, W.1, at 8 p.m. *Ordinary Scientific Meeting*. (1) "The decomposition of carbon monoxide in the corona due to alternating electric fields. Part II," by R. W. Lunt and R. Venkateswaran. (2) "The properties of the chlorides of sulphur. Part I. Freezing-points," by T. M. Lowry, L. P. McHatton and O. G. Jones.
- Mar. 4. SOCIETY OF CHEMICAL INDUSTRY. *Joint Meeting of the Manchester and Liverpool Sections*, to be held in Manchester. Visit to the Shirley Institute of the British Cotton Industry Research Association, Didsbury, Manchester. A paper will be read later on "Chemical control in the cotton bleaching industry," by D. Clibbens.
- Mar. 7. SOCIETY OF CHEMICAL INDUSTRY, *London Section*. Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. "Recent progress in the glass industry," by Prof. W. E. S. Turner.
- Mar. 7. GLASGOW UNIVERSITY ALCHEMISTS' CLUB. Annual General Business Meeting, at 7.30 p.m.
- Mar. 7. INSTITUTION OF THE RUBBER INDUSTRY, *London and District Section*. Engineers' Club, Coventry Street, W.1, at 8 p.m. "Some electrical properties of rubber," by P. Dunsheath.
- Mar. 7. INSTITUTE OF CHEMISTRY, *Manchester and District Section*. "Plant chemistry," by Prof. E. C. C. Baly.
- Mar. 8. INSTITUTION OF PETROLEUM TECHNOLOGISTS. Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m. "Two shallow oilfields in Texas," by Dr. A. Wade.
- Mar. 8. INSTITUTE OF BREWING, *London Section*. Engineers' Club, Coventry Street, Piccadilly, W.1. A paper will be given by H. Lloyd Hind.
- Mar. 9, 10 and 11. INSTITUTION OF CHEMICAL ENGINEERS. Conference and Fifth Annual Corporate Meeting and Annual Dinner. (For further particulars, see the issue for Feb. 18, p. 151).
- Mar. 9. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. (Ordinary Meeting.) "The utilisation of gas coke," by Dr. E. W. Smith.
- Mar. 9 and 10. INSTITUTE OF METALS. Annual General Meeting. (For full particulars see CHEM. & IND., 1927, p. 106.

CHEMICAL SOCIETY

On February 10, the President, Prof. H. Brereton Baker, C.B.E., F.R.S., occupying the chair, Prof. Ernst Cohen, of the University of Utrecht (Honorary Fellow of the Society), delivered the Kamerlingh Onnes Memorial Lecture at the Institution of Mechanical Engineers.

Prof. Cohen commenced by giving a sketch of Kamerlingh Onnes' early life—he was born at Groningen on September 21, 1853—and his school days. Onnes was a pupil at the Hoogere Burgerschool, Groningen; the Director being Van Bemmelen (afterwards Professor of Chemistry at Leyden), for whose influence he has expressed his gratitude in appreciative terms. Before he had attained his eighteenth year, Onnes had been awarded a gold medal by the University of Utrecht for an essay on vapour density; in 1871 he studied under Bunsen at Heidelberg, and later more exclusively in Kirchhoff's laboratory. While at Groningen he was actively interested in the Studentencorps, and, as Rector, actively opposed the suggested abolition of the University. In his doctorate thesis, presented at Groningen in 1879, Onnes remarked that the theorist must first be an experienced practitioner, and that experiments must always be guided by wide theoretical knowledge—an attitude which he maintained throughout his life. In October, 1882, the young assistant in Bosscha's laboratory was called to Leyden to succeed Ryke as Professor of Experimental Physics, and it was from this time that his work became a triumphal progress through the realm of low temperatures.

The first part of Onnes' programme consisted of an experimental test of Van der Waals' equation of state, investigations which led directly to the establishment of the famous cryogenic laboratory at Leyden. Onnes always expressed keen appreciation of the work of Dewar and others, and continually insisted on the fact that he owed much to their researches. No less did he acknowledge his indebtedness to the devoted care of his wife, Elisabeth Byleveld.

Having referred to the award of the Nobel prize in 1913, Prof. Cohen next proceeded to describe the successful liquefaction of helium in 1908. The circumstances attending this achievement included a premature report of success, due to solution phenomena of solid hydrogen in gaseous helium being mistaken for the solidification of the rare gas; Onnes' integrity both as a man and as an investigator is exemplified by the public announcement made immediately after he had discovered the mistake. He was surely entitled to be called the "gentleman du zéro absolu." He did not live to complete the last stage of his work on helium. After at least five unsuccessful attempts to obtain solid helium, he passed away on February 21, 1926, and it was left to Keesom to complete this work a few months later.

A constant demand for better instruments led Onnes, in 1901, to found the Society for the Promotion of the Training of Instrument Makers. The training school attached to the Leyden laboratory proved its value not only in the progress of investigations in that University, but also in many other institutions in Europe and America. The establishment in 1909 of the Association Internationale du Froid also owed much to his activities.

Kamerlingh Onnes' life, although long and rich in discoveries, had been all too short. It was, perhaps, his greatest triumph that, in spite of the honours and marks of esteem showered upon him by the whole world, he had remained a simple, genial, and kind-hearted man.

Prof. F. G. Donnan, C.B.E., F.R.S., proposing a vote of thanks, after adding his tribute to the memory of Prof. Onnes, said that Prof. Cohen was one of the most famous representatives of the famous thermodynamic school of Gibbs. Both the lecturer and the President, by their researches, had made life very difficult for the physicist. They were also alike in the importance which they ascribed to experiment, and in their desire to keep their theoretical views in the background. The motion was seconded by Prof. Sir James Walker, F.R.S., and, having been put by the President, was carried with acclamation.

A representative of the Netherlands Embassy was present, and expressed his appreciation of the recognition of Dutch science in general and the work of Kamerlingh Onnes in particular in this country.

At a meeting held on February 17, the President, Prof. H. Brereton Baker, C.B.E., F.R.S., reminded Fellows that the Anniversary Dinner would be held on March 24 at the Hotel Victoria, at 7 for 7.30 p.m. A ballot resulted in the election of 76 new Fellows.

Dr. H. O. Askew described :

The Production of Fog in the Neutralisation of Alkali with Hydrogen Halides.

Air carrying carbonyl chloride vapour after passage through charcoal and an alkaline absorbing medium sometimes gave rise to a fog over the solution, due to hydrolysis of the carbonyl chloride by adsorbed moisture, the hydrogen chloride thus produced being incompletely absorbed by the alkali. Phosphorus oxychloride behaved in a similar manner.

The absorption of hydrogen chloride in alkaline solutions was then studied. In aqueous solutions, whether simple or containing colloids, dyes, or suspended solids, in general the wider the jet the shallower the liquid, and the faster the gas was bubbled through the solutions the greater was the amount of fog formed.

The concentration of acid in the fog particles and the partial pressure of the water vapour in the gas remained practically constant and independent of the amount of fog formed. With alcoholic solutions the acid concentration in the droplets decreased with increase in concentration of alcohol. Pyridine solutions gave intense fogs. Hydrogen bromide was more active in fog formation than hydrogen chloride. In no case was any fog obtained after neutralisation of the alkali. The fog particles were larger when small amounts of fog were obtained than when large amounts were formed. No electrical charges have been found on the particles.

It is suggested that the alkaline film slows down very greatly the rate of absorption of the acid vapour, this being intensified by the added dyes etc. This film, however, very readily permits diffusion of water vapour into the bubbles of gas.

The President referred to other reactions in which fogs are observed, and to the possibility of condensation of moisture following ionisation being a cause of the phenomenon.

Prof. J. C. Philip said that the work arose out of an observation made during the war that, as soon as the carbonyl chloride in an air-carbonyl chloride mixture ceased to be completely absorbed by a charcoal, a fog appeared over an alkaline solution placed next in the gas stream. With present knowledge he was disinclined to theorise regarding the origin of the fog. The amount of hydrogen chloride in the fog droplets was strikingly constant, and the amounts escaping absorption were surprisingly large.

Prof. H. Bassett presumed that if hydrogen chloride were bubbled through sodium hydroxide solution of a concentration such that the vapour pressure was less than that of constant b.p. hydrochloric acid, no fog would result, and asked whether experiments had been performed in this direction. Apparently the surface film became saturated, excess of hydrogen chloride escaping. Prof. Philip interposed the remark that with sodium chloride solution all the hydrogen chloride was absorbed, but Prof. Bassett suggested that the "absorption compound" was not necessarily sodium chloride.

Dr. Askew replied that, although fogs were often formed when electrical charges were present, the experimental data were still somewhat conflicting. Hydrogen chloride solutions do not appear to follow exactly Ostwald's statement that no acid solution of concentration less than that of the constant b.p. mixture would fume in moist air. He agreed that the decreased absorption was probably due to a film round the bubble. Answering Mr. S. J. Gregg, the author said that surface tension did not appear to be a determining factor in the formation of the fog. In reply to a question concerning the possibility of the presence of ammonium salts, he said that the sodium hydroxide was always prepared from the metal.

Prof. D. R. Boyd discussed :—

The Mechanism of the Reaction between a Carboxylic Ester and a Grignard Reagent. [With H. H. Hatt.]

IN the preparation of tertiary alcohols from ethereal salts, if the ester is caused to react with the Grignard reagent in the presence of metallic magnesium, the products include a pinacone. It is now concluded that a ketone is formed as an intermediate step in the production of a tertiary alcohol from an ethereal salt. The process by which the ketone arises is also discussed.

The authors criticise the hypothesis of Stadnikoff :—

Lausitz district; indeed, the Germans claimed this to be the greatest concentration of glass works in the world. There were centres in Silesia, Dresden, Saxony, Thuringia, and Bavaria; whilst in the Saar district there was a considerable glass industry. Similarly, in the district between Cologne and Essen there was a strongly-developed industry, and a still further group of factories in the neighbourhood of Aix-la-Chapelle. Out of about 350 factories which existed in Germany in 1924, not more than between 50 and 60 were concerned with glass bottle production. The largest group of factories was that known as the hollow-ware group, which was identified with the production of all kinds of domestic articles. The manufacture of window glass and plate glass was also more widely separated than in Britain. Chemical and scientific glassware was also produced in considerable volume, the Thuringian factories being particularly important from this particular aspect. As regards raw materials, the German manufacturer might be said to be well supplied, although as regards fuel, supplies of hard coal were not so well distributed as in England. The Lausitz district, for instance, had depended almost entirely for its fuel supplies on the enormous beds of brown coal situated thereabouts. In respect of other raw materials, Germany was particularly fortunate. German glass making had not undergone anything like such drastic changes since the war as had been the case in England. In Germany sheet-glass was still being produced by methods which did not involve continuous operation. The general expectation, however, seemed to be that within a year or two the hand production of sheet glass would be a negligible quantity. In the making of electric-light bulbs, automatic equipment was only just being installed. In the bottle section, conservatism was far deeper than in any other branch of the industry. The machines which had been developed were largely of the semi-automatic type. It was noticeable that something had been done directly and definitely during the last four or five years to encourage research work in glass technology. In this connexion such institutions might be mentioned as that at Zwiesel: a trade school in Bavaria in which technique played a part; the technical school at Karlsruhe in which, in 1923, there was set up a department of glass technology; the high school at Hanover, where there was a section devoted to glass and ceramics; and the department of silicates which was opened in May, 1926, at the Kaiser Wilhelm Institute in Berlin.

"Developments in the glass industry in Russia," by Prof. J. F. Ponomareff (Tomsk, Siberia).—One of the many difficulties encountered was the great distances which separated the various factories. Many works were run without having any technical or trained men in authority. The supplies of raw materials were good, there being plentiful deposits of sand and limestone. Sodium sulphate was obtained cheaply by evaporation from natural lakes. Since the revolution the number of glass factories had been reduced from 200 to 100; some 40,000 labourers were now employed.

Owing to lack of time, the reading of the following paper was postponed, namely, "The thermal expansions of some boric oxide containing glasses," by Prof. W. E. S. Turner and F. Winks, M.Sc.Tech.

THE INSTITUTION OF CHEMICAL ENGINEERS

The Institution of Chemical Engineers announces that examinations for the Associate-membership of the Institution will be held in June and July next.

Particulars of the examinations and the memorandum on "The training of a chemical engineer" may be obtained on application to the Hon. Registrar, C. S. Garland, Esq., The Institution of Chemical Engineers, Abbey House, Westminster, London, S.W. 1. Applications for entry must be received not later than May 1, 1927.

PHYSICAL SOCIETY

At the meeting held on January 28, Prof. A. O. Rankine and J. W. Avery submitted a paper on "Electrical polarisation in selenium cells and the effects of desiccation," in which it was shown that certain electrical polarisation effects exhibited by the Thirring type of selenium light-sensitive cell were attributable to the deposition of an invisible water film upon the surface of the cell. That this film was the principal seat of the polarisation was proved by the almost complete disappearance of the polarisation effects on prolonged drying of the cell. The light-sensitivity of the cell was very considerably increased by such drying.

Series in the spectra of doubly-ionised gallium and indium, and in the spectrum of ionised tin (Sn III) were discussed in two papers presented by K. R. Rao.

Dr. Ezer Griffiths discussed some of the physical problems connected with the transport by sea of cargoes of apples from Australia to this country. Such cargoes are stored in boxes in holds which are artificially cooled. Apples during storage generate very considerable volumes of carbon dioxide, and are extremely liable to become diseased unless the carbon dioxide content and temperature of the atmosphere in which they are stored are suitably controlled. Methods of exercising such control and of determining the measure of efficiency of the system of control installed were illustrated.

ADVISORY COMMITTEE ON FERTILISERS AND FEEDING STUFFS

The Advisory Committee provided for in section 23 of the Fertilisers and Feeding Stuffs Act, 1926, has now been appointed jointly by the Minister of Agriculture and Fisheries and the Board of Agriculture for Scotland. Its constitution is as follows:—

Lord Clinton (chairman), Mr. E. Richards Bolton, F.I.C., Mr. E. G. Haygarth Brown, I.S.O., Dr. C. Crowther, Mr. J. Garton, Mr. C. W. Higgs, Mr. A. Holgate, Mr. T. Kyle, Mr. Alexander Main, M.A., B.Sc., Mr. J. C. Menzies, Mr. Brian S. Miller, Lieut.-Col. R. L. Norrington, C.M.G., Mr. J. W. Pearson, Mr. R. R. Robbins, C.B.E., Dr. G. Scott Robertson, D.Sc., Sir E. J. Russell, D.Sc., F.R.S., Mr. J. Speir, Mr. G. Stubbs, C.B.E., F.I.C., Dr. J. F. Tocher, F.I.C., Dr. J. A. Voelcker, and Prof. T. B. Wood, C.B.E., F.R.S. Mr. H. J. Johns, Ministry of Agriculture and Fisheries, 10, Whitehall Place, S.W. 1, is the secretary.

The immediate duties of the committee will be to prepare recommendations as to the regulations which will require to be made before the Act can come into operation, and to consider a number of suggestions with regard to the contents of the schedules to the Act.

CORRESPONDENCE

ECONOMIC QUESTIONS

SIR,—Among the many pearls of wisdom cast before your readers week by week there is one which should merit particular appreciation and attention. I refer to the suggestion, made in your editorial of February 11, for a section of the Society of Chemical Industry devoted to the study of economic questions.

Recent discussions about the commercial abilities of chemists and the chemical abilities of industrialists are symptomatic in showing that there is still considerable uncertainty and difference as to the relative proportions of commerce and chemistry that are required to produce men suitable for occupying responsible positions in chemical industry.

The position in this case is closely analogous to that which existed some years ago with reference to the chemical engineer. As a result of the formation of the Chemical Engineering Group, followed by that of the Institution of Chemical Engineers, a definite conception has arisen of the functions and the requirements of the chemical engineer. The old controversy, of which so much was heard at one time, of the engineering inadequacies of the chemist and the chemical inadequacies of the engineer has died since it has been realised that a mixture of chemistry and engineering according to various recipes would not solve the difficulty, and that the only solution lay in a definite synthesis of the two sciences to form a compound with properties differing from those of the component molecules.

An economic or commercial section (the exact term is not of great importance) could perform a similar function in facilitating the exchange of ideas and crystallising opinion, in addition to its obvious educational value through lectures and discussions.

There is no doubt—or, at least, there should not be any—that some such result would be of distinct value in the development of the chemical industry, and it would be of extreme interest to hear the opinion of your readers, especially those who are more qualified to speak than myself, as to the practical steps best calculated to produce this desirable result.

Yours faithfully,

A. J. V. UNDERWOOD

PHOTOGRAPHIC SENSITIVITY

SIR.—I venture to suggest that the report, given on pp. 149–150 of the February 18 issue of the JOURNAL OF THE SOCIETY OF CHEMICAL INDUSTRY, of my lecture on "Photographic sensitivity" would have been correct if it had stopped at the end of the first paragraph. The second paragraph does not give a true idea of the subject of the lecture, and conveys false impressions. There are some 500 to 5000 millions (5×10^8 – 5×10^9) of grains per sq. in. of surface, and not 500 to 5,000,000. The statement that I gave an account of some of the more recent theories of the action of light in relation to crystal structure does not give a true idea of my remarks.

Yours faithfully,

T. SLATER-PRICE

MEMORIAL TO FARADAY

SIR,—Will you kindly permit me to invite the interest of your readers in the following?

The progress of electrical science and industry in the past century is founded largely upon the results of the labours of the illustrious natural philosopher, Michael Faraday, whose experimental researches and discoveries opened wider the power-houses of nature and pointed the way to the utilisation of the forces stored therein, as evidenced by the present universal application of them, particularly electricity, in the service of mankind, and who, in the words of Sir Oliver Lodge, initiated a whole new profession electrical engineering, while Sir Richard Gregory in a recent presidential address declared that "every dynamo in the world owes its origin to Faraday." In his lifetime he was described as "our great electrician."

Michael Faraday, to whom the world thus owes so large a debt of gratitude, was born in Southwark, the son of a blacksmith whose forge stood near the well-known local landmark, the "Elephant and Castle."

To commemorate this great pioneer worker, who, in the world of science holds a place almost equivalent to that of Shakespeare in the world of literature, the Southwark Borough Council desire to form a special collection of standard and current literature on electrical and allied sciences in the Central Reference Library of the borough, which is situated close to the spot where the forge stood.

It is suggested that the memorial shall include also a bust of Faraday.

The use of the library is not limited to local residents, but like the benefits of Faraday's discoveries is open to all. Moreover, it is centrally and conveniently situated near the junction of all the main thoroughfares of populous South London converging upon the principal London bridges; and it is well used—there was an issue of over 100,000 volumes last year.

It is purposed to create a Faraday Memorial Library Fund, the income from which would be expended in the acquisition of the best new books year by year and so keep the Memorial Collection always abreast of developments in, and practical applications of, the sciences for which Faraday did so much.

The Council would welcome the co-operation of electricians and scientists generally, many of whom it is believed would be glad to know of this opportunity to assist, if only in a small measure, in establishing in Faraday's native borough a memorial that will be worthy, permanent, and increasingly useful in character.

The year 1927 has been described as the "dawn of Britain's electrical age," and the time would thus seem appropriate to pay tribute to the memory of the man who made the "electrical age" possible.

The project has the interest and generous support of, among others, the Royal Society, the Royal Institution, Messrs. Benn Bros., the British Electrical and Allied Manufacturers' Association, the Eastern Telegraph Co., the British Thomson-Houston Co., the General Electric Co., the Western Union Telegraph Co., Provincial Tramways Co., Ltd., Messrs. J. Dewrance & Co., Ltd., the County of London Electric Supply Co., the City of London Electric Light Co., the Edison Swan Electric Co., Messrs.

W. H. Willcox & Co., Ltd., Sir R. A. Hadfield, Bart., F.R.S., and a number of private individuals.

I shall be happy to acknowledge any contributions which may be sent to the Town Hall, Walworth Road, S.E. 17.

Believe me,
Yours faithfully,
T. E. HEWITT,
Mayor

Southwark Town Hall

PERSONAL AND OTHER ITEMS

The President and Council of the Royal Society decided at a recent meeting to recommend for election into the Society the following fifteen candidates:—Prof. Edward Victor Appleton, Prof. T. G. Brown, Mr. R. Higgins Burne, Dr. J. Chadwick, Dr. G. M. B. Dobson, Dr. S. Z. de Ferranti, Prof. J. Kendall, Prof. P. P. Laidlaw, Prof. A. A. Lawson, Dr. J. W. Mellor, Dr. O. Rosenheim, Prof. M. Saha, Prof. J. S. B. Stopford, Dr. H. H. Thomas, and Mr. C. M. Kenyon.

The Research Medal of the Worshipful Company of Dyers has been awarded to Dr. H. H. Hodgson for his papers on "The behaviour of the sulphides of sodium in aqueous and alcoholic medium," and on "The action of sulphur on the monochloroanilines." Dr. Hodgson's investigations were carried out in the Department of Colour Chemistry of the Technical College, Huddersfield. The medal is awarded each year for the best scientific research or technical investigation submitted to the Society of Dyers and Colourists for publication in its Journal.

Mr. A. Sciver, B.Sc., A.I.C., has been appointed junior partner in the consulting practice of Drs. S. and E. K. Rideal. Mr. Sciver is also lecturer on bacteriology applied to chemistry at the Battersea Polytechnic.

Dr. J. A. Murray has been elected president of the Royal Microscopical Society, and Mr. A. Chaston Chapman, F.R.S., has been elected a vice-president.

The Bureau of Chemical Abstracts has appointed Mr. F. G. Crosse, F.I.C., to be Assistant Editor in charge of British Chemical Abstracts "B" (Applied Chemistry).

Mr. A. Spyer has been appointed general manager of Messrs. Babcock & Wilcox, and Mr. C. S. Davy assistant general manager.

Mr. F. S. Hooker, chairman of the Rubber & Industrial Trust, has joined the board of the Cheshire United Salt Company.

Dr. W. D. Coolidge has been awarded the Edison medal of the American Institute of Electrical Engineers for the production of ductile tungsten and the fundamental improvement of the X-ray tube.

Mr. Russell R. Brown has been elected president of the United States Industrial Alcohol Company. Mr. Brown, who is 34 years of age, was some years with the U.S. Bureau of Internal Revenue, and joined the company as assistant treasurer in 1917.

Mr. J. C. Minor, consulting chemical engineer, has been elected president of the U.S. Compressed Gas Manufacturers' Association.

The late Mr. H. H. Sissons, J.P., chairman of Sissons Bros. & Co., Ltd., paint and varnish manufacturers, left £35,121, with net personalty £28,676.

The late Mr. H. S. Gotts, chairman of Barrett, Tagent & Gotts, Ltd., oil refiners, left £40,474.

The late Mr. H. Probyn, a director of Guest, Keen & Nettlefolds, Ltd., of the Skinningrove Iron Company, and of other companies, left £40,133.

The late Mr. J. W. S. Ashworth, of Radcliffe, Lancs manufacturing chemist, left £84,355, with net personalty £75,243.

Dr. A. Liebmam, who died recently at Weybridge, had been prominently concerned in consulting work connected with chemical patents, especially in relation to dyestuffs. As an expert witness he was frequently associated with the late Sir James Dewar, with whom he carried out many investigations in the laboratories of the Royal Institution.

Inquiry into Coal Transport

The Minister of Transport and the Secretary for Mines have appointed a standing committee, the Standing Committee on Mineral Transport, to review the equipment for the transport of coal and, with special reference to the recommendations of the Royal Commission on the Coal Industry, to devise means that will lead to the greatest efficiency and economy in transport and be of mutual advantage to the coalmining industry and the transport agencies; to report upon the steps taken and upon any further measures necessary from time to time, and generally to watch over the matter. The chairman of the Committee is Sir Arthur Duckham, K.C.B., M.I.C.E., M.I.Chem.E., who is chairman of the Woodall-Duckham companies, and has a distinguished record of public service on the Air Council, the Coal Industry Commission, and the Ministry of Munitions. The members of the Committee include representatives of the Ministries concerned, the railways, and other transport agencies, coal producers and merchants, and labour.

Proposed Representative Body for Scientific Workers

An appeal has been sent from the National Union of Scientific Workers to all professionally qualified men of science and technicians in the country, with the object of obtaining their views "on the possibility and desirability of building up a body fully representative of their broader interests." The appeal bears the signatures, with many others, of Dr. E. F. Armstrong, F.R.S., Sir William Beveridge, Sir William Bragg, Prof. F. G. Donnan, Prof. W. H. Eccles, Sir Richard Gregory, Dame Helen Gwynne-Vaughan, Sir Robert Hadfield, Lord Haldane, Sir Hugo Hirst, Sir Thomas Holland, Sir F. Gowland Hopkins, Sir Max Muspratt, Mr. Ormsby-Gore, M.P., Under-Secretary of State for the Colonies, Sir Charles Parsons, Sir Horace Plunkett, Sir Humphry Rolleston, Sir Charles Sherrington, Sir Arthur Shipley, Mr. H. G. Wells, and Prof. Julian S. Huxley.

Long Service under Brunner, Mond & Co.

On February 18, Messrs. Brunner, Mond & Co. presented 36 gold medals, 123 gold watches, and 133 silver watches to employees with 40, 35, and 25 years' service respectively. Up to date 240 men have completed 40 years' and 768 have completed 35 years' service.

REVIEW

TUNGSTEN: A TREATISE ON ITS METALLURGY, PROPERTIES AND APPLICATIONS. By COLIN J. SMITHELLS, M.C., D.Sc. Pp. vii + 167. London: Chapman & Hall, Ltd., 1926. Price 21s.

Most of the tungsten produced is in the form of an amorphous powder somewhat resembling lamp black and finds its way into steel, but in this aspect of his subject Dr. Smithells has no more than a passing interest, his main concern being with the tungsten wire, rod and sheet of the electric lamp manufacturer. In this sense tungsten is the product of the last twenty years, and a summary of the present state of our knowledge is opportune, especially as the author has endeavoured to collate all the important work up to the end of 1925, and has manifestly succeeded. A careful account is given of the quasi-laboratory methods employed for getting the very pure tungstic oxide (99.9 to 99.95%) which is an essential preliminary for success in the subsequent mechanical working of the metal. This holds good even when certain impurities such as thorium are afterwards added to the purified oxide to modify the properties of tungsten used for lamp filaments. It is somewhat surprising to read on page 19 that the amber colour of some ammonium tungstate solutions is due to dissolved iron, the author being apparently unaware that vanadium and not iron is the cause of the colour. Two important chapters are devoted to the reduction of tungstic oxide and to the manufacture of ductile tungsten. In the former the work of Chaudron and van Liempt receives attention, though that of Wöhler and his colleagues on the equilibria of tungsten and its oxides is not mentioned. All the illustrations of plant show the methods used by the company with which the author is associated, and should be regarded as convenient examples of the kind of apparatus employed rather than as strict types. Considerable space is devoted to the author's own work on the metallography of tungsten, and many excellent photomicrographs are included. Most of the other important contributions to the subject have also been summarised. A mass of data on the properties of tungsten has been collected together, special stress being laid on those properties affecting the operation of tungsten at high temperatures. The method of citing the American Chemical Abstracts is useful, but sometimes trips up the author, as when he quotes the U.S. Patent for the Jacoby process and omits all reference to several cognate British specifications.

There are very few misprints, though on page 10 we have FeWO_3 & MnWO_3 for FeWO_4 & MnWO_4 ; on page 13 "oxidisation" for oxidation, and on page 29 "phosphorous" for phosphorus.

Anyone desiring to become acquainted with the remarkable progress made in connexion with ductile tungsten during recent years can be confidently recommended to read this book.

P. D. OAKLEY

A faculty of mechanical engineering and mining chemistry and technique is to be founded in the University of Münster (Westphalia) at a cost of £75,000.

PARLIAMENTARY NEWS

Lead Poisoning

In reply to Major Hills, Sir W. Joynson-Hicks said that during the years 1916—1926 there were 67 cases of lead poisoning in the Potteries in factories using low-solubility glazes since the Regulations of 1913, which gave special exemption to such factories. This was out of a total of 351, and in 60 out of the 67 cases there had been previous employment, often for many years, in factories using raw lead glazes. An investigation by one of the medical inspectors is to be carried out shortly regarding lead poisoning in potteries of this class.—February 14.

Poison Gases

The Prime Minister informed Mr. Hudson that until such time as a definite assurance could be obtained that all Powers would adopt measures of prohibition in regard to poisons and bacteria, H.M. Government must take steps to be in a position to defend itself against such attacks. Research work for this purpose would therefore be continued.—February 15.

Beet-Sugar Industry

Answering Mr. Gillett, Mr. Guinness said that fourteen beet-sugar factories in Great Britain received subsidy in the 1926-27 campaign, and about 6,500 persons were employed in these factories. The area under sugar-beet in 1926 was 129,463 acres.

Moving that a supplementary sum, not exceeding £450,000, be granted in respect of the sugar beet subsidy, Mr. Guinness said the reason for this supplementary vote was that, during the current season, a very high rate of production had been reached—about an extra ton per acre on 130,000 acres under beet cultivation as compared with last year. In addition, the demand of the factories on the vote had been increased by the better sugar content of the crop, which this year was estimated at about 17% as against 16.3 last year. The bill was a debt of honour under the Act of 1925, and was really a cheap charge for the creation of a new industry at private risk. The vote was put and agreed to.—February 15 and 16.

Safeguarding of Industries (Leatherette)

Replying to Sir H. Cowan, Sir P. Cunliffe-Lister said that paper of a packing or wrapping description which has been coated or treated was subject to duty, and that the duty also applied to articles made either from such paper, or from such paper with the addition only of some adhesive substance or other material, the value of which did not exceed one-sixth of the total value of the whole article. It was a mistake to suppose that leatherette was not made in this country.—February 17.

Effluents from Sugar-Beet Factories

Mr. Guinness informed Mr. Hurd that reports had been obtained from all the principal beet-growing countries, but so far no remedy had been found for overcoming the difficulties which confront sugar manufacturers in the disposal of effluents. The information contained in the reports, however, might facilitate scientific investigations which were being conducted by the

manufacturers and the Government in co-operation. A summary of the information acquired from abroad was furnished to each factory some months ago, and the same action will be taken with regard to the more recent information received.—February 21.

Sale of Food and Drugs Bill

This Bill was read a second time and committed to a Standing Committee.—February 21.

COMPANY NEWS

COURTAULDS, LTD.

The profits for 1926, after charging all taxation, depreciations and expenses, amounted to £3,840,791, compared with £4,411,413 for 1925, when £400,000 was placed to insurance reserve. It has been decided to carry £750,000 to general reserve account, which will also benefit by a sum of £1,250,000 transferred from taxation reserves as no longer required. A final dividend has been recommended on the ordinary shares of 3s. 3d. per share, free of income tax, making 4s. 6d. or 22½% for the year, compared with 25% for 1925.

UNITED TURKEY RED CO., LTD.

A dividend has been recommended of 5% on the ordinary shares for 1926, compared with 10% for 1925, carrying forward approximately £36,900.

BRITISH VISADA ARTIFICIAL SILK CO., LTD.

The first report and statement of accounts has been issued, covering a period from October 15, 1925—the date of incorporation—to December 31, 1926. As the whole of this period was employed in bringing the factory to a state of production, no profit and loss account is shown. Assets are shown in the balance sheet at £377,073, of which £107,486 is in the form of cash. Plant and machinery account for £160,504, buildings etc. for £70,343, and preliminary and formation expenses for £33,143. Sundry creditors at £17,073 is the only current liability.

MELSO, LTD.

Owing to the strikes, the net trading profit for 1926 amounted to £32,198, against £53,220 for 1925. A dividend has been recommended of 7½% (compared with 10%) on the preference and ordinary shares, carrying forward £8,540. The directors report that with the return to normal conditions the business has shown a marked improvement.

SNIA VISCOSA CO., LTD.

A dividend of 10% has been declared for the year ended December 31, 1926. In pursuance of the working agreement recently arrived at between this company, Courtaulds, and Glanzstoff, the following appointments to the board have been made:—Dr. F. Bluthgen, representing Vereinigte Glanzstoff Fabriken, Elberfeld; Mr. E. Lunge, representing Courtaulds (London).

MATHER AND PLATT, LTD.

A dividend has been recommended on the ordinary shares of 10% per annum, together with a bonus of 5%, both free of tax, less the interim dividend of 5% already paid (same for 1925), leaving £164,458 to be carried forward, against £178,281 brought in.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
Bisulphite of Lime—£7 10s. per ton, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
Copper Sulphate.—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammiac.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included. Sod. Chlorate.—2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.r. London, casks free. Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton. Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
Arsenic, Sulphide, Yellow.—2s. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 2d. per lb.
Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbanilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 5s. per ton. Good demand. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£7—£10 per ton, according to grade and locality. Quiet.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—1s. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 4s. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P. Both in good demand.
 Wood Tar.—£4—£5 10s. per ton and upwards, according to grade. Better demand.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carboic.—Crystals, 6d. per lb. Crude 60's, 1s. 8½d.—1s. 9½d. per gal.
 Acid Cresylic, 99/100.—2s. 3d.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 1d. per gal. Pale, 95%, 1s. 10d.—2s. per gal. Dark, 1s. 9d.—1s. 10d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 3d.—1s. 4d. per gal., ex works in tank wagons; Standard motor, 1s. 11d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s. 2d.—2s. 5d. per gal., ex works in tank wagons.
 Tolnole.—90%, 1s. 11½d. to 2s. 3d. per gal. Firm. Pure, 2s. 2½d.—2s. 6d. per gal.
 Xylol.—2s. 3d.—2s. 6d. per gal. Pure, 4s. per gal.
 Creosote.—Cresylic 20/24%, 10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal.
 Naphtha.—Crude, 9½d.—1s. 0½d. per gal., according to quality. Solvent 90/160, 2s.—2s. 1d. per gal. Solvent 95/160, 1s. 9d.—1s. 10d. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s. per ton.
 Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—105s.—115s. per ton, f.o.b. according to district.
 Pyridine.—90/140.—9s. 6d.—13s. per gal. Nominal. 90/180.—7s. 6d. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7d. per lb., naked at works.
 Aniline Salts.—7d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d.—4½d. per lb.
 m-Cresol 98/100%.—2s. 8½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—7d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 4d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4½d.—2s. 6d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots—1s. per oz.
 Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 3½d.—1s. 4½d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4d.—1s. 5d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 1d. per lb. Less 5%. Firmer market.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—11s. 3d.—11s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Aspirin.—2s. 4d. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.

Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 4d.—2s. 6d. per lb. Potassium.—1s. 11d.—2s. 1d. per lb. Sodium.—2s. 2d.—2s. 4d. per lb. All spot.

Calcium Lactate.—1s. 4d.—1s. 5d. per lb.

Chloral Hydrate.—3s. 2d.—3s. 5d. per lb., duty paid.

Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.

Creosote Carbonate.—6s. per lb.

Ether meth.—1s. 1d.—1s. 11¼d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.

Formaldehyde.—£30 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—6s. 6d.—7s. per lb.

Hexamine.—2s. 4d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.).—1s. 5d. per gal. f.o.r. makers' works, naked.

Hydroquinone.—4s. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—22s. per cwt., 112 lb. lots.

Magnesium Carbonate.—Light Commercial £33 per ton net.

Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%, in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 12s.—13s. per lb., according to quantity; Liquid (95%), 12s. per lb. Detached cryst., 14s. 6d. per lb.

Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb., Levig. 6s. 1d. per lb.; Corrosive sublimate, Lump, 4s. 8d.—4s. 10d. per lb., Powder, 4s. 7d. per lb.; White precip., Lump, 4s. 10d.—5s. per lb., Powder, 5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d. per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide, 5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d. per lb.; Sulph. nig., 4s. 10d.—4s. 11d. per lb.

Methyl Salicylate.—1s. 6d.—1s. 9d. per lb.

Methyl Sulphonal.—15s.—15s. 3d. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s.—1s. 4d. per lb.

Phenacetin.—3s. 9d.—4s. per lb.

Phenazone.—5s. 9d.—6s. per lb.

Phenolphthalein.—6s.—6s. 3d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 90s. per cwt., less 2½% for ton lots.

Potass. Citrate.—1s. 11d.—2s. 2d. per lb.

Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins.

Resorcin.—4s. per lb. spot.

Saccharin.—55s. per lb.

Salol.—3s.—3s. 3d. per lb.

Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 2d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—77s. 6d.—82s. 6d. per cwt. net, according to quantity.

Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal 1s. 10d.—1s. 11d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.

Sulphonal.—10s.—10s. 3d. per lb.

Tartar Emetic B.P. cryst. or powder.—1s. 10d.—2s. 1d. per lb.

Thymol, Puriss.—11s. 9d.—13s. 9d. per lb., according to quantity. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.

Aubepine (ex Anethole).—10s. 3d. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb. Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.

Cinnamic Aldehyde.—Natural, 17s. per lb.

Coumarin.—10s. 9d. per lb.

Citronellol.—15s. per lb.

Citral.—9s. 6d. per lb.

Ethyl Cinnamate.—10s. per lb.

Ethyl Phthalate.—3s. 3d. per lb.

Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—19s. per lb. Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol (ex Shui Oil) 12s. per lb.—(ex Bois de Rose) 16s. per lb. Linalyl Acetate.—(ex Shui Oil) 14s. 6d. per lb.—(ex Bois de Rose) 18s. per lb.

Methyl Anthranilate.—9s. per lb.

Methyl Benzoate.—4s. 6d. per lb.

Musk Ketone.—30s. per lb.

Musk Xylol.—8s. 6d. per lb.

Nerolin.—3s. 9d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—11s. per lb.

Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 6d. per lb. Vanillin.—10s. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—30s. per lb. Bourbon Geranium.—11s. 3d. per lb.

Camphor.—63s. 6d. per cwt. Cananga, Java, 20s. per lb. Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure—6s. per lb.

Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 20s. 9d. per lb. Lemon.—9s. 6d. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb. Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 22s. per lb. Japanese, 8s. 6d. per lb. Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than April 18th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Mar. 3rd. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Arnot. Metallic fabric etc. for chemical etc. industries. 3377. Feb. 7.

Cryer and Hill. Grinding and mixing mills. 3632. Feb. 9.

Goldman. Mixing machines etc. 3556. Feb. 8. (Belg., 9.3.26.)

Gordon & Co. (Hagan Corp.). Extraction of extraneous material from fluids or gases. 3724—5. Feb. 9.

Hünsl. Grinding mills. 3820. Feb. 10.
Henshaw, Holmes, and Holmes & Co. Apparatus for bringing liquids and gases into intimate contact. 3467. Feb. 7.

Kirk and Martinez. Crushing and mixing mills. 3607. Feb. 8.

I.—Complete Specifications

19,840 (1925). Marks (Tracy Engineering Co.). Fluid separators. (265,250.)

932 (1920). White (Gas Research Co.). Transferring heat. (265,358.)

3009 (1926). Internat. Combustion, Ltd., and Rosencranz. See II.

3937 (1926). Whitehead. Mixing apparatus. (265,382.)

9518 (1926). Robertson. Furnaces. (265,422.)

15,373 (1926). Minter. Drying apparatus. (265,449.)

19,552 (1926). Bentley. Rotary kilns and furnaces. (265,462.)

*352 (1927). Habermann. Centrifugal driers and separators. (265,561.)

*3116 (1927). Hadamovsky. Heating, melting, evaporating, or cooling vessel. (265,597.)

II.—Applications

Barry. Distillation of coal etc. 3726. Feb. 9.

Cooper. Treatment of gases arising from distillation of coal etc. 3913. Feb. 11.

Elektronmetall Ges. Apparatus for purifying oil etc. 3795. Feb. 10. (Ger., 8.10.26.)

Fenby. Solid fuel. 3541. Feb. 8.

I.-G. Farbenind. Catalytic oxidation of carbon monoxide. 3429. Feb. 7. Decomposition of hydrocarbons. 3903. Feb. 11. (Ger., 11.2.26.)

Jansen. Apparatus for cracking hydrocarbons. 3477. Feb. 7.

Lamberty. Distillation of coal etc. 3726. Feb. 9.

Nederlandsche Mijnbouw en Handel Maatsch. Manufacture of alkaline coke. 3926. Feb. 11. (Ger., 12.2.26.)

N. V. Silica en Ovenbouw Maatsch. Recovery of benzenes from coal gas. 3887. Feb. 11. (Ger., 12.2.26.)

Salerni. Apparatus for distilling carbonaceous materials. 3565. Feb. 8.

Smallwood. Making fuel briquettes etc. 3397. Feb. 7.

Soc. des Brevets Etrangers Lefranc et Cie. Liquid fuel for internal-combustion engines. 3916. Feb. 11. (Fr., 3.4.26.)

III.—Complete Specifications

32,065 (1925). South Metropolitan Gas Co., and Evans. Manufacture of coal gas. (265,349.)

3009 (1926). International Combustion, Ltd., and Rosencranz. Apparatus for drying coal etc. (265,374.)

3160 (1926). Braunkohlen-Produkte A G., Bube and Erlenbach. Obtaining low-boiling hydrocarbons etc. from bituminous materials. (265,375.)

7186 (1926). Lederer. Production of carbon. (251,244.)

12,313 (1926). Meiro. Fractional distillation of solid fuels at a low temperature. (265,435.)

*3429 (1927). I.-G. Farbenind. Catalytic oxidation of carbon monoxide. (265,624.)

III.—Application

N. V. Silica en Ovenbouw Maatsch. 3887. See II.

IV.—Applications

British Dyestuffs Corp. Baddiley, Dootson, Shepherdson, and Thornley. Manufacture of dyestuffs. 3609. Feb. 8.

British Dyestuffs Corp., Bunbury, Evans, and Shepherdson. Manufacture of vat dyestuffs. 3713. Feb. 9.

Geigy A.-G. Manufacture of acid dyestuffs. 3890. Feb. 11. (Ger., 13.2.26.)

I.-G. Farbenind. Production of primary aliphatic etc. amines. 3430. Feb. 7. (Ger., 9.2.26.) Manufacture of vat

dyestuffs. 3559. Feb. 8. (Ger., 9.2.26.) Manufacture of solid diazo salts. 3889. Feb. 11. (Ger., 12.2.26.)

IV.—Complete Specifications

18,597 (1925). Drescher, Smith, Thomas, and Scottish Dyes, Ltd. Production of anthraquinone derivatives. (264,916.)

25,406 (1926). Ransford (Cassella & Co.). See XX.

*32,187 (1926). Newport Co. Tetrakisazo dyes. (265,553.)

*3134 (1927). I.-G. Farbenind. Manufacture of condensation products from naphthalene or naphthalene derivatives and ethylene. (265,601.)

V.—Applications

British Celanese, Ltd., and Olpin. Treatment of materials containing cellulose derivatives. 3652. Feb. 9.

British Dyestuffs Corp., and Hollins. Manufacture of wool, fur, etc. 3714. Feb. 9.

Carpmael (I.-G. Farbenind.). Manufacture of cellulose esters etc. 3595. Feb. 8.

Chavassieu. Manufacture of artificial textile threads etc.

3832. Feb. 10. (Fr., 3.4.26.)

Comptoir des Textiles Artificiels. Manufacture of artificial textile threads etc. 3832. Feb. 10. (Fr., 3.4.26.)

Dreyfus. Treatment of materials containing cellulose derivatives. 3653. Feb. 9.

Gallert. Treatment of artificial silk yarns after spinning. 3738. Feb. 10.

Klotz. Manufacturing transparent papers. 3421. Feb. 7.

Silver Springs Bleaching & Dyeing Co., and Hall. Rendering cellulose acetate yarn etc. resistant to deterioration. 3499. Feb. 8.

Soc. des Brevets Etrangers Lefranc et Cie. Hydrolysis of cellulose substances. 3917. Feb. 11. (Fr., 20.5.26.)

Verein. Glanzstoff-Fabriken. Means for treating artificial silk. 3991. Feb. 12. (Ger., 13.2.26.)

Wade (Bouwonderrening Ketabang IV). Apparatus for manufacture of artificial silk threads. 3708. Feb. 9.

V.—Complete Specifications

25,161 (1925). Levy and Silberrad. Manufacture of cellulose acetate. (265,267.)

24,345 (1926). Carpmael (I.-G. Farbenind. A.-G.). Manufacture of benzyl celluloses. (265,491.)

*2413 (1927). Syntheta A.-G. Manufacture of artificial silk. (265,577.)

VI.—Applications

Butterworth and Butterworth. Production of solid shades on mixed fibres. 3757. Feb. 10.

Janvier. Rendering cotton fibre, yarn, etc. fireproof. 3756. Feb. 10.

Rohm & Haas Co. Bleaching etc. textile fabrics. 3585. Feb. 8. (U.S., 25.2.26.)

Wilkinson. Dyeing textile fabrics etc. 3976. Feb. 12.

VI.—Complete Specifications

29,781 (1925). Dehn (Stein Fur Dyeing Co., Inc.). Bleaching and dyeing furs. (265,324.)

9196 (1926). Benekiser, Reimann, Reimann, and Draibach. Stabilisation of bleaching baths. (265,417.)

15,964 (1926). Fruh. Wet treatment of textile fabrics. (254,706.)

VII.—Applications

Bentley, Catlow, and Blythe & Son. Purification of sulphur. 3946. Feb. 12.

Geffcken and Richter. Devices for activating oxygen etc. 3564. Feb. 8. (Ger., 8.2.26.)

I.-G. Farbenind. 3429. See II.

Leemans. Manufacture of sulphuric acid. 3907—8. Feb. 11.

New Jersey Zinc Co. Manufacture of zinc oxide. 4002. Feb. 12. (U.S., 27.3.26.)

VII.—Complete Specifications

22,252 (1925). Hammond and Shackleton. Concentration or purification of caustic soda etc. (265,252.)

27,769 (1925). Meister, Lucius & Brining. Separating solid salts of ammonium and of the alkalis or alkaline earths. (242,975.)

28,054 (1925). Coulier. Manufacture of alkali cyanides. (265,305.)

31,951 (1925). Cassella & Co. *See* XX.

1915 (1926). Ebers. Obtaining heavy spar and a paint or a material for the manufacture of cement. (246,498.)

4319 (1926). Deutsche Gold- und Silber-Scheideanstalt, and Freudenberg. Manufacture of alkali metal cyanides. (265,639.)

9196 (1926). Benckiser, Reimann, Reimann, and Draibach. *See* VI.

20,019 (1926). Deutsche Gasglühlicht-Auer-Ges. Producing titanate acid unaffected by light. (257,259.)

*16,394 (1926). Rhenania Verein Chem. Fabr. Manufacture of moulded sulphur. (265,540.)

*2452 (1927). Rosenheim. *See* XXI.

*3429 (1927). I.-G. Farbenind. *See* II.

*3504 (1927). Geffcken and Richter. Devices for activating oxygen etc. (265,636.)

VIII.—Complete Specifications

7043 (1926). Hartford-Empire Co. Glass-annealing lehrs. (250,200.)

15,653 (1926). Scheidhauer & Giessing A.-G. Manufacture of refractory bricks. (253,947.)

IX.—Applications

Bayer. Producing porous materials etc. 3588. Feb. 8. (Denmark, 9.2.26.)

Massie. Colouring magnesium oxychloride cements. 3734. Feb. 10.

Pease. Manufacture of bricks etc. 3697. Feb. 9.

Schmid. Painting and preserving stone, wood, etc. 3457. Feb. 7.

IX.—Complete Specifications

1915 (1926). Ebers. *See* VII.

24,738 (1926). Hertzka. Manufacture of alumina-containing cements. (265,494.)

X.—Applications

Akt. Norsk Staal, and Edwin. Production of synthetic pig iron. 3980. Feb. 12.

Arnot. 3377. *See* I.

Goldschmidt A.-G. Bearing-metal alloy. 3707. Feb. 9. (Ger., 25.2.26.)

Kamishima. Alloy having high electrical resistance. 3676. Feb. 9.

Rowlands. Treatment of ores etc. 3824. Feb. 10.

X.—Complete Specifications

19,239 (1925). Merle. Manufacture of metals. (265,243.)

27,765 (1925). Marks (Grasselli Chemical Co.). *See* XI.

6138 (1926). Internat. Nickel Co. Manufacture of alloys of copper, nickel, and aluminium. (250,194.)

31,237 (1926). Penniman and Shackelford. Decarbonising ferrochrome. (262,795.)

*30,706 (1926). Fourment. Treatment of ores, wastes, etc. (265,548.)

*32,876 (1926). Krupp Grusonwerk. Treatment of zinciferous flying dust. (265,558.)

*1055 (1927). Metallbank u. Metallurgische Ges. Purifying aluminium and its alloys. (265,563.)

XI.—Applications

Kamishima. 3676. *See* X.

Standley. Electric accumulators. 3962. Feb. 12.

XI.—Complete Specifications

27,765 (1925). Marks (Grasselli Chemical Co.). Electrolytic deposition of cadmium. (265,292.)

19,237 (1926). Norske Akt. for Elektrokemisk Ind. Electrodes for electric furnaces. (258,500.)

*3227. (1927). Pechkranz. Electrodes. (265,606.)

XII.—Application

British Drug Houses, Ltd., and Carr. Manufacture of oils containing vitamins. 3440. Feb. 7.

XII.—Complete Specification

12,748 (1926). Petroff. Production of sulpho-aromatic fatty acids. (252,212.)

XIII.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of non-thickening pastes and lacquers. 3473. Feb. 7.

Fraser and Smith. Manufacture of varnishes etc. 3557. Feb. 8.

XIII.—Complete Specifications

1915 (1926). Ebers. *See* VII.

*18,430 (1926). Acheson. Preparing pigment-oil compositions. (265,541.)

*31,278 (1926). New Jersey Zinc Co. Manufacture of lithopone. (265,550.)

XIV.—Applications

Brown. Substitute for rubber, balata, etc. 3378. Feb. 7.

Williams. Coagulating rubber latex etc. 3373. Feb. 7.

XV.—Applications

I.-G. Farbenind. Manufacture of tanning agents. 3802. Feb. 10. (Ger., 23.2.26.)

Massin. Depilating skins etc. 3045. Feb. 9. (Fr., 10.2.26.)

XVI.—Applications

Carpmael (I.-G. Farbenind.). Immunising seed grain etc. 3987. Feb. 12.

Chem. Fabr. vorm. Schering. Preventing loss of carbohydrates in plants when stored. 3702. Feb. 9. (Ger., 26.2.26.)

XVI.—Complete Specification

301 (1926). Siemens & Halske A.-G. Producing artificial manures. (245,768.)

XVIII.—Applications

British Arkady Co., Ltd., Hewitt, and Whympers. Manufacture of fermenting products. 4003. Feb. 12.

Merek. 3721. *See* XX.

XIX.—Applications

Campbell and Pocock. Preserving eggs etc. 3710. Feb. 9. Chem. Fabr. vorm. Schering. 3702. *See* XVI.

Coles. Treatment of milk. 3630. Feb. 9.

Cook and Cook. Preserving etc. food. 3530. Feb. 8.

Matsubara. Treating milk. 3684. Feb. 9. (Japan, 27.2.26.)

XIX.—Complete Specifications

29,689 (1925). White (Merrell-Soule Co.). Treatment of milk powder. (265,323.)

8670 (1926). Kirke. Preserving or improving foodstuffs. (265,416.)

XX.—Applications

British Drug Houses, Ltd., and Carr. 3440. *See* XII.

British Dyestuffs Corp., Saunders, and Wignall. Manufacture of ethylene glycol. 3610. Feb. 8.

Dreyfus. Manufacture of aliphatic compounds. 3551. Feb. 8.

Engelke and Komlos. Manufacture of compounds of carbon and sulphur etc. 3928. Feb. 11. (Ger., 15.2.26.)

I.-G. Farbenind. 3430. *See* IV. 3903. *See* II.

Merck. Dehydrating ethyl alcohol. 3721. Feb. 9. (Ger., 30.10.26.)

Riedel A.-G. Producing adipic acid. 3427. Feb. 7. (Ger., 12.2.26.)

Soc. des Brevets Etrangers Lefranc et Cie. Extraction of butyric acid etc. 3918. Feb. 11. (Fr., 27.8.26.)

XX.—Complete Specifications

24,618 (1925). Long, Willson, and Wheeler. Manufacture of halogenhydrins. (265,259.)

31,010 (1925). Faithfull. Making lactic acid and lactates. (265,336.)

31,951 (1925). Cassella & Co. Manufacture of new complex aurosodium thiosulphate solutions. (246,809.)

5918 (1926). Soc. Chem. Ind. in Basle. Manufacture of quinolinic anhydride. (249,497.)

10,402 (1926). Sartig. De-nicotining tobacco etc. (265,427.)

12,748 (1926). Petroff. See XII.

25,406 (1926). Ransford (Cassella & Co.). Manufacture of aromatic compounds. (265,498.)

28,197 (1926). Chem. Fabr. vorm. Schering. Manufacture of complex metal alcoholates. (261,377.)

*26,212 (1926). Newport Co. Preparing nitroamino-benzoyl-o-benzoic acid and its derivatives. (265,545.)

*1169 (1927). Soc. Chem. Ind. in Basle. Obtaining highly active substances from female internal secretory organs. (265,567.)

*3134 (1927). I.-G. Farberund. See IV.

XXI.—Applications

British Thomson-Houston Co., Ltd., and Hands. Photo-sensitive paper etc. 3612. Feb. 8.

Soc. de Photochimie Elka. Production of pictures on gelatin silver bromide. 3475. Feb. 7. (Fr., 8.2.26.)

XXI.—Complete Specifications

27,825 (1925). Trist. Mercurial printing-surfaces. (265,294.)

*3133 (1927). Wreschner and Loeb. Preparation which emits β -rays. (265,600.)

*3475 (1927). Soc. de Photochimie Elka. Production of pictures on gelatin silver bromide. (265,630.)

XXII.—Complete Specification

3258 (1926). Robinson. Match-striking compositions. (265,378.)

XXIII.—Applications

Bishop, Elsmore, and Holford. Centrifugal apparatus for treatment of sludge. 3825. Feb. 10.

French and Holmes. Bactericidal etc. agents. 3584. Feb. 8.

XXIII.—Complete Specification

*2452 (1927). Rosenheim. Increasing the base-interchange capacity of glauconite. (265,578.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Brazil*: Tinplate, galvanised corrugated iron sheets, ingot and bar lead, heavy chemicals, linseed oil (170). *Egypt*: Photographic material (B.X. 3240); nitrate of soda, nitrate of lime, sulphate of ammonia, superphosphate of lime (C.X. 2196). *Germany*: Technical oils and fats for the soap industry (161). *Rumania*: Yellow and red ochre and iron minium (B.X. 3239); refined white opaque paraffin wax (B.X. 3243); rubber belting (B.X. 3238). *South Africa*: Mild steel plates (A.X. 4254). *United States*: Steel tubing, mild steel channels (A.X. 4257).

PUBLICATIONS RECEIVED

THE PAPER MILL CHEMIST. By H. P. Stevens, M.A., F.I.C. Third edition, revised, Pp. viii + 317. London: Ernest Benn, Ltd., 1926. Price 10s. 6d. net.

COURS DE CHIMIE INORGANIQUE. By F. Swarts. Fourth edition, revised and enlarged. Pp. 786. Brussels: M. Lamertin; Paris: J. Hermann, 1926. Price 72 frs. Belges.

REPORT OF THE MEDICAL RESEARCH COUNCIL FOR THE YEAR 1925—1926. Committee of the Privy Council for Medical Research. Pp. 161. H.M. Stationery Office, 1926. Price 3s. 6d. net.

THE INFLUENCE OF MOLYBDENUM ON MEDIUM CARBON STEELS CONTAINING NICKEL AND CHROMIUM. R. D. Report No. 67. Research Department, Woolwich. 1926. Pp. 58. H.M. Stationery Office, 1927. Price 3s. 6d. net.

HISTORY OF THE SCIENCES IN GRECO-ROMAN ANTIQUITY. By A. Reymond. Translated by Ruth Gheury de Bray. Pp. x + 245. London: Methuen & Co., Ltd., 1927. Price 7s. 6d. net.

COLLECTED PAPERS OF SIR JAMES DEWAR. Edited by Lady Dewar, with the assistance of J. D. Hamilton Dickson, H. M. Ross, and E. C. Scott Dickson. With two supplementary papers not heretofore published, and an appendix and indexes. Vol. I. Pp. xxii + 674. Vol. II. Pp. ix + 675—1489. Cambridge: The University Press, 1927. Price, for the two volumes, £4 4s. (Not sold separately).

HAND-LIST OF SHORT TITLES OF CURRENT PERIODICALS IN THE SCIENCE LIBRARY. Edited by S. C. Bradford, D.Sc. Board of Education. Fourth edition. Pp. 176. H.M. Stationery Office, 1926. Price, 1s. net.

LES ÉTABLISSEMENTS KUHLMANN 1825 1925. Cent Ans D'Industrie Chimique. Compagnie Nationale de Matières Colorantes et Manufactures de Produits Chimiques du Nord Réunies. Pp. 137. Paris: Établissements Kuhlmann, 1926.

PUBLICATIONS OF THE UNITED STATES DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, WASHINGTON: Government Printing Office, 1926:—Recent Developments in Lamp Life-Testing Equipment and Methods. By J. F. Skogland and R. P. Teele, Jr. Technologic paper No. 325. Pp. 681-702. Price 15 c. Supplement to Circular No. 25. Standard samples issued or in preparation. Pp. 7. United States Government Master Specifications:—No. 268A for Brick, Fire-clay. Circular No. 299. Price 5 c. Testing of Thermometers (4th edition, 1926). Circular No. 8. Pp. 18. Price 10 c. No. 429 for Ash, Soda. Circular No. 314. Price 5 c. No. 432 for Sodium Carbonate Granular (Monohydrate Crystals). Circular No. 317. Price 5 c. No. 414 for Matting, Rubber, for use around electrical Apparatus or Circuits not exceeding 3,000 volts to Ground. Circular No. 312. Price 5 c. No. 33A for Soap Cake, Grit. Circular No. 130. Price 5 c. No. 430 for Soda, Caustic (Lye) (For Cleaning Purposes). Circular No. 315. Price 5 c. No. 431, for Soda, Laundry (Washing Soda). Circular No. 316. Price 5 c. Technologic Paper No. 328. Tests of Large Columns with H-Shaped Sections. By L. B. Tuckerman and A. H. Stang. Pp. 88. Price 40 c. Asphalt. Simplified Practice Recommendation No. 4. Elimination of Waste. Pp. 11. Price 5 c. A Primer of Simplified Practice. By E. L. Priest. Elimination of Waste. Pp. iv + 58. Price 15 c. Sterling Silver Flatware. Simplified Practice Recommendation No. 54. Elimination of Waste. Pp. 12. Price 5 c. Tissue Paper. Simplified Practice Recommendation No. 46. Elimination of Waste. Pp. 7. Price 5 c.

JOURNAL of THE SOCIETY OF CHEMICAL INDUSTRY CHEMISTRY & INDUSTRY

Official Organ of the Institution of Chemical Engineers of the Coke Oven Managers' Association, and of the Federal Council of Pure and Applied Chemistry

which consists of Representatives from

The Chemical Society, the Society of Chemical Industry, the Association of British Chemical Manufacturers, the Institute of Chemistry, the Society of Public Analysts, the Faraday Society, the Institute of Brewing, the Society of Dyers and Colourists, the Society of Glass Technology, the Iron and Steel Institute, the Ceramic Society, the Institution of Gas Engineers, the Society of Leather Trade Chemists, the Royal Photographic Society, the Mineralogical Society, the Biochemical Society, the Oil and Colour Chemists' Association, the Institute of Metals and the Royal Agricultural Society.

LONDON, MARCH 4, 1927

No. 9

EDITORIAL

Biochemistry

THERE is always a very pleasant atmosphere at the meetings of the Royal Society of Arts. The subjects which are chosen for the meetings are such that thinking people must go to John Street to learn more about them, and so not only are the audiences representative, but the meetings are stimulating to an unusual degree both to the audience and to the speakers. We have never heard a more interesting address than that which Mr. Francis H. Carr, C.B.E., the President of the Society of Chemical Industry, delivered last week. His subject was fascinating—it was "Insulin and its manufacture"—but the treatment was equally attractive. Mr. Carr unfolded the history of the utilisation of natural remedies produced within the body to supplement its activities, and showed how every discovery depends upon previous work, how every stage in the unfolding of knowledge prepares the way for some further advance. Our readers are familiar with the story of thyroxine, the active principle of the thyroid gland, how it was first isolated, how the process of preparation was improved and how, recently, Dr. Harrington accomplished its synthesis so that thyroxine has now become a product of the fine chemical manufacturer. As yet we have not advanced so far with insulin, but there is ample cause for satisfaction with the achievement of the British fine-chemical industry in so improving the manufacture of insulin that, within a year of its manufacture, the selling price could be so reduced that the cost of treatment, at first prohibitive to many, came within the reach of all. Mr. Carr adduced evidence which suggests that we are within almost measurable reach of a disclosure of the chemical identity of insulin. A great deal is known about the biochemistry of the body, but a great deal more is still unfortunately obscure. At present the line of progress seems to lie in the isolation, identification and subsequent synthesis of products produced by groups of cells of the body, but how much is known about the chemical activities of the vital unit, the living cell? How such a delicate problem is to be solved we confess we do not know, but we are certain that the extraction of other valuable constituents of the animal body will be quickly followed by their production on a large scale by the British fine-chemical manufacturer. We are privileged to print a short account of Mr. Carr's address in this issue, and shall

look forward to the pleasure of reading it in full when it appears in the Journal of the Royal Society of Arts.

The British Industries Fair

How varied and how interesting is the life of an editor! But for the work attached to the post it would be an ideal existence. One week you are invited to stay at Oxford and see "those regal dons, with hearts of gold and lungs of bronze, who shout and bang and roar and bawl the Absolute across the hall, or sail in amply billowing gown, enormous through the Sacred Town." A few days in this lofty and rarefied intellectual atmosphere brings you up to date in the philosophy of science, and thus fortified you may sit at the feet of the physiologists and biochemists who speak of vitamins, of irradiated ergosterols, of the functions of glycogen, of the benefits arising from stockings transparent to ultra-violet light, of oxidation of the blood and the proper use of the lungs. In our infancy we could scoff at their teaching with the carelessness of the ignorant: "when Duty whispered softly 'Breathe,' the youth would answer 'Blow,'" but long association with, and exposure to, the learned has got us into the habit of obedience. Then the editor meets manufacturers and those who bestow their wisdom in industry and he finds a rich field to enjoy and praise in such a monument as the British Industries Fair. The chemical exhibit justly occupies the premier and most important place. None can ignore it, none can pass by without admiring the artistic way in which chemical products are displayed and marvelling at their infinite variety. The casual visitor sees thorium and titanium compounds prepared from precious sand from southern climates brought, but even Dryden with all his prophetic sense did not see what could be prepared from monazite. There are heavy and fine chemicals of every colour, and crystalline form, perfumes which are at once a tribute to the skill of the chemist and to the extraordinary delicacy of the human nose as a piece of apparatus, drugs which will pleasantly convey the most essential vitamins to the most dainty palate, unguents and ointments which will restore the blush of youth to all those who are compelled to make up for lost time or to those others who wish to be in the fashion and say not with the Pharisee, that they thank God they are not as others are. There are fructoses and saccharins compared with whose

marvellous sweetness honey and manna are bitter to the taste. There are eloquent salesmen and courteous instructors and neat-handed Phyllises to offer you means of soothing the parched and torrid throat. You may wander for many hours finding always something to charm. It is, we mean the Fair, all very good.

The Indigo Industry of India

The indigo planting industry in India has lost its former very great importance since the discovery and introduction of synthetic indigotin, a substance prepared from coal-tar, and identical with the principal colouring matter obtained from the plant. This substitute has ousted the natural product to a very large extent in Europe and America, and, even in the East, the home of the indigo plant, the energetic representatives of the German colour manufacturers are found everywhere carrying on intensive propaganda for the synthetic dyestuff. During the past 30 years various attempts have been made by the Indian Government in collaboration with the planters to maintain the indigo industry by improved methods of cultivation and manufacture, but each improvement resulting in a reduced cost of production has been countered by a competitive reduction in the price of the synthetic product. For certain purposes natural indigo is preferred. The heavier and deeper shades of blue which it yields are due to the presence of certain subsidiary colouring matters and make it especially suitable for very deep navy-blues on wool, and for the peculiar tones esteemed in Persian carpets. Against this preference must be put the fact that synthetic indigotin is supplied in the form of a paste of absolutely constant composition, whereas the plant indigo in each individual chest may contain a different percentage of colouring matter, and this difference has to be taken into account in preparing the dye-vat. In recent years this difficulty has been overcome, and, as the result of work carried out by Prof. H. E. Armstrong and Mr. Reginald Brown, it has been made possible to supply natural indigo also in the form of a standard paste with good keeping qualities: given equal prices, there is no difficulty in finding a market for this paste. The chief problem, therefore, as far as sale in the British home market is concerned, is the production of natural indigo at a sufficiently low price. The manufacturers of synthetic indigotin have scored, however, a further advantage by placing it on the market in an alternative form which greatly simplifies the preparation of the dye-vat. This newer form of paste, known as "reduced indigo," "indigo solution" or "indigo vat," allows of the production of a perfectly clear dye-vat in a few minutes, whereas most vats made from the ordinary synthetic paste and all vats made from natural indigo contain more or less sediment which must be allowed some time to settle before the vat can be used for dyeing. The problem of making a readily and completely-soluble product of the kind mentioned from plant indigo, which shall retain all the other advantages of the natural indigo, is engaging the attention of workers in this field, but offers very considerable difficulties. It is hoped and expected that a market of some extent, even if limited in comparison with former days, may still be retained for natural indigo.

"Hg. 33"

Addressing the Royal Society of Tropical Medicine last autumn, Lord Balfour remarked that our predecessors maintained that man was the crown of creation, and although he did not deny it, he felt that man was having a very uphill fight against organisms which were not the crown of creation, and he was not sure that man was getting the best of it. That feeling is shared by all who know much about the struggle that is being perpetually waged against tropical diseases, but it is lightened by the thought that what chemotherapy has done before it can do again: malaria, yellow fever, and sleeping sickness are now well under control, then why not leprosy and similar scourges? Although much progress has been made in the treatment of leprosy by the use of the rhodium salts or ethyl esters of the characteristic acids of chaulmoogra and hydnocarpus oils, and particularly by improved methods of administering them, this malady is still rife. In the Indian census of 1921 no fewer than 102,513 cases of leprosy were recorded, and the number was probably much larger because, owing to ignorance of the early symptoms of the disease, together with fear of social ostracism and loss of employment, the native seeks to hide his affliction as long as possible. Thanks to the success which has attended modern methods of treating leprosy in its early stages, victims of it are beginning to realise that cure is at last possible, and they are offering themselves for treatment; and owing to this development medical men are making a more effective study of a far larger number of cases than they could before. One of the chief remaining difficulties, however, is to treat patients who are suffering simultaneously from leprosy and another disease, like hookworm, malaria, or syphilis, because a drug that alleviates or cures one disease may be very harmful to another. Thus, Dr. E. Muir, a recognised authority on tropical diseases in India, has stated that it is often dangerous to administer an arsenical drug like neo-salvarsan to a syphilitic leper, and a remedy is needed which will combine the oil-treatment of leprosy with a harmless anti-syphilitic treatment. Such a drug has been discovered by Dr. T. A. Henry, Director of the Wellcome Chemical Research Laboratories in London, and has been tested on a considerable scale by Dr. Muir in India since August, 1924. The drug is a mercury derivative of *m*-hydroxybenzaldehyde, which is dissolved in hydnocarpus or chaulmoogra oil, or in ethyl esters made from these oils. When injected with this potion, the patient undergoes treatment for the two diseases at the same time. A preliminary account of Dr. Muir's results is published in the last issue of the Indian Journal for Medical Research. The compound he used was "Hg. 33," or 2-myristoxymercuri-3-hydroxybenzaldehyde [$C_{20}H_{33}(CHO)(OH)(HgO.CO.C_{13}H_{27})$], and he found that practically all his patients improved under the treatment: the Wassermann reaction (the usual diagnostic test for syphilis) became negative in a majority of the cases, whilst the concurrent leprosy was alleviated in all. Moreover, the new drug gave rise to none of those undesirable effects which so frequently accompany chemotherapeutic treatment. We congratulate Dr. Henry on the success of his long research, which, we understand, he is still pursuing.

INSULIN AND ITS MANUFACTURE

Dr. H. H. Dale, C.B.E., F.R.S., presided over the meeting on February 23, when Mr. Francis H. Carr, C.B.E., F.I.C., the President of the Society of Chemical Industry, gave an address on "Insulin and its manufacture" before a large and representative audience.

Mr. Carr said that long before the discovery of insulin the pancreas was regarded as the source of a substance which controls the amount of sugar in the blood stream, but in 1922, Banting and Best were the first to isolate from the pancreas a substance—insulin—which had this property in a marked degree. Their method of investigation was to inject extracts of pancreas into living animals and to determine the effect upon the sugar content of the blood. For this they required to use living animals, for insulin does not produce its effects in blood which has been removed from an animal. They required, too, delicate methods of determining minute amounts of sugar in blood. These had been recently evolved by biochemists, and the work of Banting and Best was in no small measure dependent upon these delicate methods of analysis which others had elaborated before them.

Now the pancreas had another function, namely, that of secreting digestive enzymes, including a proteolytic ferment, trypsin. This ferment passes down a duct into the alimentary canal. Insulin, on the other hand, does not pass down this duct, but finds its way from the pancreas to the blood stream internally. It was unlucky that insulin and these digestive secretions should occur in close proximity in the pancreas, because the chemical nature of insulin is such that it is rapidly destroyed by these digestive substances. It was mainly due to this fact that previous investigators had failed to isolate insulin; this was the difficulty which Banting and Best overcame.

It had been shown that the foetal pancreas does not, up to the fourth month of development, secrete trypsin, and Banting and Best found that an extract of foetal pancreas, though free from trypsin, had a powerful effect in reducing the blood sugar. This gave them the clue, and they set out to devise methods of extracting the pancreas which would give an extract rich in insulin and poor in trypsinogen. As trypsinogen is insoluble in 95% alcohol, they employed this solvent, and finally arrived at a method of preparing a very active extract.

Mr. Carr then summarised the properties of insulin, and said that the most characteristic property which is used for separating it from accompanying impurities is precipitation by adjusting the acidity of the solution exactly to p_H 5, the iso-electric point. By precipitating with absolute alcohol and then re-precipitating from dilute solution with picric acid and, finally, taking advantage of this iso-electric precipitation, repeating the process, if necessary, a white powder may be obtained which has an activity such that a unit is represented by 0.5 mg. Abel had, however, carried the purification further by precipitating with pyridine from acetic acid solution, and he claimed to have produced a substance of which 0.01 mg. represents a unit. Others claimed to have produced insulin which gives negative reactions for tryptophane and tyrosine. Casimir Funk claimed to have

prepared a substance of constant composition to which he assigns the formula $C_{86}H_{102}O_{22}N_{18}S$. He considered that it is a polypeptide in which fifteen amino acids are coupled. Abel found that with increasing purification there was an increase in the sulphur content of insulin, and he believed that that portion of the sulphur which is easily split off is an index of the physiologically active hormone present in impure insulin. Abel thought that sulphur is an integral constituent of the molecule. One well-known amino acid of the body, cystine, a substance readily obtained from hair or wool, contained sulphur. Would the insulin molecule be found to possess similar grouping?

Under normal conditions the body produces insulin in the pancreas and stores it, and there is continually discharged into the blood stream that amount of insulin which maintains the blood sugar at the usual level. By some wonderful adjustment the supply of insulin is increased when the blood sugar rises above and cut off when it falls below normal. In a person suffering from diabetes the supply of insulin fails, either from lack of insulin or from a defect in this process of releasing it.

Within the past year it had been shown what happens to the sugar when it disappears from the blood under the influence of insulin. The sugar was not entirely used up, since the increase in the amount of carbon dioxide given off by the body or of oxygen taken up by it was not sufficient to account for all the sugar which disappears. Best, Dale, Hoet, and Marks had shown in a fine piece of work, that the loss of sugar was completely accounted for by conversion into glycogen and by combustion.

The main part played by insulin was, therefore, to promote the storage of sugar in the form of glycogen and also its oxidation of sugar. In normal metabolism some sugar is formed in the liver, from protein and possibly from fat. Dale and his colleagues had shown that insulin depresses this formation in the liver of glucose from protein and fat. In the diabetic, and probably also in the normal individual, sugar was produced from fat, but in the diabetic certain abnormal products of fat metabolism were formed, namely aceto-acetic acid and acetone, and these were excreted in the urine. There was frequently also present what is obviously the parent substance of these two compounds, namely, hydroxy-butyric acid. These substances resulted from the oxidation of fats. Not only, therefore, was a diabetic unable properly to dispose of carbohydrate, but the fat was not oxidised to the normal end-products CO_2 and H_2O . Insulin treatment caused the rapid disappearance of aceto-acetic acid as well as of sugar from the urine. It seemed likely that insulin acted primarily on the sugar metabolism, and that fat metabolism could not proceed normally without simultaneous occurrence of the former process, but we had to await the final elucidation of this and a host of other problems of a similar nature. The discovery of insulin had given a new and very valuable method of investigating body metabolism, opening out a vast field for research.

While insulin was necessary to prevent the accumulation of sugar in the blood beyond the point at which the sugar, so to speak, becomes harmful to

the body, and interferes with the cell processes, on the other hand, too much insulin reduces the sugar to a minimum figure and acts as a poison, causing severe symptoms and ultimate death. There was, moreover, stored in the pancreas of a normal person insulin much more than sufficient to cause death were it all released at the same moment.

An account was then given of the determination and standardisation of insulin, and in the course of a detailed description of the manufacture the method of preparation was outlined as follows: (1) The pancreas glands were procured, dissected and cooled as rapidly as possible after the death of the animal. (2) Grinding and mincing at a low temperature was employed to break up the cells very thoroughly. (3) The material was made acid to pH 2.5 or alkaline to pH 7.0 in order to set free the insulin from the tissue on which it is adsorbed. (4) It was then extracted with alcohol of such a strength that but little of the enzyme is dissolved, and as much as possible of the insulin. For this purpose alcohol of 65-70% had so far proved the best solvent. (5) This extract was clarified by cooking it to 5° and filtering or centrifuging it. (6) After concentrating at a low temperature to one-tenth of its volume, the fat was extracted, followed by filtration. (7) The proteins were precipitated with ammonium sulphate or with absolute alcohol at pH 5. (8) The protein mixture was precipitated by adjusting the aqueous solution to pH 5.2. Proteins which were precipitated above and below pH 5.2 did not merely dilute insulin, but were antagonistic to its action. This purification was consequently of great importance. (9) Finally came formation of the picrate and regeneration as a hydrochloride by Dudley's method. By this means alone 90% of the inactive protein could be removed from some samples of crude insulin, since, although insulin when pure may be almost completely precipitated at its iso-electric point, the presence of accompanying proteins tended to keep it in solution even at this point.

• The large-scale manufacture had been installed as a continuous process which was illustrated with a comprehensive flow sheet. The plant had been so arranged as to ensure rapid handling, continuous recovery and strengthening of alcohol, automatic control of temperature, and so forth. When first this manufacture was commenced the yields obtained were very low, though quite as high as those obtained in other laboratories, being but 50 units per kg. of pancreas. There was also, at first, a great loss of alcohol. As our knowledge had extended and the plant had been perfected, it had been possible to increase the yield twenty-fold, and to reduce the loss of alcohol to a very low figure. So great progress could not have been made without the assistance given by communications from many workers in the field, both in this country and in America and Denmark. In particular, mention must be made of the invaluable help given by the National Institute of Medical Research. As the result, the selling price of insulin was reduced by successive stages from 25s. to 2s. 8d. per bottle of ten doses within the first year of its manufacture, thus bringing the cost of treatment, at first prohibitive to many, within the reach of all. At the same time the purity of the insulin had been greatly improved.

The clinical use of insulin was then discussed, and it was shown how, with the skilful regulation of diet with insulin administration, a comparatively normal blood sugar could be maintained. Abundant evidence was at hand to show the wonderful results achieved by the treatment, and two remarkable and dramatic cases were shown on the screen. Very severe diabetics were likely to die in a state of coma. The onset of these symptoms had, until recently, been regarded as proof that death was at hand. With insulin treatment recovery from the comatose condition was not only likely but probable; numerous cases were on record of people who had thus been snatched from the jaws of death.

The discovery of insulin had been the starting point of many researches. Although insulin was discovered in Canada, much of the work referred to had been contributed from other countries: in particular from the United States, from Denmark, from Japan, and from this country: and quite recently the news had come from Germany that Frank, Nothmann and Wagner, colleagues of Minkowski, who contributed greatly to our early knowledge of the physiology of the pancreas, had discovered a chemical substance—a derivative of guanidine—which produced effects similar to, although much less intense than, those of insulin. A Japanese investigator, Watanabe, showed that guanidine reduces blood sugar, but was too toxic for use in the treatment of diabetes. Another guanidine derivative, which was said to exercise in diabetic patients the same effects as insulin, but produced them much more slowly, had the advantage that it would be administered by the mouth. Perhaps its greatest interest was that it may prove a step in a direction which by leading chemists and pharmacologists to study other derivatives of this nature will enable them to find a true substitute for insulin.

In whatever state of purity, insulin seemed always to give, in common with proteoses, the biuret action, which implies that it is a derivative of $NH_2 \cdot CO \cdot NH \cdot CO \cdot NH_2$. Guanidine is $HNC \equiv (NH_2)_2$, agmatine is $NH_2C \equiv NH \cdot NH(CH_2)_4NH_2$, while synthalin is stated to be a guanidine derivative with a longer chain of CH_2 groups. The elucidation of the chemical nature of insulin itself is the step to be most profoundly desired. It might be that this would involve the destruction of as much as £1000 worth of insulin, but the priceless contribution to human happiness which the discovery of insulin represented made even that expense appear to be but a grain of sand on the sea shore. Once we understand the chemical nature of insulin, it is not too much to expect that the history of adrenalin and thyroxine will be repeated, and insulin, like the two latter, will be manufactured artificially.

In opening the discussion Dr. H. H. Dale paid a warm tribute to the skill of the British fine chemical manufacturer in developing the large-scale production of so delicate a product to such a high pitch of efficiency within a very short period. An interesting discussion followed, many points being raised. Mr. C. A. Hill quoted testimony to the excellence of British insulin and other fine chemical products, which showed that they were being appreciated to a gratifying extent abroad, and various speakers dealt with the clinical use of insulin.

A MESSAGE FROM OLD LEIPZIG THROUGH LONDON (TO GERMANY)*

By Prof. HENRY E. ARMSTRONG, Ph.D. Leip. 1870

The *Chemiker Zeitung* has been a faithful record of chemical activity in the past fifty years—a period during which progress has been continuous. As I can also look back upon the ten years prior to the establishment of the journal, probably there are few who can better appreciate the influences that have been at work and the vast development of the usefulness of chemistry that has been effected. Perhaps its growth has been almost too rapid. Chemists, to-day, seem to be too little aware of the greatness of the burden that is now cast upon them; they are probably insufficiently alive to the opportunities and the difficulties that lie before them. If Liebig could say to Kekulé: "If you will be a chemist, you must ruin your health. No one who does not ruin his health by study comes to anything to-day in chemistry"—what must be the position to-day? Use has been made of our science mainly on the industrial side and in sanitary affairs: thus far, no success has attended our efforts to spread its influence among the masses, to give it intellectual and moral value. Chemists, hitherto, have been mostly artificers; artists have been rare among them and philosophers still rarer. There is danger that our science may be made too materialistic in its outlook: especially is this true of the United States.

I began the study of chemistry in 1865, under Hofmann shortly before he left England. I was sufficiently in contact with him to be influenced by his magnetic personality and fortunately, in after years, had the opportunity of meeting him often enough to appreciate the greatness of his character. If he did not lay the foundations of chemical study in London, he was undoubtedly the first to establish a school of devoted and enthusiastic workers. The qualities he developed were at the root of the wonderful influence he afterwards exercised in Germany. A courtier and diplomatist of the first rank, gifted with great literary skill, he not only did much to encourage technical advance but also exercised a commanding social influence. Chemistry to-day is more in need of men of his type, of high social ability, than of mere technical experts. Chemists are growing up a race apart, with little influence upon intellectual thought and public opinion. Scientific occupation is apt to narrow, if not to sterilise mental outlook. It is on this account that we need to ponder the characters of men of genius of the Davy, Faraday, von Humboldt, Liebig, Dumas, Hofmann, Helmholtz, Pasteur, Cannizzaro type—all men of universal mind. Such men are born, not made; still, we might do more to encourage their development. We are not sufficiently alive to the dangers which the growth of present-day specialism brings in its train. We are fast becoming less and less able to solve the great problems of life, because these involve a breadth of treatment which none attempts to cultivate. In fact, we have too long worshipped the specialist and greatly overrated his importance.

My first English teacher, the celebrated Frankland, was associated with Kolbe, in London, before going with him to Marburg, to study under Bunsen. They were fellow workers in the laboratory of Dr. Lyon Playfair and there began their joint work on the nitriles (1847-48). Frankland's great discovery of zinc ethyl was made in Bunsen's laboratory in 1849. I assisted Frankland in devising the method of determining organic matter in drinking water, involving combustion of the residue *in vacuo*, with the aid of the Sprengel mercury pump. With the aid of this method, Frankland made a complete survey of our English water supply, and brought home to the public the fact that contamination by sewage matter was the one great source of danger. Frankland should rank with Lister and Pasteur as a saviour of the world's health.

This work finished, at Frankland's recommendation, I went to Germany in the autumn of 1868, naturally to his friend Kolbe, who was then professor in Leipzig. I remained with him until the spring of 1870. Those were days when German chemistry was a "selbständige Wissenschaft," uncontrolled by industry. We were a very happy family, most of us trying to work out small ideas of our own, not themes suggested by the professor. The desire we had was to learn to work independently and make ourselves chemists—to do something creditable and, therefore, to finish our work. We gained a wide experience.

Kolbe was a very remarkable man—a Puritan and a hater of pretence. Full justice has never been done to his memory and character nor to the service he rendered to German chemistry. To-day, probably, few will understand his writings. He necessarily made himself unpopular by the sharpness of his criticisms but he was essentially right. His protests against slovenly writing in the *Berichte* were thoroughly justified and the cause of no little improvement. Himself, he wrote a German perfect in its clearness and directness. We gained much from his example.†

Changes were taking place, however, with which he could not sympathise, even if he understood them. At that time a new era in organic chemistry was setting in. The dawn of a fully developed structural chemistry was just breaking: logical application was being made of the principles of valency propounded by Frankland and by Kekulé. We were trying to develop the position—chemistry of benzene; in fact, the task Kolbe set me, on arrival, was to study (*ortho*)phenolsulphonic acid. I first worked in the old laboratory. Gräbe, who was then Privat Dozent, had a bench near to mine. I well remember his going to England to meet Perkin and others over the Alizarin patent. Hüfner was among the workers, also Ludwig Darmstaedter. I was present (1868) at the birth of urea from ammonium carbamate and witnessed its delivery by Basarow. *Iso-Succinic acid*, the first dicarboxylic acid with two carboxyl groups attached to one carbon atom, was also born at

† That the present generation cannot enter into the spirit of the happenings of those days, and can no longer form a just estimate of the character of those they have never known, is clear from the absurd account of the Kolbe-van't Hoff episode published in this JOURNAL at the time of the recent Leiden-van't Hoff celebrations. Kolbe was one of the most genial of men, a fine example of German *Gediegenheit*. I saw him now, as one asked his opinion of a projected experiment. Pulling at the lapels of his coat with his two hands and smiling, he would even answer:—*Versuchen Sie es! Try it! Herr A.*

* Written, at the request of the Editor, for the Jubilee number of the *Chemiker Zeitung*. Despatched 23.11.26. Published in German 12.2.27.

this time. In the new laboratory, my bench companion and great friend was, Liebig's nephew, Karl Knapp, a *Prachtkerl*. Sad to say, he soon fell a victim to tuberculosis. Although I never saw Liebig, to have been so nearly in touch with him, in this way, was more than interesting, especially as I had the privilege, on one occasion, of spending several days, during the vacation, in Knapp's parents' home in Braunschweig and thus was able to appreciate his mother's charm. Heinrich Fresenius was another special friend.

One dabbled in all sorts of subjects besides chemistry. Agricultural chemistry (Knop), botany (Schenk), mineralogy (Naumann), physics (Hanckel), physiology (Ludwig) and even anatomy. I attended Ludwig's complete course of lectures. The anatomy class we attended was a special one Knapp managed to arrange for on Sunday mornings, by Professor Braun, then in repute on account of the sections he was making through frozen cadavers. In London, as a student, I had frequently witnessed, on Saturdays, the surgical operations in the theatre at one of our great hospitals. We also attended the *Gewandhaus*, which provided priceless chamber-music, the theatre and the *Kneipe*, the last, in those days, one of the greatest of German institutions, where much of the real work of understanding was done. Those were indeed happy times. I mention these things to show what some of us managed to include in chemistry in those days. We did this too without any obligation and in no way as preparatory to an examination—apart from the prescribed qualifying courses of lectures we attended on the two subjects we were called upon to select outside our own special subject. Judged by results, I think that those of us who grew up under such a system compare not unfavourably with the modern ever- and over-examined product, studying only subjects that will pay.

I had met Peter Griess when I was a student in London, as my chief friend, Horace Brown, came from Burton-on-Trent and I often visited him. Griess had then but recently taken the place at Allsop's Brewery of Dr. Böttlinger, father of the H. von Böttlinger, who played so leading a part in the Baeyer firm at Elberfeld. After my return from Germany, I soon became intimate with Griess and through him with Heinrich Caro, who gained much inspiration of the greatest importance to the Azo-farben industry from his visits to Griess. I learnt to know Lunge and was on terms of intimacy with Otto Witt during the time that he was engaged in producing the Tropæolins at Williams, Thomas & Dower's factory near London.

In 1875 I became associated with W. H. Perkin. We were fellow secretaries of the Chemical Society. He was then still a manufacturer and engaged in studying the hydroxyanthraquinones. I took part in one of the earliest of the great chemical patent law suits, the salicylic acid case, von Heyden v. Neustadt, in 1879. I had made salicylic acid from carbon dioxide and phenol, by Kolbe's original process, when at Leipzig. Later on, I was in the celebrated Fast-red case, *Badische v. Levinstein*. I was also in the Aspirin case, appearing against the Baeyer firm. I mention these facts to show that I was long in close touch with the dyestuff industry in Germany. Attending, as I frequently did in early

years, the *Naturforscherversammlung*, I learnt to know all the leading workers. I first met Emil Fischer in 1883, the year in which I made a tour of nearly all the German laboratories.

What I have said thus far will have shown that I was largely "made in Germany." I therefore may venture upon an opinion of the present as compared with the past condition of affairs chemical. In the application of chemistry to industry, progress has been extraordinary; on the academic side. I incline to think that there has been a definite retrogression in outlook. The range of the subject has been so widened that it has lost the compactness and philosophic precision it had in early days: in some respects it is lacking in "moral" and certainly far too speculative. As in religion, we are broken up into too many churches.

Two transforming influences have been at work: one commercial, the other academic in its origin. Neither Perkin's prime discovery of Mauve in 1856, nor the later work (1869) of Graebe and Liebermann on Alizarin, had any notable effect upon academic workers: dyestuffs were not yet in the public eye. A great change in the academic outlook was produced by Kolbe's discovery (1874) of an easy method of producing salicylic acid from phenol, using caustic soda instead of sodium and operating under pressure. Chemists became suddenly aware of their value and of the opportunities open to them. They recognised that industrial methods could be developed in the laboratory. The further discovery of the great medicinal value of salicylates gave additional importance to the discovery. Soon every chemist of promise was retained by this or that firm and his services were subsidised. Suddenly, the members of the junior staff in University laboratories became selfish workers—each had his little band of embryo *Doctoren* working under him, all of whom were pledged to secrecy. Laboratories ceased to be units and were broken up into close coteries. From that moment the *Lern* and *Lehrfreiheit* of the past were no more. Academic chemistry was commercialised. As a consequence, the German laboratory lost much of the value it had as a training school in my time when everything that was going on was freely discussed. It has often been said that no man can serve two masters.

The centre of gravity thus became shifted from the University to the Works Laboratory, the more as time went on and industry prospered. The works laboratories have now long been the real centres of progress, where work has been carried out not only with scientific precision but with true logical purpose, zeal and method. German chemical industry has set a great example, both to scientific workers and to the commercial world generally.

Apart from the work done by a few, especially by a giant like Emil Fischer, whose example no one has properly followed, most academic study has been spasmodic and sporadic in character and weak in purpose. In fields unexploited in industry, our knowledge is still scrappy and indeterminate. The fields cultivated by industry have been filled in and rounded off with marvellous completeness.

The value of University study has been further lowered by the intrusion of an influence definitely adverse

from the work of the chemist—that of mathematics, the more as a type of mind has been thereby introduced into the profession to which chemistry proper makes no appeal. This is not to say that mathematics is not of value in our subject when properly applied, nor that the chemist should be without mathematical training.

Chemistry is not merely a science but an art and mainly a constructive art. The chemist is of little value unless he can make something and have full sympathy with the characters of the materials he handles; he must have both fingers and feeling (*Gefühl*). During the past forty years, a new school, the physical school, has been brought into existence which has neither fingers nor feeling. As I once heard friend Duisberg say: *Die Schule hat keine Methode!* Six months spent in determining electrical conductivity is no training in chemistry and this is true of most physical exercises. No Doctor's degree in chemistry should ever have been given upon such work. In so far as it is necessary—and that it has its value in its proper place is beyond question—the work should be incidental or post graduate. Again, in no field has premature specialisation done more harm than that of so-called Biochemistry. The main cause of the slow increase in our understanding of vital phenomena is the incomplete chemical equipment of a majority of the workers and the almost complete ignorance of chemistry of medical men. In chemistry, more perhaps than in any other branch of scientific work, we need to get back, as far as possible, to a single subject: to make the training as thorough and complete as possible before allowing specialisation. The chemist is now as necessary to the community as is the medical man and as much care should be taken in training him.

In another way, harm has been done of an even more serious character than that caused by premature specialisation—of the character foreseen by Kolbe in his criticism of van't Hoff. A distinct metaphysical element has been introduced into our teaching. The rigid logic of experiment has been put aside and dogmatic methods of treatment adopted in its place. Thus, the Arrhenius speculation has been elevated into a pure religion by Ostwald and his school and they have avoided and resented all discussion of its validity. The effect has been that several generations of students have grown up without training in logical argument and consequently without judgment or critical power, with no proper respect for proved fact. Progress in science necessarily involves questioning every conclusion arrived at, not once but repeatedly, as new evidence is produced; the habit seems to be nowhere cultivated. I several times talked the matter over with Emil Fischer, who was fully alive to the danger. He was too good natured, however, and had not the courage to incur the odium involved in protesting against the decay that was setting in, destroying the old art of experimenting.

We need to get rid of the practice which now has so long prevailed of worshipping authority, especially when so-called "theory" is in question. Too often those who have been ranked as authorities have been men who patently are not to be regarded as chemists in any real sense of the term—such as van't Hoff, Arrhenius, Ostwald and Nernst.

We need to turn more to facts and to analyse them.

The disregard of almost everything fundamental underlying the problems of chemical change in the text-books of to-day is astounding and most pitiable. There is no authenticated science of chemistry to be found in them. We are little further in these matters than we were forty or fifty years ago. Scarcely a chemist has a clear conception of the actual process in this or that change which he can defend by any force of argument based upon fact. The first principles are scarcely established. In other words, we are disgracefully behind in our treatment of theory. Probably also not a little of our accepted theory may be wrong.

To take the special case of carbon. Frankland proposed his general theory of valency in 1853. Kekulé, a little later, dealt specially with that of carbon and outlined the tetrahedron conception, already foreshadowed by Pasteur, which was more fully developed and made popular by van't Hoff in 1875. Van't Hoff's lead has been followed to the present day. The proposal he made was to represent the carbon atom by a regular tetrahedron and to assume that the four valencies were directed from the centre of mass, one to each of the four apices. He joined tetrahedra at their apices to represent carbon atoms united by single affinities. The use he made of the hypothesis in explaining optical activity, already implicit in Pasteur's discovery, was so satisfactory and gave rise to so many opportunities for work that it was accepted without discussion or question and extended. Chemists had acquired the habit of talking about the benzene ring and so soon began to think of rings built of fewer atoms than benzene—the polymethylenes. Baeyer developed his strain hypothesis, explaining the variations in unsaturation in such supposed rings on the assumption that the more the angle at which the carbon atoms meet in the ring departs from the angle between the valencies in the tetrahedral atom (109.3°) the greater is the strain. The ring is figured as a loose structure and no hesitation is felt in filling atoms into or bridging the ring—as in camphor, for example.

To-day, at last, we are beginning to think in terms of solid structure, not merely of isolated molecules, and to discern the arrangement of atoms in the molecules in crystals. Van't Hoff, strange to say, seems never to have thought in terms of solid geometry, although he made use of a solid geometrical model but only to deduce a certain superficial geometrical consequence.

To arrive at conceptions of solid structure it is only necessary to use the model geometrically—to think of the four affinities in the carbon atom as emerging each at the centre of a face of the tetrahedron. The paraffinoid form of union is then represented by joining tetrahedra *face to face*.

In attempting to correlate structure with crystalline form, Barlow and Pope have represented valency in terms of volume. Regarding hydrogen as having unit volume, they assume that oxygen, nitrogen and carbon occupy respectively twice, thrice and four times this unit volume. Acting on this view, Mr. Barlow and I have constructed models, using a single sphere to represent hydrogen and two, three and four spheres to represent oxygen, nitrogen and carbon. The model of the carbon atom thus becomes a regular pyramid of

four-unit spheres, corresponding to the van't Hoff tetrahedron. Such pyramids closely packed together endlessly, alternately base downwards and base upwards, form a model which is in accordance with Sir Wm. Bragg's analysis of the diamond. Six such tetrahedral pyramids can be so arranged, to form a *closed system*; if six unit hydrogen spheres be arranged symmetrically around the periphery of the system, three in a lower and three in an upper plane, a model is obtained which may be regarded as that of benzene. No less a number of tetrahedral units than six can be so arranged to form a closed system. If the model of carbon used be in any way an approximation to fact, it follows that many of the supposed ring systems are non-existent.* It is at least necessary, therefore, to re-examine the evidence upon which a large number of structural formulae—particularly of compounds of the terpene class—have been constructed.

It may be heresy to so question conclusions that are now confidently accepted, but to make full logical use of the tetrahedral hypothesis—to use solid models and pack them closely, on the assumption that the atoms themselves practically fill space—is at least as legitimate a use as that made of it by van't Hoff.

To conclude, looking back, as I do, over sixty years of herculean practical achievement, it is impossible not to be greatly struck by the marvellous constructive and analytic genius displayed by workers in the laboratory: equally, not to be surprised at our comparative failure, in the study, to utilise the wealth of material so accumulated. It is clear that we need to develop the mental powers of the rising generation more fully and more soundly than in the past, to enable it to cope with theory in a satisfactory manner.

Germany to-day can congratulate herself on the steadfast purpose and success with which, during the past fifty years, science—especially chemistry and engineering—has been applied to industry. If she wish to retain her position, she will needs strengthen her academic system, so that the training in chemistry may once more be made serious and thorough, honest and logical, not speculative and superficial.

Chemistry is the business of handling and knowing the materials the earth provides: yet the extent to which such materials are considered to-day in academic study is "verschwindend klein"; they count for little in examinations.

Such is the message I would fain bring in pious memory of my revered master Kolbe.

Having arrived at so awkward a conclusion I have necessarily been led to study the problem, and have found that a second mode of union distinct from that ordinarily postulated between carbon atoms, which admits of close packing, is possible. I referred to this in my recent Horace Brown Memorial Lecture.

SODIUM PEROXIDE IN NORWAY

Sodium peroxide has been manufactured in Norway by two firms, the Fredrikstad Elektrokemiske Fabriker A.S., of Fredrikstad, and the Vadheim Elektrokemiske Fabriker, A.S., of Bergen. According to the U.S. Trade Commissioner, both companies have discontinued the manufacture of sodium peroxide, which is not being produced in Norway at present.

VALENCY TERMINOLOGY

By J. D. MAIN SMITH, Ph.D., B.Sc.

The charge is often levied against chemistry that it makes use of a mysterious and incomprehensible language, and the layman, unconvinced of the necessity for this strange lingo, has not hesitated to stigmatise it as sheer jargon. In general, the charge is unjustified, for chemistry deals with facts and ideas for which the words of living and dead languages offer an insufficient description. In order to give definiteness and intelligibility to these technical facts and ideas, it has been necessary to devise new words which are outside the common ken. It is the usual scientific practice to coin new words from the dead languages, Latin and Greek, by impressing on the old words a scientific meaning having some connection with or relevance to the original meaning. It is further customary to inflect the root word with prefixes and suffixes from the same language.

The mathematical sciences prefer words adopted or adapted from Greek, the language of a race of theorists, whereas the experimental sciences prefer Latin, the language of the more practical Romans. As chemistry is rooted in alchemy, for which Latin was the invariable medium, chemical terminology is almost exclusively Latin in origin.

Occasional hybrid words, having roots in one and inflections in another language, have crept into chemical nomenclature. Such hybrids, however, are generally admitted to be etymological monstrosities, and their use is sanctioned only by a consensus of chemical opinion, based on appreciation of very definite advantages offered by such hybrids over alternatives of purer origin.

The plea of guilty to the charge of jargon must be entered where hybrids are used indiscriminately or without obvious advantages, where inapt and repellant words are used when simpler and more euphonious words are available, or where a technical word is coined redundantly or in application to several different conceptions. That odd and unnecessary hybrids, and words repellant, clumsy, unpronounceable, defective, and indeterminate in meaning, are among the current coin of chemical nomenclature cannot be denied, and the time appears ripe for purification and simplification.

Perhaps no word is the subject of more confusion in chemical terminology than *valency*. There is no general agreement even as to the definition of the term. Probably the definition most free from ambiguity and most generally accepted is that valency is a number expressing into how many equal parts, each chemically *equivalent* to a hydrogen atom, an atomic weight is divisible. Whatever definition of valency be proposed, it must embody the idea of multiplicity of units each *equivalent* in combining capacity to a hydrogen atom. The word valency in fact is merely Wicelhaus's shorthand form for *equivalency*, suggested by Hofmann in 1865. The idea underlying equivalency had, however, been grasped nearly a century prior to the formal conception of valency, as is evident from the work of Cavendish and Richter on the equivalency of metals and bases in their power of neutralising acids.

Though equivalency and equivalent do not appear to have had any precisely equivalent forms in Latin, they

are definitely of pure Latin origin, being derived from *aeque* = *equally* and *valens* (*valentis*) = *strong, efficacious or available*. It is well known that in Latin, as well as Greek, the letter *e* was pronounced *ei*, and was usually indistinguishable from the sound of *i*. So near in sound were *e* and *i*, that these letters were indifferently written by authoritative Latin writers, as in *here* and *heri*, *legans* and *eligans*, *sibe* and *sibi*, *quase* and *quasi*. The Romans, in fact, in the three like cases of the plural of the third declension, wrote many, if not all, words indifferently in *es*, *is*, and *eis*, as in *partes*, *partus*, and *partes*; and in the accusative and ablative singular of the same declension, these terminations were indifferently used in innumerable cases. Hence, it came about, in the formation of English words compounded from Latin, that the Latin *e* was transcribed as *i*, as in *equivalent* from *aeque*. From this interchangeability arises the Latin variants for three, *tres*, *tria*, *trium*, *tris*, *trini*, and *terni*, and the prefixes *ter*, *tre* and *tri*.

Whatever prefixes are used for valency and valent, strict etymology requires that they shall be of Latin origin. There can be no excuse for the use of Greek prefixes, the consistent application of which would involve discarding the original word equivalent. At the present day, however, we find that Latin and Greek prefixes to valent and valency are used without the slightest pretence to consistency or uniformity. Not only does confusion exist as between consistent Latin or Greek prefixes, but Latin is used for some prefixes and Greek for others.

Even among writers who confine themselves to Latin prefixes, there is no semblance of uniformity of usage, as for example in *tervalent* and *trivalent*. Moreover, as *tri* and *octa* are prefixes common to both Latin and Greek, the words *trivalent* and *octavalent* are either Greek-Latin hybrids or pure Latin according to whether the writer habitually uses Greek or Latin prefixes.

The confusion is not lessened by the fact that the Greek terms *monad*, *dyad* and its incorrect variant *diad*, *triad*, *tetrad*, etc., suggested by Odling in 1861, are still in occasional use. Hofmann's *equivalency* and *quantivalency*, which are synonymous with *valency*, are also still in occasional use by the older generation of writers in chemistry.

In my book "Chemistry and Atomic Structure," and elsewhere, I called attention in 1924 to the confusion centering round the word *valency*, and suggested the consistent use of the Latin prefixes, *uni*, *bi*, *tri*, *quadri*, *quinque*, *sexa*, *septa*, *octa*, *equi*, and *multi*. The use of these prefixes can be fully justified by reference to analogous Latin and English words. These prefixes, however etymologically good, do not form a consistent series, the terminal letter of the prefix varying from *i* to *e* and *a*, six out of the ten prefixes ending with *i*. The other four prefixes have the variant good Latin forms *quinqui*, *sexi*, *septi*, and *octi*. Moreover, the sole Latin words for "five times," "six times," "seven times," "eight times," and "many times," are *quinques*, *sexies*, *septies*, *octies*, and *multi*, all of which have the same general form, the letter *i* following the roots of the words. This may be taken as good authority for the use of the *i* termination for the prefixes *quinqui*, *sexi*, *septi*, *octi*, and *multi*. If these forms are accepted the

whole of the ten prefixes for valency and valent fall into a series with the invariable *i* termination, in which uniformity and good Latin are maintained. The series offers in addition the immense advantage that it is easily memorised.

An examination of the Latin and English languages reveals the fact that the prefixes *uni*, *bi*, *tri*, *quadri*, and *aqui* (or *equi*), predominate greatly over all other variants.

In order of frequency of occurrence in Latin, the prefixes for *one* are *uni* (20), *un* (11), and *unu* (2), the bracketed numbers being the respective occurrences. *Uni* is the sole Latin prefix which can precede *v*, as in *universus*. In English, the order is *uni* (73), and *un* (6); and *uni* is the sole prefix that can precede *v*, as in *univulvar*, a word in which the first three letters (*val*) of the root are the same as in *valency*.

The Latin prefixes for *two* are *bi* (65), *du* (21), *duo* (17), *bis* (2), and *dua* (1), and *bi* is the sole prefix that can precede *v*, as in *bivertex*. In English, the order is *bi* (97), *du* (10), *duo* (8), *dua* and *bis* (6 each), and *bi* is the sole prefix that can precede *v*, as in *bivulve*.

The Latin prefixes for *three* are *tri* (118), *tertia* (7), *tre* and *ter* (6 each), *tertiu* (3), *terni* (2), and *terna*, *ternu*, *tres*, and *tris* (1 each). Of these only *tri*, *ter*, and *tres* are known to precede *v*, *tri* in five common words such as *trivium*, *ter* in one rare word *tervenificus*, and *tres* in the word *tresviri*, an obsolete form of *triumviri*. In English, the order is *tri* (141, excluding over 100 Greek words), *tre* (12), *ter*, *tertia*, and *terna* (4 each), *tern* and *terni* (1 each); of these, *tri* is the sole prefix that can precede *v*, as in *trivulve* and ten other words.

The Latin prefixes for *four* are *quadri* (37), *quadra* (17), *quadru* (12), *quarta* (7), *quater* (6), *quatuor* (5), *quartu* (3), *quadro* (2), *quatri* (2), *quarti* and *quarto* (1 each), and of these *quadri* is the sole prefix known to precede *v*, as in *quadrivium*. In English, the order is *quadri* (26), *quadra* (12), *quadru* (8), *quadr* and *quarter* (6 each), *quater* (5), *quarte*, *quad*, *quator*, and *quadro* (2 each), and *quart*, *quarta*, *quarti*, *quarto*, *quatra*, and *quatre* (1 each). Of these *quadri* is the sole prefix known to precede *v*, as in *quadrivulve* and four other words.

The Latin prefixes for *equal* (excluding *par*, which has the meanings of equal and opposite) are *aqui* (10), *aqua* (7), *aquo* (1), *aquabili* and *aquali* (3 each), *aquu* (2), and *aeque* (1). No case is known of any of these prefixes preceding *v*. In Latin, however, the mute consonants *v* and *p* are interchangeable, as in *ovis* (*opilio*), and *vervex* (*verpus*), and *aqui* is the sole prefix known to precede *p*, as in *aquipondium* and other words. In English, no precedent is needed, for *equivalent* is already established in common use.

The vast preponderance of the prefixes *uni*, *bi*, *tri*, and *quadri*, over all other variants in both Latin and English, renders it difficult to appreciate on what grounds the prefix *ter*, for example, has been approved, particularly in official publications. In Latin the word *ter* signifies thrice or three times, just as *semel* and *bis* signify once and twice respectively. Nevertheless, it does not appear that *semivalent* and *bisvalent* have ever been used in chemical literature, though by analogy with *ter* they appear to have equal force and application.

The words *semel*, *bis*, and *ter* are numerical adverbs

with ambiguous meaning. Not only do they signify multiplicity of fact, but also repetition of event. The latter meaning is quite alien to that of valency. A trivalent element may mean an element which exhibits valency periodically on three occasions, as, for example, thrice a week, on Mondays, Wednesdays, and Fridays, but not on other days. Multiple valency indicates simultaneous multiplicity, not periodical repetition. A simultaneous multiplicity of three is indicated accurately and unambiguously in Latin by *trinus* -- three together, or by *triplex* or *tripulus*, both of which signify triple, treble, threefold, or threeply. The prefix common to these words is *tri*.

Similarly, the prefix *uni* is derived from *unicus* -- single, and *bi* from *binus* (*binus*) -- double, pair, or couple, or from *bis* -- twice or double.

Too much stress cannot be laid on the fact, already cited, that *uni*, *bi*, *quadri*, *æqui*, and *multi* in Latin and *uni*, *bi*, *tri*, *quadri*, *equi*, and *multi* in English, are the only prefixes known to precede the letter *v*. The prefixes *quinqvi*, *sexi*, *septi*, and *octi* are established by derivation from *quinqvies*, *sexies*, *septies*, and *octies*, signifying five, six, seven, and eight times respectively, and by analogy with *uni*, *bi*, *tri*, *quadri*, *æqui* and *multi*.

Numerous precedents for the invariable *v* termination of numerical prefixes exist in other sciences. The English words *valve* and *valvular*, already referred to as being similar in form to valency, are in use in botany, zoology, and engineering science. The numerical prefixes in use in these sciences are *uni*, *bi*, *tri*, *quadri*, *equi*, and *multi*, as in *univalvular*, *bivalve*, *trivalve*, *quadri-valve*, *equivalvular*, and *multivalvular*. In botany we have *bifid*, *trifid*, *quadrid*, *multifid*, and *unifarious*, *bifarious*, *trifarious*, *quadrifarious*, and *multifarious*. In botany, conchology, and heraldry we have *bipartite*, *tripartite*, and *quadripartite*. In most sciences we have *uniform*, *biform*, *triform*, *quadriform*, and *multiform*. In no science or art does there appear to be any series of numerical terms in which the prefix *ter* occurs.

There are thus abundant etymological and analogical grounds and precedents for the prefixes **uni**, **bi**, **tri**, **quadri**, **quinqvi**, **sexi**, **septi**, **octi**, **equi**, and **multi**, when used with valency, valent, or valently. The uniformity of termination of these prefixes constitutes a valuable mnemonic aid, the compound words formed with these prefixes are euphonious to a high degree, and their general adoption in chemical science would remove the existing confusion and some of the reproach of jargon.

NEW FERTILISER FACTORY IN BRAZIL

A new factory is to be erected in Brazil by the Cia. Hidro-electrica de Adubos Chimicos e Alkalis, with the aid of subventions from the Federal and State Governments, for the manufacture of fertilisers by a process for the synthesis of ammonia from atmospheric nitrogen. The company anticipates an output of 75,000 tons both of nitrogenous and phosphatic fertilisers, and will make provision for increasing its capacity. At present Brazilian agriculture consumes roughly 100,000 tons of nitrogenous fertilisers and 200,000 tons of phosphatic fertilisers annually, and the demand is growing.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

ANNUAL GENERAL MEETING, JULY 4 to 8, 1927

RAILWAY FACILITIES

The Railway Companies of Great Britain (except the Metropolitan, the Metropolitan District, and London Electric Railway Companies) have agreed to issue tickets at the ordinary single fare and one-third for the double journey to persons travelling to Edinburgh to attend the meeting. Tickets will be available from Saturday, July 2, to Saturday, July 9.

It is urgently requested that all persons going by rail to Edinburgh for the meeting will take advantage of this concession.

ANNUAL REPORTS OF THE PROGRESS OF APPLIED CHEMISTRY - VOL. XI

This volume of the Annual Reports (covering the year 1926) is now ready, and copies are being despatched to those who have subscribed for them.

The price of the volume is 7s. 6d. to members of the Society and 12s. 6d. to non-members. Fellows of the Chemical Society, who are not members of the Society of Chemical Industry, can purchase the book at the price of 10s.

Orders for copies, accompanied by the appropriate remittance, should be sent to the General Secretary of the Society.

EDINBURGH AND EAST OF SCOTLAND SECTION

The fifth ordinary meeting was held jointly with the Local Section of the Institute of Chemistry in the Hall of the Pharmaceutical Society, Edinburgh, on February 14, 1927, Mr. J. Adam Watson in the chair.

A paper by Mr. B. D. W. Luff on "The use of the microscope in qualitative analysis" was read.

In many branches of chemistry the utility of the microscope has long been recognised, but much more extended use might be made of microscopic method than is generally done. In the microscopic method of qualitative analysis the reagents used are such as give precipitates of a definite crystalline structure, and the characteristic appearance of these crystals is used as a means of establishing the identity of the substances under examination. The reactions themselves are generally carried out on a microscope slide usually made of glass, but in certain cases celluloid or bakelite may be employed.

A few preliminary tests on a material under examination may be made on the slide. For example, its solubility in water or acids may be examined by noting its behaviour when placed in a drop of the liquid. This may be followed by decantation on the slide and allowing the drop of liquid to evaporate and the presence or absence of residue noted. If it is desired to know whether gas is evolved during solution, the solid under test is covered with a drop of gelatin near which, after setting, the drop of reagent is placed. Bubbles of gas, if formed, will be imprisoned in the gelatin, where they will be readily seen under the microscope.

Decantation is performed by holding the slide in a slightly inclined position and drawing a thin channel of the liquid along the surface of the slide with the aid of a platinum wire or a finely-drawn-out glass rod. Filtration is effected by pressing a narrow glass tube having a flat ground end on to a filter paper resting on the slide, and bringing the filter paper near to the drop of the liquid. The liquid is drawn into the tube by gentle suction, and in this way passes through the filter paper, where the precipitate is retained.

Whilst the presence of a number of metals interferes with the formation of characteristic crystals in many instances, there are for every metal three or four different tests which may be applied, and with a little practice it is a comparatively simple matter to decide upon the presence or absence of the commonly-occurring metals by following up one test with one or more other tests.

This method of qualitative analysis is particularly valuable in determining the nature of materials of which only small quantities are available. In this way small specks of foreign matter or surface dust on manufactured articles or material in process can be identified.

A further point in favour of the micro-chemical method is that reagents are used in such small quantities that economy is effected both in material and in space occupied: a complete set of reagents in small drop bottles occupying no more space than is taken up by two or three ordinary reagent bottles.

Mr. J. Adam Watson followed the reading of the paper with a few remarks on the use of the microscope—particularly the petrological instrument—and described the classification of crystals by this means.

YORKSHIRE SECTION

The second meeting of the session held by the Yorkshire Section of the Society of Chemical Industry took place on November 15, at the Great Northern Hotel, Leeds, when a paper on "The chlorination of wool" was read by Mr. J. B. Speakman, M.Sc., and Mr. A. C. Goodings, M.Sc. Mr. B. A. Burrell, Leeds City Analyst, presided.

The paper was divided into two sections, the first of which was concerned with the cause of unshrinkability, and the second with the amounts of chlorine required to produce that condition with wools known to possess widely different milling properties.

Dealing with the cause of unshrinkability, the actions of chlorine and hypochlorous acid on wool were studied microscopically. Apart from the elasticum reaction, which occurs only with chlorine, no drastic alteration of the fibre could be detected. But as soon as the chlorinated fibres are treated with soap or soda solution profound changes take place. The outer layers of the fibre gelatinise and swell enormously. With the amounts of chlorine used in practice, a layer of jelly is formed between the scales and the unattacked core of the fibre. This jelly layer causes unshrinkability because it renders the scales incapable of causing the fibre-travel necessary for shrinkage. It is also responsible for the bad wearing properties of chlorinated wools; the jelly layer and its surrounding scales are easily removable by friction. Good wearing properties could be restored by any process which would cause the jelly layer to shrink and harden to the unattacked core of the fibre, but in order

to ensure unshrinkability sufficient chlorine must be used to cause the scales as well as part of the cortex to gelatinise. It was shown that mordanting chlorinated wools with chromium did restore good wearing properties. The search for a similar agent for undyed goods is being continued.

Cloths of the same structure, made from three different wools, were treated with varying amounts of chlorine and their milling shrinkages determined. In only one case was absolute unshrinkability attained, namely, with Oxford Down wool. Curves showing the relation between shrinkage and the percentage chlorine employed were given for both acid and soap milling. Analysis of the curves showed that the amount of chlorine required to produce absolute unshrinkability is a complex function of many variables:—the kind of wool and its fineness, the yarn structure and the cloth structure. It was further demonstrated that, while absolute unshrinkability is definitely attainable, the limiting factor is that of diffusion, i.e., the difficulty of ensuring even chlorination of all fibres.

An interesting discussion followed, in which Messrs. Rusby, Pickering, Atkin, King, and Dr. Lloyd took part.

The Yorkshire Section collaborated with the Society of Glass Technology to discuss "Silicate analysis" in a meeting held in the Applied Science Department of Sheffield University, on February 16. Members of the Sheffield Metallurgical Association, the Sheffield Section of the Institute of Metals, and the Sheffield Society of Engineers and Metallurgists also took part. Mr. Butterworth presided.

Mr. W. H. Withey, B.A., read a paper entitled "A critical survey of methods for the analysis of the simpler glasses." He pointed out that the glasses comprised in the scheme normally contained silica, iron oxide, alumina, manganese oxide, magnesia, soda and potash, with sulphate, chlorides, and sometimes the oxides of arsenic and antimony in small proportions. The soda-lime series of glasses was included, and lead glasses differed only in that they contained lead. Borosilicate glasses containing zinc and other glasses of more complex composition were excluded. Referring to the question of the limits of accuracy possible in glass analysis, the author pointed out that the adoption of any standard became naturally a matter for personal opinion and experience. It was not unreasonable to suppose, however, that the limits of accuracy for the major constituents were in the order of 0 ± 0.08 , calculated on the weight of the original material, and that the total for the best analyses should fall within the limits 99.75 to 100.20. Only two methods of decomposition of glass for analysis were now in common use, viz.: fusion with sodium carbonate, or a mixture of sodium carbonate with potassium carbonate, and decomposition with hydrofluoric acid and sulphuric acid, or, more rarely, ammonium fluoride and sulphuric acid. There was good evidence for condemning the use of potassium carbonate, and it was therefore not recommended for use in the most accurate analyses. In the determination of silica, the old practice of prolonged heating at 120°, or even higher, was now entirely discredited, and must be abandoned. The following precautions were necessary in the accurate estimation of

silica:—Fusion with not too large an excess of sodium carbonate; five to six times the weight of glass was ample. Solution in sufficient water so that on acidification granular silica was formed; evaporation to dryness and heating on the water bath or in the oven not exceeding 110° for a comparatively short period (half to one hour); solution in dilute hydrochloric acid, followed by filtration and washing with cold water; sufficient "blasting" of the silica; treatment of residue with hydrofluoric acid and sulphuric acid to determine impurities, followed by "blasting" and re-weighing of crucible; addition of silica from alumina precipitate, and deduction of any silica from re-agents and correction for loss of weight of crucible. Two evaporations were sufficient for any but the most accurate work. In the determination of iron and alumina, only two methods were in common use, viz.: separation as basic acetate of iron and alumina, and precipitation by means of ammonium hydroxide, but neither of these two methods was entirely satisfactory. Difficulty arose from the presence of manganese from which alumina and iron were separated by ammonia with some difficulty. The estimation of silica and alumina presented the greatest pitfalls for the analyst.

In the course of a brief discussion which followed, Captain Wood enquired if it was assumed that all the residue after treatment with hydrofluoric acid consisted of alumina only, and Mr. Withey, in reply, said that quite frequently a small quantity of calcium was left.

Miss Violet Dumbleby, M.Sc., asked if Mr. Withey had any figures which showed the relative value of evaporations conducted in platinum and in porcelain vessels, and if there was any marked difference. Mr. Withey replied that his experience was that it was extremely difficult to obtain a perfectly clean platinum basin for use, and difficult to see when all precipitate was removed from platinum.

Miss Violet Dumbleby read a paper, "Notes on methods used in the analysis of glasses," in the course of which she said that it was her experience that manganese was best precipitated by bromine, whilst for the determination of alkalis she thought the Lawrence Smith method was the best. She expressed the hope that manufacturers would not take to putting titania and zirconia into glasses in very great quantities. They caused the analyst a very, very great deal of trouble; indeed, more trouble than any other oxides. If manufacturers put them into glasses she hoped at least they would not send the glass for analysis.

In a brief discussion which followed one speaker suggested that in the future analysts would find considerable difficulty with beryllium oxide in glass. It would be much worse to deal with than titania. Miss Dumbleby expressed the hope that the day was very far distant when they would encounter beryllium in glass. She appreciated that the difficulties would be very real if the eventuality mentioned occurred.

"The analysis of refractories" was discussed by Mr. W. J. Rees, B.Sc. Tech.—With most refractories the finest grinding of the sample before fusion was necessary, whilst for a glass an exceedingly fine division was not absolutely necessary. For fireclays containing 3% or more of iron oxide and titania, it was undesirable to heat the evaporated fusion at a temperature higher

than 105° C. He found that above 105° there was an increase in the contamination of the silica. He contented himself with evaporating on a water bath. He cordially seconded Mr. Withey's recommendation of the use of methyl red as an indicator: it was very useful when the materials contained large proportions of lime and magnesia. Reference was then made to the analysis of magnesite bricks, basic dolomites, sillimanite, chrome refractories, and silica bricks. Sillimanite gave trouble in analysis unless care was taken in the fusion. For the determination of alkalis in fireclays the author relied on the Lawrence Smith method. He expressed his great interest in a suggestion made by Dr. W. Rosenhain to use superheated water for the first breakdown of the original material. He (Mr. Rees) had tried the method in a small way, without getting very good results. The method, however, was worthy of further investigation.

A paper entitled "Notes on the analysis of silicate slags" was read by Mr. T. P. Colclough, M.Sc., B.Met.—A close knowledge of the compositions of the slags formed in metallurgical processes was of fundamental importance, and methods for their rapid and reasonably accurate analysis were necessary. A table was given showing typical analyses of various kinds of slags, from which it was seen that the slags were generally much less siliceous than glasses. Methods were then indicated for the determinations of silica, iron oxide, alumina, phosphate, manganese oxide, lime, magnesia, sulphur, and vanadic oxide. In addition to the more precise methods indicated, it was necessary, for the control of commercial processes, to be able to make analyses of slags for certain constituents with sufficient rapidity and accuracy to be a guide to the person operating the plant. In each of the separate operations in iron and steel making at least one constituent of the slag was of vital importance in either the control of the operation or the manner of disposal of the material produced, and a method for the determination of that constituent must be available.

CALENDAR OF FORTHCOMING EVENTS

- Mar. 4. SOCIETY OF CHEMICAL INDUSTRY. *Joint Meeting of the Manchester and Liverpool Sections*, to be held in the Textile Institute, 16, St. Mary's Parsonage, Manchester, at 7.30 p.m. Visit to the Shirley Institute of the British Cotton Industry Research Association, Didsbury, Manchester, will precede the meeting. A paper will be read later on "Chemical control in the cotton bleaching industry," by D. Clibbens.
- Mar. 7. CERAMIC SOCIETY, North Staffordshire Technical College, Stoke-on-Trent, at 7.30 p.m. "Refractories for the pottery industry. Part 2, saggers, setters, cranks, etc.," by W. Emery.
- Mar. 7. SOCIETY OF CHEMICAL INDUSTRY, *London Section*. Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. "Recent progress in the glass industry," by Prof. W. E. S. Turner.
- Mar. 7. GLASGOW UNIVERSITY ALCHEMISTS' CLUB. Annual General Business Meeting, at 7.30 p.m.
- Mar. 7. INSTITUTION OF THE RUBBER INDUSTRY, *London and District Section*. Engineers' Club, Coventry Street, W.1, at 8 p.m. "Some electrical properties of rubber," by P. Dunsheath.

- Mar. 7. **INSTITUTE OF CHEMISTRY, Manchester and District Section.** "Plant chemistry," by Prof. E. C. C. Baly.
- Mar. 8. **INSTITUTION OF PETROLEUM TECHNOLOGISTS.** Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m. "Two shallow oilfields in Texas," by Dr. A. Wade.
- Mar. 8. **SOCIETY OF CHEMICAL INDUSTRY, Birmingham and Midland Section.** Annual Meeting. University Buildings, Edmund Street, Birmingham, at 7.30 p.m. "The commercial synthetic resins and their products," by H. W. Rowell. "The chemical oxidation of the constituents of sewage: The action of hydrogen peroxide," and "Studies on the dissolved oxygen absorption test," by E. A. Cooper and W. H. Read.
- Mar. 8. **MANCHESTER LITERARY AND PHILOSOPHICAL SOCIETY,** 36, George Street, Manchester, at 5.30 p.m. "A new method of electro-conductivity titration," by E. Butterworth. "Some results obtained with a new atmospheric deposit recorder," by J. R. Ashworth.
- Mar. 9 and 10. **INSTITUTE OF METALS.** Annual General Meeting (For particulars see CHEM. & IND., 1927, p. 106.)
- Mar. 9. **ROYAL SOCIETY OF ARTS,** John Street, Adelphi, W.C.2, at 8 p.m. (Ordinary Meeting.) "The utilisation of gas coke," by Dr. E. W. Smith.
- Mar. 9, 10 and 11. **INSTITUTION OF CHEMICAL ENGINEERS.** Conference and Fifth Annual Corporate Meeting and Annual Dinner. (For further particulars, see the issue for Feb. 18, p. 151).
- Mar. 9. **UNIVERSITY OF LONDON,** University College Gower Street, W.C.1, at 5.30 p.m. "Photography of documents: Object and methods," by Sir W. Schooling.
- Mar. 10. **OIL AND COLOUR CHEMISTS' ASSOCIATION.** Rooms of the National Federation of Paint Manufacturers, 8, St. Martin's Place, Trafalgar Square, London, W.C.2, at 8 p.m. "Recent research on the protection of steel with paint," by Dr. J. A. Newton Friend.
- Mar. 10. **INSTITUTION OF THE RUBBER INDUSTRY, Manchester and District Section.** Textile Institute, 16, St. Mary's Parsonage, Manchester, at 7.30 p.m. "Difficulties of rubber-proofed garment manufacture," by Major N. Blond.
- Mar. 10. **OPTICAL SOCIETY.** Ordinary Meeting. Imperial College of Science and Technology, South Kensington, S.W., at 7.30 p.m.
- Mar. 11. **INSTITUTE OF METALS,** Swansea Local Section. University College, Singleton Park, Swansea, at 7.15 p.m. "The influence of oxygen on copper and other non-ferrous metals," by F. Johnson.
- Mar. 11. **WEST OF SCOTLAND IRON AND STEEL INSTITUTE.** "Sintering of iron ores, Giessecke Process," by C. P. de Buch.
- Mar. 16. **SOCIETY OF CHEMICAL INDUSTRY, South Wales Section.** Technical College, Mount Pleasant, Swansea. "Further notes on pure chemicals," by E. A. Tyler.
- Mar. 16. **SOCIETY OF CHEMICAL INDUSTRY, Liverpool Section.** Annual Section Meeting. "Biochemical aspects of the nature of life," by Prof. J. C. Drummond. (Not on March 18.)

INSTITUTION OF CHEMICAL ENGINEERS

Members Elected February 9, 1927

Members

- Cornelius Philip Finn, B.Sc., F.I.C., Manager, Washeries and Coke Oven Departments, also Brickworks Department of Manvers Main Collieries, Ltd.
- John William Mitchley, M.I.Mech.E., Chemical Engineer and Gas Engineer to Blair, Campbell & McLean, Ltd., Govan.
- Frank Sturdy Sinnatt, M.Sc. (Tech.), F.I.C., Assistant Director of Fuel Research, Department of Scientific and Industrial Research.
- John Dawson Troup, M.I.Mech.E., Editor, "Engineering & Boiler House Review."

Associate-Members

- Clifford Ernest Brooks, Engineer and Draughtsman, United Alkali Co., Ltd.
- Thomas Haworth, Chemist and Assistant Gas Engineer, Oswaldtwistle U.D.C. Gasworks, Church.
- William Hall Simmons, F.I.C., Joint Manager of Plant Dept., Trost Bros., London.
- Alan Speedy, Chemical Engineer to A. G. Spalding & Bros., Ltd., London.
- Francis Colin Sutton, Joint Manager of Plant Dept., Trost Bros., London.
- Douglas Robinson Wattleworth, Assistant Manager, Coke, By-Product and Tar Distillation Works, Harrington Coke Ovens, Ltd.

GLASGOW UNIVERSITY ALCHEMISTS' CLUB

Dr. T. S. Stevens presided over the meeting on February 23, when an address on "Problems of chemotherapy" was delivered by Prof. C. H. Browning.

Chemotherapy, it was explained, was the treatment of infective disease by substances of known chemical constitution in order to destroy the causal agent in the body. The reaction of a drug with the serum of the body had always to be considered, and although a particular compound might be efficient in controlling the growth of one organism, the efficiency might not be general. The work of Koch, Ehrlich and Morgenroth was reviewed, and the progress made with the use of basic dyestuffs was commented upon. The time factor—the so-called "bacteriostatic reaction" of organic antiseptics—was frequently overlooked in evaluating the efficiency of a drug. Under cultural conditions it might prove slow in action, but when administered to the living body the virulence of the causal organisms might be so reduced that the body itself would control the disease. The effect upon bactericidal properties of modifying the chemical constitution of some of the acriflavine substances was shown, and the recent results obtained by the use of metallic salts were given. The outlook was hopeful that substances would be prepared which would prove as successful in the control of diseases of bacterial origin as had been obtained in the case of those due to trypanosomes.

BRITISH ASSOCIATION OF CHEMISTS

The annual dinner of the London Section took place at the Engineers' Club on February 19. Prof. G. T. Morgan, president of the Association, was in the chair.

In his opening speech Prof. Morgan alluded to the necessary place filled by the Association among societies of chemists. He pointed out that the Association was registered as a trade union, not because it desired to employ the strike weapon, but because a seat upon industrial councils could not be held by organisations which did not definitely represent either employer or employed. The Association's work was complementary to that of the Institute of Chemistry. In certain directions the combined efforts of the Association and of the Institute of Chemistry were directed towards the same end—as, for example, in the matter of the title chemist. Too many students drifted into chemistry without a true vocation for it, a circumstance which was overcrowding the profession, and indirectly harming it in other ways. Too often the reply to a question regarding future academic studies came automatically: chemistry, physics and mathematics. This, he felt, was due to the great preference given to the subjects in school curriculums. If more attention were paid a little earlier to other branches, the students would have more to choose from, and a greater freedom in their choice. But in spite of disadvantages chemists were better off than they were thirty years ago, and this was due largely to efforts of such societies as the Institute of Chemistry and the British Association of Chemists, who were doing a great deal to raise the status of the profession.

In proposing the toast of "The London Section," Mr. Hy. T. F. Rhodes (General Secretary) indicated what important work the chemist did for the community, and said the Association had grown up with the chemist's realisation of his duty to the community, and it sought to obtain public recognition for the profession.

Mr. S. R. Price, chairman of the Council, in his reply, summarised the lines upon which the Association had been working. He pointed out that with such a big programme a great deal of hard work was necessary.

Dr. Paul Haas proposed the toast of "Kindred Societies," and Mr. James Stewart, chairman of the London Section of the Institute of Brewing, said in his reply that chemistry was becoming more and more important in its application to industry. He had been struck while abroad with the attention which was being paid to the cultivation of grain, and to agricultural research. The chemist took a great part in that and the results obtained were most remarkable. Again, in this country a great deal more attention was being paid to research, and there was no question at all that money spent on research was well spent. The chemist was coming into his own, and as he deserved, his status was improving. Mr. E. Hinks also replied to the toast of "Kindred Societies" on behalf of the Society of Public Analysts.

Miss W. Wright responded to the toast of "The Ladies," which was proposed by Mr. A. J. C. Cosbie.

PHYSICAL SOCIETY

At the Annual General Meeting on February 11, the Council for the year 1927—28 was elected as follows: President, Prof. O. W. Richardson; Secretaries, A. O.

Rankine and J. Guild; Treasurer, R. S. Whipple; Ordinary Members, R. W. Paul, A. M. Tyndall, T. Smith, A. Ferguson, J. S. G. Thomas, D. W. Dye, Sir Richard Paget, E. N. da C. Andrade, E. Griffiths, and A. B. Wood.

The fourth Duddell Medal was awarded to Mr. F. Twyman, F.R.S., technical and managing director of Messrs. Adam Hilger, Ltd.

In his presidential address, Prof. O. W. Richardson reviewed "The present position of atomic physics." It was, a few years ago, anticipated that the discovery of the electron, Planck's laws of thermal radiation and Bohr's scheme of spectra, had finally stabilised the position of atomic physics. In recent years, however, a number of experimental facts which do not fit into this framework of ideas have been discovered. The principal of these are: (1) Whereas Bohr's scheme contemplates the specification of spectra in terms of quantum numbers which are *whole* numbers, the analysis of some spectra, more especially band spectra, necessitates the introduction of fractional quantum numbers, e.g. $\frac{1}{2}$. (2) Anomalies have been found in the analysis of the complex Zeeman effect exhibited by complex lines subjected to a weak magnetic field. These anomalies cannot be reconciled with the theory of the effect based upon the postulation of 3 quantum numbers. (3) The experimental fact that the mean free paths of argon atoms become extremely *long* when the atomic velocities become *small* cannot be easily reconciled with the theory. (4) There is a contradiction in the properties of radiation discussed in terms of the classical and quantum theories. (5) It is difficult to perceive how in the light of current theory the atoms maintain their respective identities. (6) The structures of atomic helium and hydrogen cannot be definitely assigned. (7) Anomalies have been discovered in (a) magnetic characteristics of the elements; (b) the excitation of soft X-rays; and (c) the reflection of electrons by atoms. In order to resolve some of the difficulties Bohr postulated his Correspondence Principle, which in essence reduces to the assumption that atomic or high-frequency phenomena are governed by the laws of the quantum theory whilst low-frequency phenomena are controlled by the classical theory. This transition from classical dynamical theory to quantum theory cannot be regarded as satisfactory, and nowadays has been replaced by the newer mechanics devised separately by Heisenberg and Dirac. Alternatively the attempt to resolve the difficulties of present-day atomic physics is made along the lines of wave mechanics developed by Schrödinger and by L. de Broglie, which is ultimately based upon work done by Hamilton 100 years ago, in which he directed attention to the use of optical theory in solving the problems of mechanics. de Broglie assumes that just as the corpuscular theory of light breaks down when the physical dimensions involved are comparable with the dimensions of the "waves," so the laws of gross mechanics break down when applied to atomic systems. The mathematical development of the theory is difficult, but bears some resemblance to that characterising classical dynamical theory and has succeeded in eliminating most of the difficulties referred to above.

INSTITUTION OF CIVIL ENGINEERS

At the meeting on February 8, a paper entitled "Applications of power on gasworks" was presented by Mr. H. C. Smith, A.M.I.C.E.

After a brief mention of the uses of pneumatic, hydraulic, and gas power, the applications of steam on a gasworks with an output of more than 15 million therms per annum were detailed. In manufacturing this gas approximately 148,000 tons of coal and 2,700,000 gal. of gas oil are used; 87,000 tons of coke and breeze are obtained as a by-product, of which 18,500 tons of coke are used for the manufacture of water-gas and 8600 tons of coke and 26,700 tons of breeze as boiler fuel. The steam generated on an average day is shown to be at the rate of 44,110 lb. per hour from and at 212° F., or 16,718 h.p. The cost of generation, exclusive of capital charges, but including fuel, labour, water, repairs, and maintenance was shown to be 11.3d. per 1000 lb. of steam, or 25.3d. per ton. The quantity of steam generated is allocated in the following manner to the various pieces of plant and machinery for which it is used:—

	Lb. per hour from and at 212° F.
Carburetted water-gas	3,458
Steaming vertical retorts	1,581
Generating electricity	4,022
General power purposes	33,105
Boiler grates, ejectors, etc.	1,944
	<hr/> 44,110

From a balance drawn up between the steam generated and the h.p.-hr. output obtained by its use, an efficiency of transmission of energy from heat in steam to b.h.p.-hr. was shown to be 3.5%. This low efficiency is due to the fact that steam is used in a large variety of scattered units, the majority of which have been in use for several years and are working under non-condensing conditions.

The savings in labour to be effected by linking up the whole of the boiler plant and by converting certain of the hand-fired boilers to mechanical stoking was shown to be £790 per annum on a capital outlay of £1810. This saving is in addition to any saving in fuel due to the levelling up of the load and to the increase in the proportion of steam made on mechanically-operated boilers and waste-heat boilers.

The generation and use of electrical power on a gasworks was dealt with. The efficiency of the generation of electricity from heat in steam supplied to engines to heat in electricity generated was shown to be 10.1%, the efficiency of the generation and transmission of electricity from heat in steam supplied to engines to brake horse-power developed on works motors being 6.1%, which is comparable with the efficiency of 3.5% given for the use of steam power.

Of the 16,718 h.p. of steam generated, 2647 h.p. is used for gas-making and purposes other than power, and 14,071 h.p. for power purposes. Of the latter,

1524 h.p. is converted into electrical energy, giving 147.8 h.p. of electricity.

The author suggested that in designing a new gasworks of a similar size to the one under review power would be most economically produced and applied as electricity. This could be generated by steam at a central station, the bulk of the steam being produced by waste-heat boilers. Instead of steam being used in small units at scattered points, it would then all be used at one point, the exhausts of engines using it discharging into suitable condensing plant.

Assuming that the mean total power required on a new works would be the same as on the existing works, 494.0 b.h.p. would be required on an average day. If this were applied as electricity with an efficiency from steam to motor of 6.1%, it would be necessary to generate only 8098 h.p. of steam instead of 14,071 h.p. as at present. A plant capable of generating 818 h.p. or 610 kw. would be required.

With this plant a higher efficiency should be obtained than on the 150-kw. plant now in use, and assuming this to be 14%, the steam required would be only 5843 h.p. The saving in steam would amount to 233 tons per diem, which at 25.3d. per ton gives a saving of £8963 per annum.

If only 5843 h.p. of steam were required instead of 14,071 h.p. as at present, it is shown that it would be possible to make 83% of the steam required on the works for gas-making and power purposes (apart from that necessary for the working up of by-products) on waste-heat boilers under average day conditions. Under existing conditions it would only be possible to make 42.1% of the steam required from the waste heat of the various carbonising processes.

The works produce 3000 million cb. ft. of gas per annum, having a calorific value of 500 B.Th.U. per cb. ft. Of this production 25% is water-gas. To make this gas 148,000 tons of coal are required. From each ton of coal carbonised 950 lb. of steam from and at 212° F. can be raised by waste-heat boilers. This equals 385,000 lb. per diem. A quantity of 30 lb. of steam per 1000 cb. ft. of carburetted water-gas, which equals 61,000 lb. per diem, can also be raised. Therefore the total steam available from waste heat is 446,000 lb. per diem. The requirements under present conditions = $44,100 \times 24 = 1,058,640$ lb. per diem. Therefore the percentage that can be raised from waste heat = 42.1%.

Assuming that the whole of the power requirements were supplied as electricity generated at an efficiency of 14%, the requirements for power would be $5843 \times 24/0.379 = 370,000$ lb. of steam per 24 hr. In addition, 167,600 lb. are required for gas-making and other purposes, making a total of 537,600 lb. Under these conditions 83% of the total requirements could be met by waste heat.

MERGER IN THE GERMAN ALCOHOL INDUSTRY

A merger of 10 of the chief German yeast and alcohol plants is reported from Berlin. The new company will pool processes and effect economy in production, lower prices being anticipated.

CORRESPONDENCE

THE TESTING OF DISINFECTANTS

SIR,—I feel obliged to Messrs. S. and E. K. Rideal and A. Seiver for their letter in your issue of Feb. 18, since it definitely establishes p_H 7.6 as the reaction value of Rideal-Walker broth. The main purpose in writing my paper was to draw attention to the effect of differences in the reaction of the broth and to show the necessity for fixing the reaction at some definite value, but I do not think that the wording of my paper can be interpreted as making a positive recommendation for a reduction of the p_H value to 7.0.

I favour the new method of standardising the broth as outlined in their letter, particularly if the titration is conducted with the aid of a comparator and the colour of the indicator is controlled by a standard buffer solution. It may be noted, however, that this method of standardising the broth to p_H 7.6, by direct neutralisation to phenolphthalein, differs from the published technique by omitting the after addition of 1.5% normal hydrochloric acid; this alteration may be responsible, in part, for the discrepancies in the reported results of different operators.

Yours faithfully,

QUINTIN MOORE, JUNR.

SIR,—To those interested in the above subject, the authoritative views of Dr. Rideal and his co-workers, as reported in your issue of Feb. 18, would be very welcome. Now that Dr. Rideal has stated definitely that the reaction of Rideal-Walker broth is p_H 7.6, it is to be hoped that this fact will be included in the next issue of the "Approved Technique."

While this subject is under discussion, it would be interesting to know if investigations have been made as to the effect of variations in the composition and reaction of the agar culture medium. No particulars regarding its preparation are given in the "Approved Technique," and, in view of the remarkable effect on the coefficient shown by Mr. Moore's tests to be caused by variations in the broth, it seems desirable to enquire what, if any, alteration is caused by the use of varying agar media. Even if the resistance to disinfectants of two cultures grown on different agar media is slight, it seems justifiable to assume that the divergence in properties of the two cultures would increase from month to month.

Would it not be advisable to include in the "Approved Technique" a recipe for the preparation of the agar medium; or, perhaps better, stipulate that a fresh agar culture be obtained monthly from the Lister Institute, thus ensuring that all investigators are working with the same culture on any given date?

Yours faithfully,

JAS. GIBSON

PERSONAL AND OTHER ITEMS

Mr. R. E. Palmer, who is the consulting engineer in London to the Rio Tinto Company, has been nominated president of the Institution of Mining and Metallurgy. The nomination is highly appropriate, as Mr. Palmer is a Canadian by birth, and the second Empire and Metallurgical Congress will be held in Canada during his year of office.

Mr. G. M. Nave, B.Sc., assistant chemist in the Engineer's Department of the Newcastle-upon-Tyne & Gateshead Gas Co., has secured an appointment with the Northern Coke Research Committee at Armstrong College, Newcastle-upon-Tyne.

Mr. E. D. Theband, president of the Niagara Frontier Laboratory and at one time chief chemist to the Carborundum Company, has died at Buffalo, aged 54 years.

We regret to learn of the death of Major J. M. Gibson, manager of the Buckley Brick and Tile Company, and responsible for the development of the well-known acid-resistant Buckley clay products. Major Gibson was one of the original members of the Society of Chemical Industry and was an indefatigable worker in the public interest.

With great regret we announce the death of Dr. Luigi Casale, the inventor of the Casale process for the manufacture of synthetic ammonia, at the early age of 45 years. An obituary notice will appear in our next issue.

The death is announced of Dr. Otto Schönherr, known in technical circles in Germany as "Salpetersäure-Schönherr," on account of his arc-process for the fixation of atmospheric nitrogen. Some Schönherr furnaces are in operation in Norway and Germany.

An Imperial Agricultural Research Conference, at which delegates from the various parts of the Empire will be present, is to be held in London, beginning on October 4. The organising committee appointed by the Ministry of Agriculture has already met under the chairmanship of Lord Bledisloe. The Empire Marketing Board is financing the Conference.

The late Mr. T. D. Cooper, managing director and chairman of the Val de Travers Asphalte Co., Ltd., left £7457 with net personalty £6245.

The first congress of the International Association of Soil Science will meet in Washington, D.C., on June 13. Titles of papers to be presented should be sent to Dr. J. G. Lipman, New Brunswick, New Jersey, U.S.A. The conference will include visits, and exhibits relating to soil science, as well as the discussion of papers.

British Industries Fair

The King and Queen visited the Fair on Friday February 25, and stayed for two hours. Their Majesties showed much interest in the exhibit of the Imperial Institute, which includes specimens of plant and animal products and minerals from different parts of the Empire. Of special interest were the exhibits of oilseeds, shea butter, cascara bark, and the samples of Transvaal platinum ores, the examples illustrating the uses of nickel, chromium, and cobalt alloy steels and the interesting exhibit showing the many uses of aluminium.

In the Chemical Section, the King was interested, at the stand of Albright & Wilson, in their "Silicon ester" which is used for preserving and restoring buildings, striking illustrations being given by restorations of pieces of stonework. A recent development is the use of "Silicon ester" as a medium for painting frescoes and other forms of the painter's art.

So far the number of buyers from countries abroad has been much greater than at last year's Fair, an increase of over 60% being recorded for one day. During one day alone over 6000 buyers visited the Fair.

Research in the Paint, Colour and Varnish Industries

A brochure bearing the title "Research," which has been issued by the newly formed Research Association of British Paint, Colour and Varnish Manufacturers, should interest all those engaged in the paint, colour, varnish and related industries, who have not yet become members of the Association. The brochure points out that the industry has emerged but recently from centuries of stagnation into a whirlwind of discoveries and inventions, and in making a powerful plea for research, observes that only the best can be expected when not art alone, but science and art together lead the way. The imposing list of problems in paint, varnish and colour technology that require solution which is given, should convince the most doubtful of the need for research. The Association's address is 8, St. Martin's Place, London, W.C.2, and its Research Station and Laboratories are in Waldegrave Road, Teddington, Middlesex. A strong Technical Advisory Committee is engaged in drawing up the programme of research.

Conference of French and British Industrialists

Following on the recent conference between German and British industrialists, the Federation of British Industries has arranged a similar meeting between French and British representatives of industry. The French delegates include M. Duchemm, president of the General Confederation of French Production and of the Union of Chemical Industries, M. de Peyerimhoff, the head of the coal-producers' organisation, M. T. Laurent, of the "Compagnie des Forges et Aciéries de la Marine et d'Homécourt," M. Fougère, M. J. le Blau, M. C. Dufour, president of the Federation of the Syndicates of Light Metal Industries, M. Gounod, vice-president of the Union of Chemical Industries, M. L. Ribot and M. Roche, president of the Syndicate of Special Chemical Industries. The British representatives include Sir Max Muspratt, Sir Peter Rylands, Mr. (Clive) Cookson, Mr. F. C. Fairholme, and Mr. W. H. Lee. The subjects include the economic and fiscal treatment of nationals and companies of one country admitted to settle in the territory of another, the organisation of production, including, in particular, international agreements, the collection and exchange of statistics relating to production, customs questions, and so on. There will be also a discussion on the question of whether trade fairs and exhibitions should not be limited—whether the value of exhibitions to industry has now become less important than it was shortly after the war.

Canadian Hydro-Electric Developments in 1926

The Dominion Water Power and Reclamation Service has prepared a Bulletin giving a review of hydro-electric and water power development in Canada during 1926, which shows that year to have been one of widespread activity in this important industry. Approximately 266,000 h.p. was added during the year, bringing the total installation in the Dominion to 4,556,000 h.p.

The most important work of the year was that accomplished by the Gatineau Power Co. in Quebec, in the virtual completion of two plants on the Gatineau River, and the initiation of construction on a third, these three plants having a total designed capacity of 530,000 h.p.

Whilst the figure of actual installation is substantial it falls short of indicating the magnitude of constructional activity during the year. Projects are under way, a number being near completion, which will ultimately add to the Dominion's total more than 1,700,000 h.p., whilst others in active prospect promise a further addition in excess of 1,000,000 h.p.

Canadian Coal Output

Canadian coal mines produced 18% more coal in 1926 than in 1925 according to production figures now available. In 1926 the output was 16,105,000 tons compared with 13,134,968 tons in the previous year. The 1926 production was distributed as follows: Nova Scotia, 6,810,000 tons; Alberta, 6,117,000 tons; British Columbia, 2,634,000 tons; Saskatchewan, 376,000 tons; New Brunswick, 168,000 tons.

During 1926 Canada's total importation of coal amounted to 17,520,000 tons, and her total exportation was about 900,000 tons. Of the total imports 17,120,000 tons came from the United States, and the remaining 400,000 tons from Great Britain, Germany and the Netherlands. Total coal made available for consumption during the year, according to the Dominion Bureau of Statistics, was 32,725,000 tons.

Mining in South Africa

The mineral production of the Union during 1926 exceeded £58,500,000 in value, thus establishing a record. The chief features of the past year were the arrival of platinum as an important factor, the increase in diamond production, the revival of corundum exportation, and the activity in asbestos mining. The production of chrome ore declined, and lead-mining has proved a further disappointment. An American company which controls the extensive manganese deposit at Postmasburg is to examine the deposit with a view to future development. (*Min. Mag.*, February, 1927.)

Motalin

The name under which anti-knock motor fuel is being marketed in Germany is "motalin," which consists of benzol containing 0.2 to 0.25% of iron carbonyl. The iron carbonyl is supplied for further dilution in the form of a 50% dilution in benzol. (*Z. für Gewerbehyg.*, 3, 203).

German Chemical Industry

The nominal capital of the A.-G. für Chemische Produkte H. Scheidemandel has been reduced from 25 million to 10 million marks.

Chemical Developments in France

The Etablissements Kuhlmann has decided to offer in Switzerland an issue of 15,000,000 Swiss francs, in 1000 fr. shares bearing 7% interest, to provide funds to carry out a big scheme for the manufacture of synthetic ammonia and for the development of the firm's phosphorus-nitrogen fertilisers in France and Belgium, in conjunction with various coal and coke producers.

REVIEWS

INTRODUCTION TO PHYSICAL CHEMISTRY. By F. B. FINTER, M.A. Pp. xvi + 276. London: Longmans, Green & Co., Ltd., 1926. Price 6s.

This book has been written with the object of supplementing the chemistry text-books which are commonly used by candidates for the Higher School Certificate and University scholarship examinations. It covers the ground which is commonly associated with physical chemistry in an introductory and interesting way, giving some idea of the problems which are conventionally relegated to the more advanced study of general chemistry. The author sets out to write attractively, and in doing so makes frequent use of analogies, some of which are distinctly good and likely to impress the student. The book will undoubtedly make a strong appeal to the type of student whose capacity for appreciating scientific principles seems to be enlivened by the humorous touch, although it must be admitted that the text is somewhat scrappy and the information much condensed. There are some statements which, whilst not absolutely inaccurate, are distinctly unfortunate and some of the illustrations are not well chosen. The action of sunlight in causing hydrogen and chlorine to combine is cited not very appropriately as an instance of the conversion of light energy into chemical energy. Whilst there is a very interesting account of indicators and their use, the treatment of catalysis is exceptionally poor. The book as a whole has, nevertheless, distinct merit and can be recommended warmly to first-year University students who are not specialising in the subject.

H. M. DAWSON

POTASH: A REVIEW, ESTIMATE AND FORECAST. By J. W. TURRENTINE, Ph.D. Pp. ix + 188. New York: John Wiley & Sons; London: Chapman & Hall, Ltd., 1926. Price: 15s.

This is a book with a purpose, written entirely from one point of view, which is frankly stated in the preface. It is not a full and unbiassed account of the sources of the world's potash, or of the potash industry, but an account of the sources from which potash may be obtained in the United States, with an estimate, often very optimistic, of the amount of potash which could be obtained from each source, and a forecast of what might be done to render the United States independent of all external, and especially German, sources of potash. The leading theme of the book is stated in the very first sentence, "The ambition and determination to render America independent of foreign countries in respect to her potash supplies resulted immediately upon the realization of that dependence."

Before the war the United States tried to develop its potash resources in the hope of making itself independent of Germany, but under the stimulus of the potash scarcity brought about by the war, the energy with which the U.S. Department of Agriculture and many private firms and individuals set themselves to solve the potash problem was redoubled. An immense amount of pioneering was done in various directions, and in some cases a considerable amount of potash was

produced. All the likely natural sources of potash in brines, salt lakes, and geographical strata were explored, and at the same time the use of seaweed on the large scale was tried, and all manner of by-products from other industries were examined and their value as possible sources of potash considered. In all this work the Bureau of Soils of the U.S. Department of Agriculture took the leading part, and Dr. Turrentine is the official of that Bureau who was in charge of potash investigations. He proposes in this book to put on record for the information and guidance of the future "the relatively enormous amount of work done both by Governmental and private agencies on the technology of extracting potash from the American raw materials." . . . "Only in this way, now that the actual commercial production of potash from most of these sources had been abandoned, can the great expenditure of skill, energy and materials in war-time potash production be made to yield profit for future years."

The first section of the book is a short one, and deals with "Former sources of potash." Like the rest of the book, the point of view is entirely American, and the copious tables given refer only to potash imported into the United States.

Another short section deals with "Foreign potash industries," and dismisses the German potash industry in a few pages, and then shortly refers one after another to French, Polish, Italian, Spanish, and Japanese potash. The Chile nitrate deposits as a possible source of potassium nitrate for the American market are also considered.

The whole of this section, which occupies 37 pages, might well have been omitted or greatly cut down and the space saved devoted to a fuller account of some of the work done in America on new sources of potash and on new processes. The section gives only a superficial account of European sources of potash, which is of little real value either to the expert or to the practical man.

Three-fourths of the book is devoted to the section called "The American potash industry," in which some account is given of the large number of investigations made, chiefly under the auspices of the Bureau with which Dr. Turrentine is connected, into American sources of potash, and of the efforts made to produce potash on a commercial scale in the United States. Much of this section makes interesting reading, but one has an unsatisfied feeling in many cases that more precise and extensive information might have been given as to the details of the investigations, as to the processes tried, and as to the success or otherwise which attended them. The treatment all through is very optimistic, and Dr. Turrentine is thoroughly convinced that, even in peace time, with industries properly organised and carried out on a sufficient scale, with due attention to the production of economic by-products, or to the production of the potash as a by-product from other successful industries, America can make herself independent of European potash, and produce all she requires not only for present conditions, but also for the future, in which great expansion of potash requirements is anticipated.

The sources of potash dealt with in this section are many and varied, and are divided into *kelp*—by which

an American writer means, not seaweed ash, but seaweed itself—surface brines, Continental deposits, silicates and other minerals, industrial wastes organic and inorganic, and subterranean deposits. As a rule, several different sources of potash or several different processes are considered under each of these headings. Thus, under silicates and other minerals, alunite, leucite, feldspar, greensand, and Georgia shales are all considered as sources of potash; and under kelp several different processes and kinds of plant are referred to, though, naturally, the work carried out by the Bureau of Soils receives most attention.

This is a book which was worth writing, and it might be worth the author's while to consider whether it should not be expanded in any future edition. Though, naturally, it is of interest and importance, especially to the fertiliser industry and to agricultural chemists in the United States, there is also much in it which is worth attention in this country. JAMES HENDRICK

LE PROBLÈME DES FERMENTATIONS—LES FAITS ET LES HYPOTHÈSES. By M. SCHOEN, with a preface by Dr. A. Fernbach. Monographs of the Pasteur Institute. Pp. 199. Paris: Masson et Cie, 1926. Price 21-60 fr.

"Le probleme des fermentations a ce privilege singulier de tenir sans cesse en éveil la curiosité des travailleurs de la science." These are the opening words of one of the most vivid scientific monographs we have had the pleasure to read for a long time, and right through the book the author holds the attention of his readers with his dramatic presentation of the "facts and hypotheses" which are combined in the present knowledge of fermentation. Between fact and hypothesis he makes a definite distinction, and the result is a very clear exposition of both.

The headings of the chapters will indicate the idea of the author. Based ultimately on the work of Pasteur, he develops and criticises the theories which have grown up in explanation of the chemical changes occurring in fermentation, showing the invalidity of the experimental basis of some, and clearly marshalling the facts which he believes to be sound. Opening with "Pasteur's theory of fermentation in the light of some new facts"—"The enzyme theory of fermentation," "The enzyme theory applied to bacterial fermentations," and "Alcoholic fermentation and intramolecular respiration," the author passes on to a consideration of the substances which have been regarded as intermediate stages in the conversion of sugar to alcohol. He deals first with "The role of lactic acid in the phenomena of fermentation," and then passes on to the newer views in regard to "The role of pyruvic acid, and of acetaldehyde in alcoholic fermentation,"

"The interpretation of the facts discovered," "The mechanism of bacterial fermentations," and, afterwards, "The bearing of the stereoisomerism of the hexoses on certain phenomena of fermentation," the "Part played by phosphates," and the "Bearing of the reaction of the fermenting medium."

It is understood that an English translation is likely to appear shortly.

PARLIAMENTARY NEWS

Russian Petrol and Kerosene

In reply to Sir Nicholas Gratten-Doyle, Sir P. Cunliffe-Lister stated that imports into the United Kingdom of motor spirit consigned from Russia were, in 1925, 33,111,263 gallons, and in 1926, 55,217,069 gallons. Imports of lamp oil during the same years were 15,796,350 gallons, and 37,494,534 gallons, respectively.—February 15.

Sugar-Beet Factories (Foreign Employees)

Mr. Guinness informed Sir F. Wise that the percentage of foreigners employed in the fourteen beet-sugar factories during the past manufacturing season was 2.3%.—February 23.

COMPANY NEWS

SYNTHETIC AMMONIA AND NITRATES, LTD.

The directors announce an increase in profits for the year 1926, which wipes out the debit balance and leaves a substantial sum to be carried to the credit of the new account. After charging £91,522 for depreciation, the profit was £137,990, compared with £103,647. After deducting the debit balance brought forward of £66,580, there remained £71,410, which it is proposed to carry forward. The daily output of the present plant has been increased from 50 to 65 tons of ammonia, and the sulphate plant has been extended to deal with the larger output. The plants for the manufacture of anhydrous liquid ammonia, ammonium nitrate and sodium nitrate had begun operating. The construction of the 165-ton unit, which has been delayed by the coal strike, will be completed towards the end of this year.

The company was formed in 1920 to undertake the fixation of atmospheric nitrogen and the manufacture of derivative nitrogen compounds. In 1925, additional funds were made available by the issue of £2,000,000 5% debenture stock, guaranteed under the Trade Facilities Act, the whole of the preference and ordinary shares, with the exception of the directors' holdings, being subscribed for by Brunner Mond and Co., so that the total authorised share and loan capital now amounts to £7,000,000.

SOUTH METROPOLITAN GAS CO.

The ordinary general meeting was held on February 23. Mr. Charles Carpenter, D.Sc., M.Inst.C.E. (the President), in the chair. He said that the results of the year's working were not disappointing, although the past year could not be described as a prosperous one. There were three informing tests of success applicable to any business—first, has it gained in volume; second, has it increased in customers; and third, what has it earned? As regards the first two points, the gas supply to South London is mainly a service based upon necessity rather than of luxury. Although theoretically it ought not therefore to be greatly influenced by enhanced prices, it was a fact that these invariably do check gas consumption, while by falling prices the use of gas is stimulated. As the result of the coal strike the company had to raise its charges during the second half of the year by an average of rather less than 15%. Then, too, there was the restriction in shop lighting. These two circumstances account fully for the fact that there was no

actual increase in the gas sold over the last year. But there was a substantial increase in the number of consumers, and in the quantity of appliances in use. The physical laboratory had been conducting some interesting investigations as to which were the best kinds of energy rays from a therapeutic point of view.

Referring to the two great strikes during the year, the chairman said he had often expressed his regret at the wastefulness arising from having to lay down large stocks of coal to provide against these outbursts of industrial unrest. Not only were large sums expended in re-handling the coal thus purchased, but it never produced such good results. When the strike occurred early last spring it soon became evident that even the provision of nearly 250,000 tons would not see the company through the difficulty, and about 800,000 tons of coal were purchased from America, the remainder of the company's requirements being made up from various parts of Europe. The American coal was very good, its freedom from ash showing the care with which it is mined or cleaned. Its yield of gas and tar was higher than that from our own North country coal, for which it formed an admirable substitute in the circumstances. Their gas consumers therefore obtained right through the strike the fullest value for every therm of gas they paid for. This was not less remarkable when it was remembered that the company had never used, except experimentally many years ago, water-gas as a supplement to their coal gas. They were not prejudiced in this matter, but it did not fit in so well to their conditions, and there was therefore no apparatus installed for its manufacture. They had been criticised in this respect, but they were conveniently placed on the Thames to carry on a good trade in coke with Continental customers, who take the surplus which might otherwise have to be used for gas making. During the stoppage the company was able to assist no less than 31 other gas undertakings with supplies of coke for conversion into gas in carburetted water-gas plants. Referring to ammonia and tar, the former had now fallen so low in value that its contribution to reducing the selling price of gas was exceedingly little. Tar, on the other hand, was "suffering" from a boom in price, resulting from the enormous shrinkage in production, brought about by the shutting down during the strike of the metallurgical coking ovens and the very general substitution of water gas for coal gas. Something of the same kind happened in 1920, when the high prices charged for coal tar resulted in an increased use of imported and artificial bitumen for road-making purposes. The company was not going to be a party again to so unsound a policy, and were quoting prices which would allow of the continued use of tar both for macadamising and briquetting. They depended so much upon their returns from tar that it was their duty to do all that they could to assist the stability of the industries using it, so that their customers might rely upon a constant supply at reasonable prices of the material on which they depend. When the price of pitch or creosote is raised beyond their economic value, every effort is made to replace them by substitutes, to the ultimate disadvantage of the company. Referring to the recent development of their co-partnership scheme, the chairman explained its advantages and said it was a

remarkable fact that, after thirty-six years of co-partnership the employees' desire was to strengthen rather than to loosen the bonds which bound capital and labour together in one united whole. The chairman then referred to the dividend, which it was hoped would have been greater, but the events of 1926 had been too much for them. As it was, £98,000 had been drawn from the fund specially authorised by Parliament to meet such contingencies.

A dividend was declared at the rate of 6% per annum. Mr. A. M. Paddon and Mr. F. McLeod were re-elected directors, and Mr. John H. Fry was elected auditor of the company in place of his brother, Mr. George Fry.

An extraordinary general meeting followed for the purpose of considering and approving an agreement made between the South Metropolitan Gas Company and the South Suburban Gas Company. The resolution was unanimously approved.

BORAX CONSOLIDATED, LTD.

The twenty-ninth ordinary general meeting was held on February 23, the Earl of Leven and Melville (chairman) presiding. He referred to the great loss the company had sustained by the death of Lord Chichester, who was its chairman for 12 years. Although the trading result showed a decrease on that of 1925 (£387,858, compared with £425,111), he thought shareholders would consider it as satisfactory, in view of the very serious depression of business in this country owing to the strikes. During its career, the company had had to meet competition, with which it had been able successfully to contend, owing to the favourable position and character of its properties. The competition which was referred to in the report, appeared to have been conducted on an uneconomic basis, and borax had been offered at prices which the directors had every reason to believe were not justified by the cost of production. They were confident that they would be able to meet this competition. The economical production of their raw material—borate ore and improvements in plant and processes, occupied the constant attention of the company's engineers and chemists, and the Board had reason to believe that recent developments which they had undertaken would show a substantial reduction of costs, and so offset the effect of lower prices for the finished products. The introduction of the new regulations on January 1 last, prohibiting the use of boric acid in practically all food products, would cause the company loss of business to a limited extent. The demand for borax and boric acid for industrial purposes was steadily progressing, and this, helped by the new uses which were being found for them, should soon compensate for any loss of business in this country resulting from the food regulations, and should provide for an enlarged business by the company in the near future. A final dividend was declared of 1s. 3d. per share, making 10% for the year. (For accounts, see CHEM. AND IND., February 18, 1927, p. 153.)

MATHER AND PLATT, LTD.

The report for 1926 shows a net profit of £251,636, against £260,885 for 1925. After placing £40,910 to income-tax reserve (same), the directors recommend maintaining the dividend and bonus at 10% and 5% respectively, free of tax, carrying forward £164,458.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

(Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.)

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
 Bisulphite of Lime—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammonic.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included. Sod. Chlorate.—2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
 Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
 Arsenic, Sulphide, Yellow.—2s. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 2d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 5s. per ton. Good demand. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£7—£10 per ton, according to grade and locality. Quiet.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—1s. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 4s. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P. Both in good demand.
 Wood Tar.—£4—£5 10s. per ton and upwards, according to grade. Better demand.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carbohc.—Crystals, 6d.—6½d. per lb. Crude 60's, 1s. 8d.—2s. per gal.
 Acid Cresylic, 99/100.—2s. 3d.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 3d. per gal. Pale, 95% O.P., 1s. 10d.—2s. 2d. per gal. Dark, 1s. 9d.—2s. 1d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 2½d.—1s. 3½d. per gal., ex works in tank wagons; Standard motor, 1s. 11d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s. 2d.—2s. 6d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 11½d. to 2s. 3d. per gal. Firm. Pure, 2s. 2½d.—3s. per gal.
 Xylol.—2s. 3d.—3s. per gal. Pure, 4s. per gal.
 Creosote.—Cresylic 20/24%.—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal.
 Naphtha.—Crude, 9½d.—1s. 0½d. per gal., according to quality. Solvent 90/160, 2s.—2s. 1d. per gal. Solvent 95/160, 1s. 9d.—1s. 10d. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
 Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—97s. 6d.—120s. per ton, f.o.b. according to district.
 Pyridine.—90/140.—9s. 6d.—13s. per gal. Nominal. 90/180.—7s. 6d. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7d. per lb., naked at works.
 Aniline Salts.—7d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d. per lb.
 m-Cresol 98/100%.—2s. 8½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—7d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 4d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4d.—2s. 5d. per lb. Bulk.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots—1s. per oz.
 Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 3½d.—1s. 4½d. per lb. Less 5%. Better conditions.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4d.—1s. 6d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 1½d. per lb. Less 5%. Firmer market.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—11s. 3d.—11s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.
 Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr. paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 3d.—2s. 4d. per lb. Potassium.—1s. 10d.—1s. 11d. per lb. Sodium.—2s.—2s. 2d. per lb. All spot.
 Calcium Lactate.—1s. 4d.—1s. 5d. per lb.
 Chloral Hydrate.—3s. 2d.—3s. 5d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ether meth.—1s. 1d.—1s. 1½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—6s. 6d.—7s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 5d. per gal. f.o.r. makers' works, naked.
 Hydroquinone.—4s. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—22s. per cwt., 112 lb. lots.
 Magnesium Carbonate.—Light Commercial £33 per ton net.
 Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%, in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. not. Synthetic, 10s. 6d.—12s. per lb., according to quantity; Liquid (95%), 12s. per lb. Detached cryst., 14s. 6d. per lb.
 Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb., Levig. 6s. 1d. per lb.; Corrosive sublimate, Lump, 4s. 8d.—4s. 10d. per lb., Powder, 4s. 11d. per lb.; White precip., Lump, 4s. 10d.—5s. per lb., Powder, 5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d. per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide, 5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d. per lb.; Sulph. nig., 4s. 10d.—4s. 11d. per lb.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonat.—15s.—15s. 3d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—3s. 9d.—4s. per lb.
 Phenazone.—5s. 9d.—6s. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 90s. per cwt., less 2½% for ton lots.
 Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
 Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins.
 Resorcin.—4s. per lb. spot.
 Saccharin.—55s. per lb.
 Salol.—3s.—3s. 3d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—77s. 8d.—85s. per cwt. net, according to quantity.

Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal 1s. 10d.—1s. 11d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.
 Sulphonal.—10s.—10s. 3d. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s.—2s. 1d. per lb.
 Thymol, Puriss.—11s. 3d.—12s. 6d. per lb., according to quantity. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.
 Aubepine (*ex Anethole*).—10s. 3d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.
 Cinnamic Aldehyde.—Natural, 17s. per lb.
 Coumarin.—10s. 9d. per lb.
 Citronellol.—15s. per lb.
 Citral.—9s. 6d. per lb.
 Ethyl Cinnamate.—10s. per lb.
 Ethyl Phthalate.—3s. 3d. per lb.
 Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—19s. per lb.
 Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol—(*ex Shui Oil*) 12s. per lb.—(*ex Bois de Rose*) 16s. per lb.
 Linalyl Acetate.—(*ex Shui Oil*) 14s. 6d. per lb.—(*ex Bois de Rose*) 18s. per lb.
 Methyl Anthranilate.—9s. per lb.
 Methyl Benzozate.—4s. 6d. per lb.
 Musk Ketone.—30s. per lb.
 Musk Xylol.—8s. 6d. per lb.
 Nerolin.—3s. 9d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—11s. per lb.
 Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpincol.—1s. 6d. per lb. Vanillin.—17s.—19s. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—30s. per lb. Bourbon Geranium.—11s. 3d. per lb.
 Camphor.—63s. 6d. per cwt. Cananga, Java, 20s. per lb. Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure.—6s. per lb.
 Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 20s. 9d. per lb. Lemon.—9s. 6d. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb.
 Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 20s. 9d. per lb. Japanese, 8s. 6d. per lb. Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The Complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Apr. 23rd. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Mar. 10th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Baier and Hammer. Grinding-mills. 4208. Feb. 15.
 Capra. Filter press. 4108. Feb. 14.
 Déo. Apparatus for combustion, drying, etc. 4341. Feb. 16. (Fr. 20.2.26.)
 Davis. Dyeing-machines. 4712. Feb. 19.
 Fritsch, Fritsch, and Fritsch & Co. Devices for mixing etc. liquids etc. 4134. Feb. 14.

Gewerkschaft Sachtleben and Klippers. 4641. See X.
 Jeremiassen. Crystallisation apparatus. 4151. Feb. 14.
 Johnson (I.-G. Farbenind.). Continuous evaporation etc. of difficultly distillable liquids. 4484. Feb. 17.
 Osman. Continuous kilns. 4681. Feb. 19.
 Prior, Riley, and Priorsells, Ltd. Apparatus for determining colour and density of liquids. 4273. Feb. 15.
 Scherbaum. Grinding-mill. 4220. Feb. 15. (Ger., 15.2.26.)

I.—Complete Specifications

28,176 (1925). Shaw and Pickard. Filtration. (265,674.)
 28,279 (1925). Metallbank und Metallurgische Ges. Reactivating adsorption media. (242,986.)
 3742 (1926). Marks (Grasselli Chemical Co.). Apparatus for drying and heating. (265,771.)
 15,046 (1926). Nestle & Anglo-Swiss Condensed Milk Co. Atomising and desiccating liquids or solutions. (265,840.)
 17,840 (1926). Fox and Fox. Filters. (265,856.)
 21,714 (1926). Svensson and Norling. Centrifugal treatment of liquids. (264,130.)
 24,360 (1926). Lacore and Piron. Rotary furnaces. (259,238.)
 24,669 (1926). Internat. Gen. Electric Co., Inc. Rotary hearth furnaces. (259,570.)
 *1492 (1927). Artner. Production of platinum contact bodies. (265,938.)
 *4229 (1927). Scherbaum. Grinding-mill. (266,009.)

II.—Applications

Allgem. Ges. f. Chem. Industrie. Continuous treatment of hydrocarbons. 4618. Feb. 18. (Ger., 1.11.26.)
 Asiatic Petroleum Co., and Vincent. Refining mineral lubricating oils. 4628. Feb. 18.
 Croad (Zieley Processes Corp.). Distillation of carbonaceous material. 4036. Feb. 14.
 Déo. 4341. See I.
 Herzberg. Producing gaseous mixture from pulverised coal. 4372. Feb. 16. (Ger., 19.2.26.)
 Lambert. Prevention of fire in gas scrubbers etc. 4251. Feb. 15.

Moeller. Treatment of peat. 4700. Feb. 19.
 Potts (Mineral A.-G. Brig). 4332. See IX.
 Salerni. Distillation of carbonaceous materials. 4499. Feb. 17.
 Still. Recovery of by-products in coke oven etc. plants. 4130. Feb. 14. (Ger., 15.2.26.)
 Travers. Apparatus for low-temperature distillation of coal etc. 4217. Feb. 15.

II.—Complete Specifications

22,657 (1925). Copley. Manufacture of gas. (240,440.)
 29,884 (1925). Wilhelm. Working-up acid resins into neutral bitumens. (254,674.)
 30,610 (1925). Deutsche Erdöl A.-G. Conversion of heavy into lighter hydrocarbons. (244,107.)
 3882 (1926). Chavanne. Gasification of solid fuels. (247,571.)
 14,069 (1926). Bataafsche Petroleum Maatsch., and Brey. Separating a mixture of volatile liquid and gaseous hydrocarbons. (255,428.)
 27,585 (1926). I.-G. Farbenind. Recovering volatile organic substances from gas mixtures. (262,404.)
 *25,298 (1926). Verein f. Chem. Industrie. Producing or reactivating inactive or exhausted active carbon. (265,916.)
 *3887 (1927). N. V. Silica en Ovenbouw Mij. Recovery of benzenes from coal gas. (265,984.)
 *3903 (1927). I.-G. Farbenind. Decomposition of hydrocarbons by means of water vapour. (265,989.)
 *3926 (1927). Nederlandse Mijnbouw en Handel Maatsch. Making a highly-active alkaline coke. (265,993.)
 *4130 (1927). Still. Recovery of by-products in coke-oven or like plants. (266,003.)

III.—Complete Specification

*3887 (1927). N. V. Silica en Ovenbouw Mij. *See* II.

IV.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of azo dye-stuffs. 4402. Feb. 16. Dyestuffs. 4626. Feb. 18.

Haller and Kappeler. Condensation products of aryl-amines. 4478. Feb. 17. (Ger., 24.1.27.)

Johnson (I.-G. Farbenind.). Manufacture of vat dyestuffs. 4073. Feb. 14. Production of ketones of the anthracene series. 4369. Feb. 16.

IV.—Complete Specifications

19,938 (1925). Ransford (Cassella & Co.). Manufacture of aromatic compounds and dyestuffs. (265,641.)

2756 (1926). Carpmael (I.-G. Farbenind.). Manufacture of monazo dyestuffs. (265,787.)

*3559 (1927). I.-G. Farbenind. Manufacture of vat dyestuffs. (265,904.)

*3889 (1927). I.-G. Farbenind. Manufacture of solid diazo-salts. (265,985.)

*3890 (1927). Geigy A.-G. Manufacture of acid dyestuffs of the phenolphthalein series. (265,986.)

V.—Applications

Achille Serre, Ltd., Allott, and Hatfield. Cleaning processes. 4275 and 4277. Feb. 15.

Dux Chemical Solutions Co. Rendering canvas rot and waterproof. 3596. Feb. 18.

Gillis. Degumming flax straw. 4285. Feb. 15

McLaughlin. Preservative for silk etc. fabrics. 4193. Feb. 15.

Soc. Civile des Proc. Masse. Treating stalks of ramie. 4239. Feb. 15. (Fr., 22.2.26.)

V.—Complete Specifications

28,315 (1925). Neumann. Manufacture of viscose solutions. (265,685.)

28,778 (1925). Lynn and Leyst. Production of cellulose material. (265,697.)

*3991 (1927). Vereinigte Glanzstoff Fabr. Treating artificial silk. (265,996.)

VI.—Applications

Oberrheinische Handelsges. Treating yarns etc. 4514. Feb. 17. (Ger., 17.2.26.)

Thies. Mercerisation of piece goods. 4606. Feb. 18.

VI.—Complete Specifications

30,473 (1925). Berg and Imhoff. Weighting of fibres. (265,727.)

12,731 (1926). Schlumpf. Apparatus for dyeing or washing textiles. (253,500.)

VII.—Applications

Barrett and Bonniksen. Manufacture and storage of phosphine. 4246. Feb. 15.

Carpmael (I.-G. Farbenind.). Manufacture of alkali and alkaline earth hydroxides. 4401. Feb. 16.

Coles. Production of caustic soda and silica. 4021. Feb. 14.

Johnson (I.-G. Farbenind.). Manufacture of salts of alkaline-earth metals. 4072. Production of calcium formaldehyde sulphonylate. 4074. Feb. 14. Production, treatment, and storage of hydrogen peroxide. 4368. Feb. 16.

Monsanto Chemical Works. Contact sulphuric acid process. 4153. Feb. 14. (U.S., 15.2.26.)

Sharp (Soc. Gén. Métallurgique de Hoboken). Manufacture of sulphuric acid. 4731-2. Feb. 19.

VII.—Complete Specifications

18,150 (1926). Gallardo y de Sotto. Manufacture of sulphuric acid. (265,857.)

23,947 (1926). Meyerhofer. Producing metal compounds. (265,880.)

30,283 (1926). Laine. Apparatus for the manufacture and delivery of hydrocyanic acid gas. (262,423.)

*4153 (1927). Monsanto Chemical Works. Contact sulphuric acid process. (266,007.)

VIII.—Applications

Fitzgerald. Binding materials for refractory etc. substances. 4069. Feb. 14.

Rainforth. Non-splintering glass. 4082. Feb. 14.

VIII.—Complete Specification

16,022 (1926). Haddon (Corning Glass Works). Refractory articles or castings. (265,847.)

IX.—Applications

Abrey. Manufacture of artificial stone. 4101. Feb. 14.

Aerni. Manufacture of artificial stone. 4509-10. Feb. 17. (Switz., 20.2.26.)

Atthenont. Building material. 4045. Feb. 14 (Fr., 27.7.26.)

Brown. Mixture for construction of cold asphalt pavements. 4524. Feb. 17.

Eckel. Cement. 4110. Feb. 14. (U.S., 31.3.26.)

Gall and Peake. Compositions for making etc. roads. 4215. Feb. 15.

Goodall. Drying, fireproofing, etc. timber. 4701. Feb. 19.

I.-G. Farbenind. Priming wood etc. supports. 4485. Feb. 16. (Ger., 17.2.26.)

Potts (Mineral A.-G. Brig). Artificial asphalt. 4332. Feb. 16. Manufacture of artificial rubber asphalt etc. 4452. Feb. 17.

IX.—Complete Specification

20,571 (1925). Smith and Phipps. Treatment of wood etc. (265,643.)

X.—Applications

Bogdandy and Polanyi. Determining composition of copper and zinc alloys. 4516. Feb. 17. (Ger., 24.3.26.)

Coles. Protection of metallic surfaces from corrosion. 4022. Feb. 14. Protecting iron and steel surfaces from corrosion. 4666. Feb. 19.

Dietzsch. Treatment of ores. 4371. Feb. 16.

Gewerkschaft Saetlehen and Kippers. Rotating muffle furnace. 4641. Feb. 18. (Ger., 24.3.26.)

Jessup. Manufacture of magnesium. 4511. Feb. 17. (Fr., 30.3.26.) Electrolytic production of magnesium etc. 4512. Feb. 17. (U.S. 30.3.26.)

Jones. Galvanising metal sheets. 4322. Feb. 16.

Lucas. Purifying iron scale. 4112. Feb. 14

Neumark. Producing pig iron in blast furnaces. 4373. Feb. 16.

New Jersey Zinc Co. Metallurgical operations. 4262. Feb. 15. (U.S., 25.3.26.)

Siemens und Halske A.-G. Apparatus for electrodeposition of chromium. 4754. Feb. 19. (U.S., 20.2.26.)

Williams. Refining lead bullion. 4529-30. Feb. 17. (Australia, 6.3.26.)

X.—Complete Specifications

31,455 (1925). Preston. Soldering aluminium or its alloys. (265,733.)

12,431 (1926). Dechesne. Cupola furnaces. (265,827.)

12,642 (1926). Appel. Electrolytic separation of chromium. (265,833.)

27,365 (1926). Bořak. Cementation of iron and steel. (260,980.)

*1492 (1927). Artner. *See* I.

XI.—Applications

British Battery Co., and Reynolds. Electric batteries. 4383. Feb. 16.

Campbell, and General Electric Co. Gas-filled photo-electric cells. 4211. Feb. 15.

Jessup. 4512: *See* X.

- Mouillefarine. Dielectric product. 4598. Feb. 18. (Fr., 18.2.26.)
 Siemens und Halske A.-G. 4754. See X.

 Trotter. Electric accumulators. 4690. Feb. 19.
 Williams. Electric accumulators. 4723. Feb. 19.
 Wright. Light-sensitive cells etc. 4096. Feb. 14.

XI.—Complete Specifications

- 28,031 (1925). Field. Electrolytic oxidation of organic compounds. (265,672.)
 12,642 (1925). Appel. See X.
 *26,456 (1926). Hagspiel. Electrodes for electric accumulators. (265,918.)
 *2663 (1927). British Thomson-Houston Co., Ltd. Electric furnaces. (265,950.)
 *3588 (1927). Bayer. Producing porous insulating materials. (265,968.)

XII.—Application

- Achille Serre, Ltd., Alliot, and Hatfield. Manufacture of soaps. 4276. Feb. 15.

XII.—Complete Specification

- 29,559 (1925). Flammer and Kelber. Manufacture of soap. (265,714.)

XIII.—Applications

- Carrier Engineering Co., and Robertson. Varnishes lacquers, etc. 4494. Feb. 17.
 King and Threlfall. Materials for painting etc. 4370. Feb. 16.

XIII. Complete Specification

- 5015 (1926). Chughlan. Ingredient for printing-ink. (265,787.)

XIV.—Applications

- Dicker (Rubber Latex Research Corp.). Production of rubber articles. 4147. Feb. 14.
 Glascoine. Ascertaining hardness of vulcanised industrial rubber etc. 4097. Feb. 14.
 Nyrop. Preparing latex for rubber manufacture. 4282. Feb. 15.
 Potts (Mineral A.-G. Brig). 4452. See IX.
 Silesu. Verein Chem. Fabr. Accelerating vulcanisation. 4643. Feb. 18. (Ger., 4.5.26.)

XIV.—Complete Specifications

- *28,917 (1926). Goodyear Tire and Rubber Co. Vulcanising rubber. (265,920.)
 *32,895 (1926). Grasselli Chemical Co. Vulcanisation of rubber substances. (265,930.)

XV.—Complete Specifications

- 4456 (1926). Deutsche Kunsthorn-Ges. Manufacture of horn-like materials from albuminous substances. (247,955.)
 27,712 (1926). Deutsche Kunsthorn-Ges. Manufacture of artificial horn from albuminous substances. (261,009.)
 *3645 (1927). Massin. Depilating skins and hides. (265,972.)

XVII.—Application

- Carpmael (I.-G. Farbenind.). Manufacture of depolymerisation products from carbohydrates. 4264. Feb. 15.

XVII.—Complete Specification

- 12,607 (1926). Jackson (Larowe Construction Co.). Recovery of substances from residual liquors of the beet-sugar industry. (265,831.)

XVIII.—Applications

- Johnson (Bücher). Production of yeast. 4747. Feb. 19.
 Murphy, and Murphy & Son. Manufacture of beer etc. 4633. Feb. 18.

XIX.—Applications

- Calder. Concentrated fruit products etc. 4706—7. Feb. 19.

XIX.—Complete Specifications

- 16,446 (1926). Stassano. Sterilising or pasteurising putrescible liquids. (254,725.)
 20,201 (1926). Gewalt. Improving the qualities of coffee. (265,865.)
 *10,742 (1926). Hoefelmayr. Manufacture of invalid food from milk. (265,910.)

XX.—Applications

- Chem. Fabr. vorm. Schering. Manufacture of aliphatic auromercapto-carboxylic acids. 4265. Feb. 15. (Ger., 17.2.26.)
 Haller and Kappeler. 4478. See IV.
 I.-G. Farbenind. Production of urea. 4746. Feb. 19. (Ger., 19.2.26.)
 Lilly and Co. Purified pneumococci antitoxin. 4140. Feb. 14. (U.S., 10.2.26.)
 Merck. Antirachitic preparations. 4765. Feb. 19. (Ger., 14.1.27.)

XX.—Complete Specifications

- 28,031 (1925). Field. See XI.
 28,193 (1925). Bourgoin. Acetylation of fatty and other substances. (265,677.)
 4305 (1926). Carpmael (Chem. Fabr. vorm. Schering). Manufacture of organic auromercapto acids and salts thereof. (265,777.)
 18,338 (1926). Roessler and Hasslacher Chemical Co. Production of amide acid sulphates from nitriles. (255,886.)
 *32,897 (1926). Grasselli Chemical Co. Aldehyde amine condensation products. (265,931.)
 *1695 (1927). Hoffmann-La Roche & Co. Manufacture of a glucoside of *Adonis vernalis*, L. (265,941.)
 *2400 (1927). Soc. Franc. de Catalyse Généralisée. Production of methyl alcohol by catalysis. (265,948.)
 *3427 (1927). Riedel A.-G. Producing adipic acid and its substitution products. (265,959.)
 *3430 (1927). I.-G. Farbenind. Manufacture of primary amines. (265,960.)
 *3928 (1927). Komlos, Komlos, and Engelke. Manufacture of compounds of carbon and sulphur. (265,994.)

XXI.—Application

- Trist. Photographic plates. 4532. Feb. 17.

XXI.—Complete Specification

- 3261 (1926). Wade (Wadsworth Watch Case Co.). Photographic processes. (265,769.)

XXIII.—Application

- Adams. Sewage-purification plant. 4314. Feb. 16.

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—
Belgium: Leather (177). *Brazil*: Iron, galvanised sheets (197). *British India*: Iron and steel (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Canada*: Sanitary ware (B.X. 3261). *Egypt*: Hides, soap, palm-oil (Egyptian Government, 41, Tothill Street, London, S.W.1. Refs. Muh. 1926/63/1 and Muh. 1926/65/1, and Ref. C. 2210). *France*: Tinplate, galvanised sheets, iron, steel (178); Leather (179). *Holland*: Iron, steel,

tin (184). *Italy*: Raw materials for the pottery industry (188). *Luxemburg*: Leather (177). *Norway*: Galvanised sheets (189); Chemical and tanning extracts (190). *Rumania*: Flattening varnish, turpentine, siccativ, zinc white, linseed oil, chrome yellow, ultramarine, Paris blue, lamp black, ochre, white petroleum jelly, white starch, glue, orange shellac, paraffin wax, caustic soda, sand-paper (B. 3267). *South Africa*: Steel, cast-iron (A.X. 4281). *United States*: Steel (A.X. 4262).

Vat Colours on Wool

The vogue for pale and bright shades in wool materials has revealed a weakness in colours which have hitherto been considered to be of sufficient fastness. The possibility of using vat colours, which have already obtained a world-wide renown when used on cotton goods, has therefore suggested itself. In consequence, the British Dyestuffs Corporation, Ltd., has recently issued a pattern card illustrating the application of vat colours on wool. These Duranthrene and Caledon colours (anthraquinone vat colours) which can be used on wool are of excellent fastness to light and milling, and are extremely level dyeing. Details are given of the dyeing process employed with these colours. Durnedone colours, which are vat colours of the indigoid type, and as such possess a somewhat better affinity for wool than the anthraquinone brands, are also described. These come more into use for heavier shades. They possess very good all-round fastness, but are not suitable for mixing with Duranthrene or Caledon brands in dyeing.

Valves

A catalogue (No. 100) which has been published recently by J. Blakeborough & Sons, Ltd., Woodhouse Works, Brighouse, Yorks, describes the firm's valves and auxiliaries for steam power plant. The firm makes valves for every service, in any size, material or purpose, and the publication will be of interest to all who require to control the movements of liquids or gases. The catalogue is well illustrated and produced, and conveniently arranged for reference.

LONDON, MARCH 11, 1927

NO. 10

EDITORIAL

Chemistry and the Public

THE British Industries Fair has run its appointed course, and, from all we are able to gather, it seems probable that the Fair has been the most successful yet held. In the Chemical Section, the exhibitors appeared to wear a certain feeling of satisfaction, and although it is yet too early to judge the full effect of the Fair, the news of many important inquiries and orders warrants optimism. Certainly the Chemical Section was most attractive, and though we do not wish to pick or choose where there was so much excellence, special praise was certainly due to Imperial Chemical Industries, Ltd., and their architect for the attractive edifice which they erected to the glory of British chemical industry. As in previous years, the Fair was open to the public in the evenings, and the attendance showed that the man in the street, and particularly his wife, is interested in such displays. Indeed, towards the close of the Fair the attendance of the public seemed—though we may be wrong—to have overflowed into the hours reserved for the serious business which was the main object. To us, as to anyone in the least chemically-minded, the Fair was really a huge demonstration of the prowess of British chemistry. Chemicals there were in the Chemical Section, but their uses under skilled guidance were clear in the other Sections for anyone to see who could. Glassware, pottery in all the beautiful colours of the modern potter, indiarubber articles, moulding products, cleansing materials, foodstuffs, insulating materials in the wireless section, textiles and clothing, all these depend in one way or another on the chemical manufacturer and the chemist. Pity 'tis that the tale has been so little told. Excellent books have been written—witness "Chemistry in the XX Century"—chemists are providing excellent popular articles for the daily newspapers, but the public has still too little grasp of the real significance of chemistry, still less does it comprehend the universal chemical basis of modern civilisation. Exhibitions such as Wembley and the British Industries Fair help, however, very greatly, and we are glad that they combine their undoubted value to industry with a little educational demonstration for the public.

Research in the Woollen Industry

Another method of demonstrating the value of science in modern industry has been employed by the British Research Association for the Woollen and Worsted Industry. Last week Lord Balfour opened an exhibition in the Science Museum, South Kensington, which illustrates how the Research Association has applied science to the study of wool in all its stages from the sheep to the finished fabrics. The long series of cases provides striking evidence of the value of chemical research in the industry. Wool grease, the removal of vegetable matter from wool by carbonising, the structure of the fibres, the absorption of alkali in scouring and its effects, methods for avoiding the trouble caused to the trade by tar, the bleaching of wool, the production of unshrinkable wool by chlorination, a study of the sulphur content of wool and a series of compounds—cystine, tyrosine, glycine, alanine, valine, and so on—obtainable from wool substance: these were some of the exhibits, in addition to specimens showing the action of bacteria on fabrics and the fading of dyes on wool. We have no space to mention all the exhibits, which included some interesting apparatus, but we hope that the exhibition will have many visitors. In opening the exhibition, Lord Balfour said he did not think the public realised that if the nation is to be progressive, this can only be accomplished by the application to industry of science and of the fundamental principles of science, investigated probably with no thought of their commercial application. We were glad to note that Lord Balfour paid a merited tribute to the successful work of the Research Association, and we hope that other Research Associations may find it possible to organise exhibitions to show to the public the unceasing contributions of science to the material well-being of mankind.

Remuneration

Mr. (or Miss) E. M. Hull's novel, "The Sheik," has, we were insistently informed, passed the million mark a year ago. Conrad would have been amazed, or amused, had the total of all his works reached that figure. The first edition of Hardy's "Far from the Madding Crowd" was, except for the forty copies actually sold, disposed of

as a "remainder." But it is only fair to add that more of us have learnt to read since that date, and even we who read neither Hardy nor Conrad will place these, amongst the immortals, higher than our own fancy, Mr. (or Miss) E. M. Hull. Few of us read the Bible, or even Shakespeare, and it is not so many months since we crowded out the boxes and stalls of "No, No, Nanette," what time poor Mr. Ainley played an excellent "Much Ado about Nothing" to shrinking houses. Our great organist composer bewails the lack of support in England for good music; but think of the urgent lithograph machines pouring out hot copies of "Show me the way to go home." The remuneration which these people and many others receive is a rough measure of the "use" the public has for them. Slow-footed posterity may do them justice—but posterity pays no royalties. Now, the British Public has little interest in chemistry (except during a war), and less understanding of it. If you are proposing to join the trade you will find that your kinswomen and acquaintances, when you inform them of it, will casually but vocally expect you in a week or so to be ready to announce your first earth-shaking discovery: but your remuneration will reflect in some degree the light in which our public regards you. Your employers' can interfere greatly neither way. But don't be bitter about it: you are one of the same happy-go-lucky, careless, unbalanced, inappreciative public neglecting and sweating disillusioned artistic and other men in their several crafts, professions and occupations. If you are one of those people for whom happiness can be accurately measured in terms of the exchangeable possessions, you had better avoid the career of research or process chemist, where prizes are rare and part of the wages is earned in terms of satisfaction for a good thing well done. You were better advised to tickle the vanity or palate of the Imperial public, to mesmerise them into buying what they would as soon not buy, or to sell them some nostrum warranted to push back the day when they must quit the world they make unremitting efforts to forget. But since not all of us have facial muscles facile in registering contorted emotions; since not all of us can be manufacturers of sweetmeats any more than we can all become laundresses; and since the might of England cannot be wholly sustained by the efforts of publicity agents, some of us must even be content to become chemists. And when, forgetting that we as individuals are indistinguishable from the rest of the great public, we sigh over the uncertainty of the rewards showered out or doled out, we should remember that our quarrel is not as much with social and economic conditions as with our own blundering choice of parents. Let us, then, adapting Celia's remedy, sit and mock the good housewife Fortune from her wheel, that her gifts may henceforth be bestowed equally.

THE ANNUAL REPORTS, 1926

It is pleasant to turn to the new volume of the Annual Reports of the Progress of Applied Chemistry for 1926, which has just been published, and find that research has been no less active during the past year, and that

steady progress has been made in various branches of industry, despite the industrial depression.

In the section dealing with "Plant and Machinery," Mr. S. G. M. Ure records a welcome resumption of orders in the engineering industry, and has many new developments to record in the production of chemical plant. The scientific utilisation of fuel assumes ever-greater importance, and in "Fuel," Mr. H. J. Hodsman provides an interesting discussion of the large mass of work relating to the use and treatment of coal. "Gas, Destructive Distillation, and Tar Products" are dealt with by Dr. J. G. King and Mr. R. A. A. Taylor, and much new work is considered in relation to carbonisation, gas purification, combustion, calorimetry, and so on. Dr. A. E. Dunstan has contributed the account of the work on "Mineral Oils," and records some important advances in the chemistry of petroleum distillates.

Mr. C. Hollins, in "Colouring Matters and Dyes," points to a brighter outlook for the industry, and in discussing intermediates shows the growing interest of the dyemaker in synthetic alcohols and other aliphatic compounds. Developments in the production of benzene derivatives are commented upon and the copious publications relating to dyes are treated systematically. "Fibres, Textiles, Cellulose, and Paper" are dealt with by Mr. D. J. Norman, who has many interesting studies on textile fibres to consider, particularly in relation to the problems presented by cellulose silks. Mr. A. J. Hall, in "Bleaching, Dyeing, Printing, and Finishing," considers that little of outstanding importance can be recorded in the industries covered by his report. Work on the treatment of textile fibres has been active, however, and is fully discussed.

Messrs. P. Parrish and F. C. Snelling, in "Acids, Alkalis, Salts, etc.," discuss the nitrogen industry in its various aspects, and record, amongst other subjects, the difficulties of the sulphuric acid and superphosphate industries. The report on "Glass" is due to Mr. A. Cousen, who finds that, although the volume of work on glass technology has not decreased, advance has been somewhat unequal in its various branches. Problems dealt with have been mainly on the practical side, such as the melting and durability of glass, and these are considered fully. A similar tendency to deal with the more practical problems is traceable in the report on "Refractories, Ceramics, and Cement," by Mr. A. T. Green. The properties of clays continue to attract attention, and there has been much work on the spalling, erosion, testing, etc. of refractories, whilst the important subject of kilns and kiln-firing receives consideration.

From the report on "Iron and Steel," by Prof. C. O. Bannister, it appears that the industry has been mainly concerned with problems of fuel economy, cementation and case hardening, though more attention is being given to physico-chemical investigations both on a laboratory and an industrial scale. An ever-increasing application of scientific methods is revealed in the report on "Non-ferrous Metals," by Mr. H. F. Richards, who discusses the many problems relating to non-ferrous alloys. In the "Electrochemical and Electrometallurgical Industries," Mr. A. G. Lobley finds steady progress in nearly all branches, and increasing application of electrolytic and electrothermal methods in industry.

Mr. H. M. Langton records unfavourable economic conditions in the industries covered by "Oils, Fats, and Waxes," but reports interesting work on fatty oils, and remarks on the steady progress made in understanding the technique of soap boiling. Members of the Oil and Colour Chemists' Association have provided the report on "Paints, Pigments, Varnishes, and Resins," which covers a vast amount of work, Mr. A. A. Drummond dealing with drying oils, varnishes and driers, Mr. J. A. F. Wilkinson with cellulose ester varnishes and enamels, and Mr. J. Parrish with pigments and paints.

In the section on "India-rubber," Mr. R. W. Lunn notes that the problem of the mechanical structure of rubber is gradually yielding to new methods of examination, and discusses work on latex, the constitution and testing of rubber, and so on.

Mr. D. Woodroffe, in "Leather and Glue," reports that employment in the leather industry has increased slightly, and gives a full discussion of work on tanning and tanning materials, and cognate subjects.

The report on "Soils and Fertilisers" is contributed by Mr. H. J. Page, who has much to record about the situation of the fertiliser industry and the investigation of soil problems.

Messrs. L. Eynon and J. H. Lane, in "Sugars, Starches, and Gums," deal with both the cane and the beet sugar industries, and record some interesting work on miscellaneous sugar products and starches. Mr. H. Lloyd Hind deals exhaustively with the progress in

"The Fermentation Industries," and includes a section on starch and its conversion products. Vitamins and nutrition loom large in the report on "Foods" by Mr. F. S. Aumonier, who also treats of dairy, cereal, fruit and vegetable products, preservatives, and the analysis of foods.

In "Sanitation and Water Purification," Mr. J. Haworth records more work on the activated sludge process for sewage disposal, and contributes a section on trade wastes which is of wide interest.

Important progress is recorded by Messrs. W. H. Gray and H. Paget in their report on "Fine Chemicals, Medicinal Substances, and Essential Oils." The synthesis of thyroxin, insulin-like substances, carbohydrate metabolism, alkaloids, antiseptics, are amongst the subjects treated. The work on "Photographic Materials and Processes" is summarised by Dr. W. Clark, who records steady, but not sensational, progress.

The final report, on "Explosives," is by Dr. J. Weir, who discusses the work done during the last two years. Advances in the use of lead azide as an initiator and in the use of low-freezing explosives for civil work, and the small progress made by liquid oxygen explosives are recorded.

As in previous years, the various reports complete each other, and outstanding questions, such as particle size, cellulose varnishes and silks, synthetic fuels, nitrogen fixation, and many more, are treated from different points of view by different authors. The volume of work in every direction is steadily increasing, and the Annual Reports of the Progress of Applied Chemistry become each year still more essential to those who wish not only to judge of the progress made in a particular industry, but realise the importance of studying the methods employed in other industries.

FERROUS METALLURGY AND CORROSION

It need hardly be pointed out that to all industries which utilise metals an advance in our metallurgical knowledge often constitutes a real and important advantage. In particular, the advantage of obtaining vessels and appliances of metals which, in addition to being strong, ductile and readily worked, possess high resistance to the attack of corrosive media, will not require emphasis to chemical engineers. The modern tendency in many industrial processes to push up, for reasons of efficiency and economy, the working temperature and pressure places a further exacting demand on the properties of the metals used in plant construction. Whilst it cannot be claimed that our knowledge and ability to produce metals suitable for resisting corrosive conditions under high temperature and stress are far advanced, much valuable data are beginning to take form, and certain of the recently developed steels and ferrous alloys show considerable promise, which may result in improvements in chemical processes and even the application of new principles.

It has long been known that high silicon iron alloys containing about 14 to 18% of silicon show high resistance to the corrosive action of various acids; for example, citric, acetic, sulphuric, nitric and hydrochloric acids, and mine waters. These alloys are, however, hard and brittle, and cannot be machined. Attempts have been made to render these alloys tougher and more readily worked by the addition of small percentages of copper or other ductile metal, but with doubtful success. The addition of 2½% of nickel is said to increase the resistance to nitric acid. Certain practical difficulties are also encountered with castings, so that plane surfaces and rectangular shapes are avoided, and as a general rule these alloys are not recommended for high temperature work owing to their liability to warp and crack.

Although the action of chromium in attributing incorrodible properties to steel has been at least suspected for a long time (it will be remembered that Faraday included it among the additions to iron in his experiments to discover an untarnishable metallic mirror), its value and possibilities in this connexion were comparatively unexplored twenty years ago. Since that time, however, a considerable part of metallurgical progress has been connected with this element. To call it the master element of this century may be an overstatement, but its use will undoubtedly increase as the properties of the newer high chromium and nickel-chromium steels become more widely appreciated and enter more extensively into practice.

It is interesting to note that chromium plating can now be successfully accomplished and is resistant to a number of corrosive influences. The process may be carried out by heating the steel in a mixture of alumina and powdered chromium in nearly equal proportions to a temperature of 1300 to 1400° C. *in vacuo*, or a neutral atmosphere. The depth of penetration of the chromium amounts to about 0.18 mm. in 3 hrs. and 0.34 mm. in 6 hrs. As is well known, however, coatings and platings have certain disadvantages of their own; for example, if they crack or flake the subjacent material is attacked, and there is also a tendency at high temperatures for the surface layer to diffuse into the body of the material.

Prior to the war, the anti-corrosive and high-temperature properties of certain chromium steels were already attracting attention. The steel containing 12 to 14% chromium with about 0.3% carbon achieved popular favour on account of its application to cutlery. Its non-scaling properties were found to be satisfactory up to about 850° C. Whilst possessing good mechanical properties, this steel needs to be put into a suitable hard condition and possess a polished surface to develop its anti-corrosive properties to the full. In addition to resisting ordinary weathering, it is not attacked by many food acids, cold nitric acid (1.20 S.G.), and glacial acetic acid, vinegar, lemon juice, oleic and stearic acids, acid copper sulphate solution, caustic alkalis and ammonia, and is being used in soap and sugar works. On the other hand, it is even inferior to carbon steel as regards its resistance to sulphuric and hydrochloric acids. In certain applications this steel has not given the complete satisfaction that there was reason to expect; for example, valve spindles and pump rods are sometimes found to wear in contact with damp packing containing asbestos, graphite, etc., but it has a useful, if somewhat limited, sphere from the point of view of the chemical engineer. Up to a point it is resistant to superheated steam, and is used for turbine blades and steam valves.

Something of an advance was made when a chromium iron alloy of about the same chromium content was introduced—partly due to a low carbon ferro-chrome being placed on the market and partly to improvements in steel manufacturing processes—as generally speaking the lower the carbon content the better the resistance to corrosion. This rustless iron does not air-harden, and heat treatment and surface condition do not have as important a bearing on its corrosion resistance. Moreover, it is more readily rolled, drawn and pressed.

Further work showed that anti-corrosive properties were improved as the chromium content was increased to 17 or 18%, the material becoming immune to electrolytic corrosion when in contact with brass or other dissimilar metal. These steels are, however, martensitic, have a coarse crystalline structure, and are brittle under shock. They are unworkable and unmachinable, but their physical properties are improved by the addition of 2 or 3% of nickel, and then they can be hardened and possess a high yield point ratio.

Chromium-iron alloys of even higher chromium content have valuable heat-resisting and anti-corrosive properties. A type which is meeting with industrial application contains 25 to 30% of chromium and 0.1 to 3.0% carbon. Naturally these alloys are mainly used as castings, but it is claimed that they are machinable with 1% or even 1.5% carbon.

Tests on an alloy containing 29% of chromium showed that it was not oxidised up to 1150° C., not attacked in a reducing atmosphere up to 1100° C., and unattacked in sulphurous gases up to 1000° C., but at higher temperatures the alloy deteriorated along the grain boundaries. It is resistant to sea water, mine waters, and some acids. In America this type of alloy steel has been used as moulds for centrifugal castings. It has been suggested as a suitable material for the construction of plant for low-temperature carbonisation of fuel, but is at least equalled in resistance to oxidation and even surpassed

in retention of strength at high temperatures by some of the nickel-chromium steels described below.

Fig. 1 shows diagrammatically the increase in resistance, in this case to oxidation, with chromium content. An interesting metallurgical point is that above 14% chromium, at which a sudden increase in resistance occurs, the α - γ iron transformation is suppressed, α and δ iron being continuous and identical. Raising the chromium content to 20% increases the resistance to salt water as well as oxidation. To resist nitric acid the chromium must be over 10%, for salt solution over 15%, and for moist sodium chloride over 20%. The addition of a small percentage of copper is said to improve the resistance of these high chromium steels to corrosion. Silicon and manganese are sometimes added to improve

FIG. 1.

the physical properties and ease of working and welding. Steels containing over 20% chromium have been used for sulphide roasting furnace parts, stills, retorts, nitric acid plant and mine pumps.

Before leaving alloy steels with a preponderating percentage of chromium, reference may be made to the influence of silicon additions, which are claimed to increase the resistance to oxidation and certain corrosive media. In America, partly on account of their ease of working, steels of this type have been used for the construction of plant in explosive works for the manufacture and storage of nitric acid. Castings are also said to show good non-corroding properties. From another source chromium-molybdenum steels are stated to be comparatively immune to attack by mineral acids.

Although the Chinese, centuries ago, used an alloy containing nickel which resisted corrosion well, and it has been known for some time that the addition of nickel to steel tended to increase its resistance to sulphuric

and even hydrochloric acid, also that with increasing chromium content steel was rendered more immune to nitric acid, the development of incorrodible steels of the nickel-chromium group is among the latest achievements of ferrous metallurgy. This class of alloy steels, which seems the most promising for extreme cases of high temperature use under oxidising and corrosive conditions, is usually austenitic in structure, and to this extent completely reverses the normal conception of steel behaviour. These steels contain a relatively high content of both nickel and chromium to which is sometimes added a smaller percentage of tungsten, silicon, copper, aluminium or molybdenum or several of these elements. Far from being a simple type they comprise a wide group, with constitutions which may be as complex as modern high-speed steels, which has not yet been fully explored, and on which a good deal of research still remains to be performed before the best alloy for each highly specialised application will be found. Sufficient has been done, however, to show that they open up new and wide possibilities.

On the theoretical side little is known yet about the inter-relation of chemical resistivity and structural constitution. Practice has run ahead of theory. The resistance of chromium and nickel-chromium steels to corroding influences is thought, however, to be due to their low solution pressures and the formation of inert protective coatings, even if only a thin film, by the products of the corroding action itself, which effectively prevents further corrosion. In this connexion some metallurgists advise the use of a pickling solution which forms a resistant oxide coating.

A distinguished metallurgist, writing recently on these steels, divided them into two groups, viz., high nickel-low chromium, and high chromium-low nickel steels, but the range of composition appears to be very wide, i.e., from 7 to 35% chromium, 2 to 60% nickel, and 75 to 25% of iron. From the first group, steels are said to have been developed which are resistant to sulphuric acid, hydrochloric acid and many salts. Recently published German results indicate that an advantage is derived in this connexion by the addition of a few per cent. of molybdenum, as this element is very resistant to both sulphuric and hydrochloric acids. The second group is particularly immune to nitric acid, sea water and contaminated atmospheres. It seems advisable to add a third group to the above classification, viz., steels relatively high in both nickel and chromium. This type, in fact, gives more general resistance to oxidation and chemical attack at high temperatures. In practice, the type most suitable to a particular use is often a matter of trial, and in this connexion the additional elements referred to above may be employed to obtain the beneficial quality desired.

Faced with a choice of one of these steels the chemical engineer will give first consideration to the purpose in view, i.e., the liquor or material to be handled. After this the ease of manufacture or working up into the desired plant will necessitate careful attention. It is interesting to know, therefore, exactly what can be done with the nickel-chromium type of corrosion-resisting steels. Experience shows that they can be forged, hot rolled and pressed, cold pressed and drawn,

riveted, soldered, brazed and cast into fairly intricate shapes, though a high order of technique is required. Difficulties of welding have been overcome, and ductile incorrodible welds can now be produced by the electric arc and oxy-acetylene processes. The austenitic type of steels, however, harden up under cold work which from a construction point of view is not an advantage. They also have rather low proportional limits and yield points at about 50% of the breaking loads. The nickel-chromium non-corroding steels are not dependent on surface finish for their properties. It has, however, been advised in some quarters to retain a polished surface under the most severe conditions.

Whilst it would neither be practicable nor desirable to give a list of the reagents to which the nickel-chromium group of steels has been found resistant—as such lists can be found in the literature of the various makers—it may be of interest to note a few of the industries in which they are either in service or in which they should be of value. It may be anticipated that, at least in some directions, these non-corroding steels will replace non-metallic materials which suffer from fragility, such as porcelain, pottery, and silica, in the construction of chemical plant, and also certain non-ferrous metals on the grounds of greater strength and resistance to heat.

It must be remembered, however, that if a chemical engineer uses a metal he usually requires it to be completely immune, and not merely capable of a high degree of resistance. In some cases it is not so much a question of the corrosive medium not attacking the container as of the container not contaminating the medium, and so spoiling its colour or some other quality. This may account for some slowness in the introduction of the new steels which from the above point of view need to be tested over long periods, so that some of them have hardly yet emerged from the experimental stage.

Immunity to nitric acid, whether hot or cold, of some nickel-chromium steels can be relied on, and their use has been suggested for towers and storage tanks, outlet pipes for stills, condensers, etc. Steel wagons and barrels for the conveyance of nitric acid may be expected in commission in the near future. Vessels of these steels have also been used for the nitration of cellulose by mixed acids. They resist cold sulphuric acid up to a concentration of about 20% and are immune to boiling sulphurous acid, so that they are not attacked by paper pulp liquors. They may be used for acid-mixing tanks and pipe lines and as evaporators for citric and tartaric acids. They resist oleic, oxalic and fatty acids, and also acetic acid, so may be used for vinegar brewery plant.

These steels have given satisfactory service as impellers in rotary pumps, pump rods and cylinder linings, in handling a number of media, including mine waters containing ferrous and ferric salts, and acid solutions. They are also suitable for impeller blades of fans handling corrosive gases, such as the exhaust from pickling rooms. Nickel-chromium steels of the type under consideration are not attacked by caustic alkalis or ammonia and its salts. They successfully withstand bleach liquors, and are suitable for the construction of laundry machinery, for dyeing vats and machinery, and for pumps in dye works and the woollen industry.

On account of the resistance of these steels to food acids they are specially suitable for containers in the food-preparing industries. It has been reported by a Swedish investigator that quantities of copper, tin, nickel, aluminium and enamelware pass into solution with food, whilst rustless iron tested by the same methods showed no metal at all passing into solution. In industries such as flour milling, cocoa, chocolate, margarine, sugar and confectionery making, the new steels should be of utility in various processes. These incorrodible steels are suitable for brewing plant and accessories, yeast churns, etc. Their use is recommended in the milk and dairy industry and for sterilisers, also plant used in the manufacture of pickles and preserves, fruit juices, and so on.

Obviously, all the possible applications of these new alloy steels, or even those which have already been investigated, cannot be dealt with here, but as regards those involving high-temperature conditions, the following may be sufficient to indicate their scope. They are resistant to molten lead, brass and other metals, but complete immunity to molten aluminium still appears to offer some difficulty. They have proved to be the best materials to resist the effect of superheated steam either from the corrosion or erosion point of view, so that their increasing use in this direction, in view of the modern tendency towards the use of higher temperatures and pressures, is to be expected. There is also promise that from among them will emerge a material which will make the gas turbine a practical success.

They should prove of service in gas works, not only for furnace and other parts subjected to heat, but for by-product operations, such as for drying ammonium sulphate. These steels might also be used for the construction of retorts for the medium-temperature carbonisation of coal, and it is not without the bounds of possibility that they will be developed to be of service in ordinary high-temperature coking operations. Steels from among these types are also satisfactory in use for tar heaters, stills, and dehydrators. They are, moreover, coming into use in the oil and petroleum industries. On account of their resistance to sulphur and sulphurous gases, they are being applied to mechanical roasting furnaces handling pyrites and other sulphide ores.

It is well known that the effect of chemical action on metals is intensified by high temperature. The immunity of these steels, at least as regards some of the mineral acids, has been found to fall off rapidly with increase in temperature. Probably the severest conditions to which metals can be subjected is exposure to high temperature, stress, and corrosive action at the same time. Prolonged exposure to heat has a deleterious effect on the structure of ordinary steel, which may be accelerated by corrosive influences, so that if the steel does not fail by gradual movement or flow under stress, inter-crystalline cracking may occur. The class of special steels under consideration shows promise, however, of meeting even these exacting conditions, and is said to be used in the production of synthetic ammonia, in which a mixture of nitrogen and hydrogen is subjected in the presence of a suitable catalyst to high temperature and pressure, stated to be 600° C. and 200 atmospheres for the Haber process and 550° C. and 900 atmospheres

for the Claude process. Certain of these steels are also suitable for low-temperature work, as they do not become brittle in liquid air.

It may be concluded that the full possibilities resulting from the adoption of incorrodible steels do not yet seem to be appreciated, but the development of these ferrous alloys in chemical use and practice will be very interesting to watch.

CANADIAN INDUSTRIAL NOTES

The estimated profits of the Consolidated Mining and Smelting Co. for 1926, after deductions made for depletion, depreciation, contingent account, taxes and \$2,274,771.66 for additions to properties through profit and loss, were \$8,615,735.64. Profits, computed in the same way, for 1925 were \$6,219,843.14.

The annual financial statement of the Dominion Glass Co., Ltd., for the fiscal year ended September 30, 1926, shows net profits of the year, after deductions for interest charges, depreciation, etc., amounting to \$661,586.00 compared with \$607,037 for 1925. After deduction of bond interest, \$170,000, and preferred dividends amounting to \$182,000, there was left a balance of \$309,586 applicable to common dividends; this is equivalent to 7.28% on the \$4,250,000 common stock outstanding, as compared with 6.0% in 1925, and 9.44% in 1924. Common dividends absorbed \$297,500, leaving a surplus of \$12,086. The profit and loss balance now stands at \$1,078,342.

The Hiram Walker distillery at Walkerville, Ontario, has been acquired by interests connected with the Gooderham & Worts Distillery Co., Toronto. The price paid for all rights and property is stated to be \$15,000,000.

The Distillers Co., Ltd., has formed a Canadian subsidiary company which has now been registered. The provisional directorate consists chiefly of well-known residents of Great Britain interested in distillery products. The intended activities of the new company have not been announced to the public.

The Canadian Celanese, Ltd., at Drummondville, Quebec, expects to start the weaving department in a few weeks, but the spinning department will not be prepared to operate until some time later. Meanwhile, the yarns will be obtained from the British and American plants of the associated companies. The initial output of the new Canadian plant, of one ton a day, will not be able, it is believed, to meet the demand.

Canada is fast building up a profitable foreign trade. Since 1922 the sales to foreign countries, other than the United States and Great Britain, have increased from \$77,000,000 in 1922 to \$149,000,000 in 1926. The imports from these same foreign countries, for the same periods, have increased from \$45,000,000 to \$61,000,000. Chemical and allied products form a considerable part of the general export trade of Canada.

The rated daily output of the Canadian newsprint mills for 1927 is expected to be 8,500 tons, compared with 7,500 tons in 1926 and 4,750 tons at the close of 1924. The newsprint output for 1927 is expected to exceed 2,000,000 tons, thus placing Canada in the premier position as a producer.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

BRITISH CHEMICAL ABSTRACTS INDEX, 1926

In accordance with intimation previously made, the Index to the Abstracts for 1926 will cover both Pure and Applied Chemistry. Members of the Society of Chemical Industry who are also Fellows of the Chemical Society will receive only one copy of the combined Index.

The Index is in active preparation, and will be issued as soon as possible.

DEATHS

Crossley, Arthur W., C.M.G., C.B.E., F.R.S. (elected 1894), of Thorngrove, Alderley Edge, Cheshire, Director of the British Cotton Industry Research Association. On March 5, 1927.

Liebmann, Dr. A. (original member), of The Whim, Weybridge, Surrey, Consulting Chemist. In February, 1927.

Newlands, W. P. R. (original member), of 10, Cricklade Avenue, Streatham Hill, London, S.W., Sugar Chemist. On November 3, 1926.

Remsen, Ira, M.D., Ph.D. (elected 1903), of Johns Hopkins University, Baltimore, Maryland, U.S.A., Emeritus Professor of Chemistry and President of the University, President (1909-10) of the Society of Chemical Industry.

Whowell, Fred (elected 1884), of Croich Hey, Tottington, Bury, Lancs., Bleacher. On January 5, 1927.

Yoshitake, Einoshin (elected 1900), of Nishihara-Machi, Koishikawa, Tokyo, Japan, Chemist. On January 2, 1927.

BRISTOL SECTION

The annual meeting of the Bristol Section of the Society of Chemical Industry was held on March 3 at the University of Bristol, when Mr. George Gray (chairman) presided. Mr. J. Bernard was elected as chairman for the ensuing year. Professor F. E. Francis was re-elected vice-chairman, Mr. M. W. Jones was reappointed as hon. treasurer, and Mr. Marsden was re-elected hon. secretary. The committee was reappointed, Mr. Gray filling the vacancy caused by the elevation to the chair of Mr. Bernard.

Mr. Gray then read a paper on "Science and industry." He said that science might be defined as "systematised knowledge," and industry might be defined as "the steady application to any business or pursuit." He believed that in the future it was only the industry built on the more scientific foundation that would continue to prosper. Others would be swallowed up by the competition which their apathy was certain to attract. Industry was full of opportunities for the use of analysis and synthesis. Like any concrete science it could only be based on measurement, whilst the powers of deduction inherent in the well-trained chemist found immeasurable scope in its midst.

Up to the present the chemist had shown too little appreciation of the value of his scientific training in formulating methods of control in industry. Matters had been left either in the hands of the accountant, who must necessarily base his scheme on accountancy methods, unless he was given the help and co-operation of the chemist. The man with the capacity for pure research was rare, although it would appear that, given the en-

couragement and the opportunity, the supply of workers might exceed the demand.² He was quite sure it was the duty of industry to associate itself more closely with pure research work, and whilst results could not be expected to provide an immediate commercial return, they must undoubtedly provide an insurance for the future, yielding a high return to industry in years to come.

MANCHESTER AND LIVERPOOL SECTIONS

The joint meeting of the Manchester and Liverpool Sections of the Society of Chemical Industry was held at the Textile Institute, Manchester, on March 4, Mr. L. Guy Radcliffe, the chairman of the Manchester Section, presiding. The meeting was preceded by a visit to the Shirley Institute, Didsbury, Manchester, by the courtesy of the British Cotton Industry Research Association, after which there was a dinner at the Manchester Limited Restaurant. A paper entitled "Chemical control in the cotton bleaching industry" was read by Dr. Clibbens, B.Sc.

Dr. Clibbens discussed the sub-divisions of academic science, and said that in applied science, or technology, these divisions had certain disadvantages. It was usually the task of the industrial chemist to sift the experiences and observations of an industry, to fit them into a scientific framework, and to convert an applied art into an applied science. In this sense the industrial chemist was very often a Jack of all the scientific trades—chemist, physicist, engineer, microscopist, and so on. Among the purer scientists there were still some who ignored, or who almost resented, the existence of problems which could not be interpreted solely in terms of their own field of specialised knowledge; but the industrial chemist, Jack-of-all-trades though he might be, certainly possessed the larger share of the true scientific spirit. It might be, in the course of time, that our teaching institutions would realise that a very special and highly qualified training was necessary to fit a man for a technical career. It might be that our Industrial Research Institutions would realise that a university pattern of research organisation was the very least adapted to the purpose, and might well result in failure. This was a point of view which would be appreciated by every working chemist who was engaged in the cotton industry.

The simplest conception of cotton bleaching was of a process designed to produce pure white material from originally brown or grey raw cotton; actually the process was something very much more intricate and delicate. The practical aims of the bleaching industry were, first of all, the production of pure white cotton which was permanently white in all the conditions under which cotton was stored, and, further, to do this without sacrificing any of its other textile qualities. Secondly, it was to produce material in the very best condition for subsequent processing, *i.e.*, printing, dyeing and finishing. For example, the material must exhibit perfectly definite and predictable behaviour towards all classes of dyestuffs, a condition only fulfilled by efficiently bleached cotton, or, again, the material must wet rapidly and uniformly. To understand the importance of this property, it was only necessary to consider those finishing processes akin to parchmentisation designed to

produce a stiff linen-like feel in cotton. In these processes cotton was treated with concentrated sulphuric acid solutions. It lay within the nature of things that the duration of such treatment must be measured in seconds only. During a very short time the cotton must wet perfectly with a viscous liquid; any wetting failure would result in local soft patches and would ruin the finish. Thirdly, the finishing qualities were very much influenced by the nature of the bleaching process.

Before any complete system of bleaching control could be established, it was necessary to isolate every factor which affected the attainment of these objects, and quantitatively to specify its effect. This consideration set the proper lines for industrial research into the process. Work along these lines very soon conveyed the conviction of the impossibility of defining the practical aims of bleaching in purely chemical terms. Variations in the structure of a material affected the textile qualities to at least as great an extent as did variations through chemical composition.

Raw cotton freed from mechanical impurities contained, apart from its natural moisture content, 90 to 95% of cellulose and 5 to 10% of substances other than cellulose. The effect of bleaching was to produce a progressive purification of the cellulose, in the sense that it eliminated from the cotton substances other than cellulose. Bleaching invariably produced a chemical change, however slight, in the properties of the cellulose itself, and different bleaching processes differed in the extent of this chemical modification of the cellulose.

Turning to the oxidising agents, Dr. Clibbens stated that normal pure cotton possessed little or no reducing action under ordinary circumstances. Cotton which had been treated with hypochlorites exhibited, however, to a greater or less extent pronounced reducing action, depending upon the conditions of the treatment. This enhanced reducing power could nearly always be detected in commercially bleached cotton. In the same way, treatment of cotton with hypochlorites might increase the acidic properties of the cotton. These changes of increased reducing power and acidity had been ascribed to the formation of a primary oxidation product of cellulose to which the name oxy-cellulose had been given, but the term was simply an academic cloak of ignorance. It was highly probable that the reducing power and the acidic properties of oxydised cotton were due to a complicated mixture of high physical and chemical complexity.

OTTAWA SECTION

There was a good attendance at the meeting held on February 17, presided over by Mr. A. E. MacRae. Dr. L. F. Goodwin spoke, his subject being "On the chemistry of lignin."

It was pointed out that this title did not signify a lecture on the constitution of lignin, but rather a review of the evidence of what constituents have been shown to exist in the molecule as well as those which are probably there. Lignin may be defined as that which is removed from wood when this is cooked with sulphite, etc. Most investigations of lignin have been performed on what at the best cannot be considered a pure, unchanged substance owing to the far from mild methods employed to remove cellulose. Empirical

formulae proposed for lignin are quite complex, and are based mainly on results of analyses of a substance of doubtful primary purity; also for these bodies of high molecular weight analytical results will fit many different figures. Methoxy, acetyl and hydroxyl groups are certainly present in the molecule, and among the debatable questions are the presence of aldehyde, ketone (or carbonyl) groups, and an ethylene linkage. Attempts have been made to sulphonate lignin and purify the ligninsulphonic acid; this proves difficult from the colloidal nature of the product. Klason obtained a crystalline salt with β -naphthylamine and demonstrated two different acids corresponding to what are generally termed α - and β -lignins.

Dr. A. E. Macintyre, in the ensuing discussion, suggested that it is of interest to consider how lignin is formed in nature. He thought that probably the glucoside coniferin in the cambial sap hydrolysed to coniferyl alcohol, which was successively modified to vanillin and proto-catechuic aldehyde, the necessary methylating agent being the formaldehyde always present in plants.

CALENDAR OF FORTHCOMING EVENTS

- Mar. 11. INSTITUTE OF CHEMISTRY, 30, Russell Square, London, W.C.1, at 8 p.m. "The growth of the profession of chemistry during the past half-century," by A. Chaston Chapman.
- Mar. 14. INSTITUTE OF CHEMISTRY, *Leeds Area Local Section*. "The chemist in the food industry," by B. G. McLellan. (*Postponed from Feb. 14.*)
- Mar. 14. INSTITUTE OF BREWING, *London Section*. Engineer's Club, Coventry Street, Piccadilly, W.1, at 8 p.m. "A review of the Institute of Brewing Research," by H. Lloyd Hind. (*Not on Mar. 8 as previously announced.*)
- Mar. 14. INSTITUTION OF THE RUBBER INDUSTRY, *London Section*. Engineers' Club, Piccadilly, W.1, at 8 p.m. "Rubber pigments from the point of view of the manufacturer," by C. A. Klein.
- Mar. 14. INSTITUTE OF METALS, *Scottish Local Section*, 39, Elmbank Crescent, Glasgow, at 7.30 p.m. Annual General Meeting. "Moulding sands," by G. W. Tytoll.
- Mar. 14. ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2, at 8 p.m. (Cantor Lecture) "Some industrial applications of electrothermics," by G. I. Finch. (*Also on Mar. 21 and 28.*)
- Mar. 15. HULL CHEMICAL AND ENGINEERING SOCIETY, Hull Photographic Society's Rooms, Grey Street, Park Street, Hull, at 7.45 p.m. "Hydro-electric power in the Argentine," by H. Peek.
- Mar. 16. SOCIETY OF CHEMICAL INDUSTRY, *South Wales Section*. Technical College, Mount Pleasant, Swansea, at 7.30 p.m. "Further notes on pure chemicals," by E. A. Tyler.
- Mar. 16. SOCIETY OF CHEMICAL INDUSTRY, *Liverpool Section*. Annual Section Meeting. The University, Liverpool, at 6 p.m., to be followed by a joint meeting with the Liverpool and North-Western Section of the Institute of Chemistry. "Bio-chemical aspects of the nature of life," by Prof. J. C. Drummond. (*Not on the 18th.*)

- Mar. 16. **ELECTROPLATERS' AND DEPOSITORS' TECHNICAL SOCIETY**, Northampton Polytechnic Institute, St. John Street, Clerkenwell, London, E.C.1, at 8.15 p.m. Discussion on "Electrodeposition of alloys."
- Mar. 16 **SOCIETY OF GLASS TECHNOLOGY**. Meeting in Birmingham.
- Mar. 16. **INSTITUTE OF CHEMISTRY**. *London Section*. 30, Russell Square, W.C.1, at 8 p.m.
- Mar. 17. **INSTITUTE OF METALS**, *London Local Section*. Rooms of the Society of Motor Manufacturers and Traders, Ltd., 83, Pall Mall, London, S.W.1, at 7.30 p.m. "The works' chemist," by C. E. Barts.
- Mar. 17. **INSTITUTE OF BREWING**, *North of England Section*. Midland Hotel, Manchester. "Notes on bacterial infection of beers, and a special case," by C. G. Matthews and G. C. Matthews.
- Mar. 17. **CHEMICAL SOCIETY**, Burlington House, Piccadilly, W.1, at 8 p.m. *Ordinary Scientific Meeting*. "Tetrachloro - (triaminopropane - γ - monohydrochloride)-platinum, a new type of optically active complex salt," by F. G. Mann.
- Mar. 18. **CHEMICAL ENGINEERING GROUP AND THE INSTITUTION OF CHEMICAL ENGINEERS**. Joint meeting with the Coventry Engineering Society. "The importance of chemistry to the engineer," by Prof. J. W. Hinchley.
- Mar. 18. **SOCIETY OF DYERS AND COLOURISTS**, *Manchester Section*. 36, George Street, Manchester, at 7 p.m. "Cotton cellulose and cellulose artificial silks: A comparison of some fundamental physical and chemical properties," by A. J. Hall.
- Mar. 18. **BIOCHEMICAL SOCIETY**. University College, Gower Street, W.C.1. (1) "Carbohydrate metabolism of the brains of normal and diabetic animals," by B. Holmes and E. Holmes. (2) "Phosphagen," by P. Eggleton and M. G. Eggleton. (3) "The phosphorus of caseinogen," by C. Rimington and H. D. Kay. (4) "Observations on the sulphhydryl-disulphide system," by R. K. Cannan and B. C. J. G. Knight. (5) "Estimation of adrenaline," by L. C. Baker and G. F. Marrian. (6) "Observations on the adrenals of rats with relation to vitamin B," by L. C. Baker, G. F. Marrian and J. C. Drummond. (7) "The relation of vitamin B deficiency to inanition in the pigeon," by S. Kou and J. C. Drummond. (8) "The relation of certain dietary factors in yeast to growth on diets rich in protein," by A. Hassan and J. C. Drummond. (9) "The presence of calcium salts of glyceridephosphoric acids in the ether extract of cabbage leaf cytoplasm," by H. J. Channon and A. C. Chibnall. (10) "Some sterol colour reactions in their relation to vitamin A," by O. Rosenheim. (11) "Some observations on the dual nature of vitamin B," by M. H. Roscoe. (12) "A simple automatic apparatus for the rapid, quantitative removal of ammonia from solutions," and (13) "The pulsating bubble: a device for preventing 'bumping' in boiling liquids," by R. V. Stanford. From 3 to 4 p.m., the following demonstrations will be given:—(1) "An apparatus for propelling air round small enclosed circuits," by F. M. Haines. (2) "The chemistry of phosphagen," by P. Eggleton and M. G. Eggleton. (3) "The bacterial pigment pyocyanine," by R. K. Cannan and B. C. J. G. Knight.

CHEMICAL SOCIETY

Important announcements were made at a meeting on March 3 concerning the Annual General Meeting and Anniversary Dinner, to be held on March 24 at 4 p.m. and 7 for 7.30 p.m. respectively.

The President, Prof. H. Brereton Baker, C.B.E., F.R.S., announced that, no ballot being necessary, the following would then be declared elected: Vice-President who has filled the office of President, Prof. H. B. Dixon, C.B.E., F.R.S.; Vice-Presidents, Prof. G. G. Henderson, F.R.S., and Prof. A. Smithells, C.M.G., F.R.S.; Members of Council, Mr. E. R. Bolton, Prof. J. C. Drummond, Prof. J. F. Spencer, Mr. M. P. Applebey, Prof. J. E. Coates, O.B.E., and Dr. E. K. Rideal, M.B.E. The Presidential Address would be entitled "Experiments on molecular complexity."

Tickets for the Dinner to be held at the Hotel Victoria, King Edward VIIth Rooms, Northumberland Avenue, W.C.2, can be obtained from the Assistant Secretary, price 12s. 6d. each. It was announced that the Presidents of the following societies have accepted the invitation of the Council to attend the Dinner:—

The Royal Society.
The French Chemical Society.
The German Chemical Society.
The Italian Chemical Society.

The President expressed the hope that a large and representative gathering would be present to welcome these and other distinguished guests.

Fellows desiring to receive a copy of the List of Fellows for 1927 must make application by July 31, 1927.

Mr. R. W. Lunt described:—

The Decomposition of Carbon Monoxide in the Corona due to Alternating Electric Fields. Part II. [With R. Venkateswaran.]

A PRELIMINARY quantitative investigation has been made of the properties of the substance which is formed when carbon monoxide, at pressures from 200 to 690 mm., is subjected to ionisation by collision produced by alternating electric fields of frequency two hundred and fifty cycles per second. It has been shown that this substance reacts with water forming carbon dioxide, a brown solution containing oxalic acid and colloidal particles, and a dark coloured insoluble residue; and that, when removed from the vessel in which it had been produced, it has the empirical composition represented by $C_5O_3 \cdot x H_2O$.

The President remarked that the presence of water could be accounted for by the evolution of adsorbed water from the glass surface. He had used electric discharge for driving out such moisture from parts of apparatus which could not be heated strongly. He suggested that the author might have made a more important discovery than the one he had claimed. It seemed possible that the substance was a mixture of carbon with the often sought oxalic anhydride, C_2O_3 .

Mr. Lunt replied that experiments were in progress to determine how far the water might be ascribed to the presence of adsorbed moisture. He did not claim that the substance of empirical formula C_5O_3 was necessarily

an individual compound, but it was noteworthy that the composition remained the same over a wide range of pressure.

Prof. T. M. Lowry discussed:—

The Properties of the Chlorides of Sulphur. Part I. Freezing Points. [With L. P. McHatton and G. G. Jones.]

(a) Samples of sulphur chloride, which have been heated to 100° in sealed tubes in order to bring about a condition of equilibrium, give a freezing-point curve which exhibits not only the familiar maxima due to the crystallisation of S_2Cl_2 and SCl_2 , but also two well-defined breaks which are attributed to the crystallisation of SCl_2 and of a trisulphur tetrachloride, S_3Cl_4 .

(b) Although an equilibrium-mixture having the composition of sulphur dichloride deposits sulphur tetrachloride on freezing, freshly-prepared mixtures of sulphur monochloride with an over-chlorinated sample of sulphur dichloride exhibit a maximum freezing-point at the composition SCl_2 , which disappears when the mixture is brought to a condition of equilibrium. This is attributed to a rapid production of sulphur dichloride, followed by a slower process of destruction, perhaps $S_2Cl_2 + SCl_4 \rightarrow 3SCl_2$ and $2SCl_2 \rightarrow S_2Cl_2 + Cl_2$.

(c) Sulphur dichloride has been frozen out from freshly prepared mixtures, prepared as under (b), and has been recrystallised from light petroleum by cooling the solution with liquid air.

In reply to Mr. M. Zvegintzov, Prof. Lowry agreed that no indication would be obtained of the presence of any liquid lower chloride which was miscible with the solvent.

SOCIETY OF PUBLIC ANALYSTS

The annual general meeting was held at the Chemical Society's Rooms, Burlington House, on March 2, when the President, Mr. E. Richards Bolton, delivered his annual address.

The following were elected as officers and council for the year 1927: President, E. Richards Bolton; Past Presidents, serving on the Council, Leonard Archbutt, A. Chaston Chapman, Bernard Dyer, P. A. Ellis Richards, Alfred Smetham, G. Rudd Thompson, E. W. Voelcker, J. Augustus Voelcker. Vice-Presidents, R. L. Collett, C. H. Cribb, John White. Hon. Treasurer, Edward Hinks. Hon. Secretary, F. W. F. Arnaud. Members of Council, L. K. Boseley, H. E. Cox, John Evans, J. Golding, J. T. Hewitt, H. T. Lea, E. K. Rideal, W. H. Roberts, E. H. Merritt, W. H. Simmons, M. S. Salamon, James Wood.

An ordinary meeting of the society then followed, the President, Mr. E. R. Bolton, being in the chair.

Certificates were read for the first time in favour of:— Alfred George James Lipscomb, B.Sc. (Lond.), A.I.C., William L. Matthews, Sydney John Rogers, B.Sc., F.I.C., Ernest Fred Waterhouse, Harold William Webb, Arthur Samuel Wood, M.Sc., Ph.D., A.M.I.Chem.E.

Certificates were read for the second time in favour of:— W. G. Carey, F.I.C., W. F. Elvidge, B.Sc., A.I.C., L. S. Fraser, B.Sc., A.R.C.Sc., A.I.C., F. P. Hornby, B.Sc., A.I.C., G. R. Lynch, O.B.E., M.B., D.P.H., E. C. Martin, G. G. Philip.

The following were elected members of the society:— Solomon Greenberg, F.I.C., Frank Crafer Ray, M.A., F.I.C., and Geoffrey Charles Matthews, B.Sc., A.I.C.

The President, Mr. E. Richards Bolton, F.I.C., in his address, gave a blessing to the new Preservatives Regulations, which, he said, placed both the public analyst and the manufacturer in a much happier position than they were in before, because they prevented an unreasonable analyst from extremes of unreasonableness, and confined each and every manufacturer within limits beyond which his competitors could not reap an unfair advantage without risk of punishment. He complimented the free press, which by its habit of continually depreciating our actions spurs us on to better things; but he warned us not to be led astray by alarming articles magnifying a few cases of adulteration, thus causing the public to think that we live in the year 1820 when Accum wrote "Death in the Pot." He gave figures to show how the adulteration of food was steadily decreasing, which he attributed partly to the activity of the authorities, and partly to the efficiency of the public analysts. He urged the manufacturers to avail themselves of the services of a chemist to maintain the purity of their products and advise them in order to enable them to avoid any contravention of the law. Finally, he gave it as his opinion that the food of the country was never in a purer state than it now is.

A paper on "Cacao butter substitutes and their detection" was read by A. W. Knapp, B.Sc., J. E. Moss, M.Sc., and A. Melley. The most useful single test is the determination of the "titre" of the fatty acids, and, in the absence of certain other fats (e.g., coconut oil), this test enables the amount of Borneo tallow in admixture with cacao butter to be approximately determined after reference to a curve. A new method of determination has been based on the fact that the green colour of Borneo tallow is not bleached by ultra-violet light, whereas the yellow colour of cacao butter is readily bleached. A weighed quantity of the fat is exposed for six hours to the rays of a standardised quartz mercury vapour lamp, and the colour then compared with the colours of a set of standards containing definite amounts of Borneo tallow.

"The determination of illipé butter in chocolate" was discussed by H. W. Bywaters, D.Sc., F. T. Maggs, M.Sc., and C. J. Pool. A method is based on the fact that melted illipé butter becomes turbid at a much higher temperature than cacao butter, and that the turbidity temperature determined under definite conditions is practically constant for different specimens of the two fats. The method enables the amount of illipé butter in a mixture of the two fats separated from chocolate to be determined with a fair degree of accuracy. If a third fat (e.g., milk fat) is also present, the percentage of illipé butter may still be found by reference to a curve, provided that the amount of the third fat can be ascertained.

In a "Study of the determination of saccharin colorimetrically and by the ammonia process," A. F. Lerrigo, B.Sc., F.I.C., and A. L. Williams, A.I.C., described work done under the Analytical Investigation Scheme. The authors have studied five colour reactions of saccharin under variable conditions, and have found

that none of them gives quantitative results. On the other hand, the ammonia process (in which saccharin is converted into the ammonium salt of sulphobenzoic acid, the ammonia in which is determined by distillation) has been adapted to the determination of small quantities of saccharin.

INSTITUTE OF CHEMISTRY

At the 49th annual general meeting, held at 30, Russell Square, Prof. G. G. Henderson, the President, remarked that there appeared to be some abatement of the enthusiasm for chemistry as a career which was noted immediately after the war, although the roll of membership had increased by 242 during the year, to a total of over 5,200. It had not been the policy of the Institute to adjust the stringency of its regulations and examinations on any principle of supply and demand, but rather to indicate to those who believed that they had a bent for the science that it does not necessarily lead to fortune, that it calls for hard work and sacrifices, and, since the supply of chemists at present exceeds the demand, more than average ability is required for even moderate success. The industries of the country did not sufficiently absorb the scientific talent supplied by the universities, and it was to be deplored that many graduates had to turn to other callings.

The President then referred to the loss sustained by the death of Sir William Tilden, Past President, Sir John Burchmore Harrison, Prof. E. H. Rennie, Dr. J. J. Acworth, Mr. J. Webster and others, and reviewed the work of the various committees. He referred to the substantial legacy of about £5,000 bequeathed to the Institute by Sir Alexander Pedler.

The Legal and Parliamentary Committee had made representations to the Departmental Committee on the Poisons and Pharmacy Acts regarding the use of the title *chemist*, which in this country, as in no other, is confused with the profession and craft of pharmacy, and expressed the hope that the public would come to realise that it should be applied to those who seriously pursue the science and practice of chemistry in the investigation of the secrets of nature and in its application to the arts and manufactures. He knew that the difficulties were great, but hoped that the pharmacists, who were so fortunate in alternative designations, would realise how seriously the profession, to which they must acknowledge much indebtedness, was hampered by the existing confusion, and how far-reaching was the effect of this confusion in hindering the proper recognition by the community at large of the importance of the chemist and his science to industry and trade.

In October the Institute will celebrate its Jubilee, and a medal and prize have been established in honour of the first President, Sir Edward Frankland, who held office from 1877 to 1880; the award will be made to a registered Student for the best essay on a set subject of professional, as opposed to technical or purely chemical, importance. The subject for the first essay will be "The importance of chemistry to the welfare of the people."

The Public Appointments Committee is reviewing the position of public analysts under the Sale of Food and Drugs Acts, having particular regard to the increasing

duties and responsibilities imposed upon these officers, in respect of which local authorities in general had allowed very little or no additional remuneration.

Discussions on the subject of registration were proceeding at meetings of the local Sections of the Institute, which had been invited to submit concrete suggestions for the consideration of the council. The Institute had been given authority in 1885, by Royal Charter, to examine, to grant certificates of competency, and to register persons qualified to practise chemistry, and the council had done everything that reasonably could be done to provide for the admission to the ranks of the Institute of all who could claim to be trained and competent chemists. It was felt by many that the time had come to prepare some form of wider register of chemists of various grades, possibly with the ultimate object of securing powers for the restriction of practice to those who are duly qualified.

The position of the Institute was becoming steadily consolidated, and its place in the affairs of the country more and more definitely acknowledged. Its sections in all parts of the country were united in striving to secure adequate recognition of the national importance of chemistry. He hoped that when industrial activity was more fully restored, chemists would have greater opportunities of showing what they could do to help in maintaining the economic position of the country, and would themselves participate in the results, on a scale more representative of their deserts than they had done in the past.

On the completion of his term of three years in the office of President, Prof. Henderson acknowledged his appreciation of the support which he had received from the council and officers, and extended a welcome to Prof. Arthur Smithells, C.M.G., F.R.S., who is to succeed him in the chair.

The officers and council for the ensuing year were duly elected as follows:—

President—Prof. Arthur Smithells, C.M.G., F.R.S.
Vice-Presidents—Mr. E. R. Bolton, Dr. H. G. Colman, Mr. E. M. Hawkins, Prof. G. G. Henderson, D.Sc., F.R.S., Dr. R. H. Pickard, F.R.S., Prof. J. F. Thorpe, C.B.E., F.R.S. *Hon. Treasurer*—Mr. Patrick H. Kirkaldy. *General Members of Council*—Mr. F. W. F. Arnaud, Dr. T. Lewis Bailey, Mr. H. C. L. Bloxam, Mr. Arthur J. Chapman, Dr. F. D. Chattaway, F.R.S., Dr. G. C. Clayton, C.B.E., M.P., Dr. W. Clayton, Prof. J. W. Cobb, C.B.E., Dr. W. M. Cumming, Prof. J. C. Drummond, D.Sc., Dr. Bernard Dyer, Mr. A. Vincent Elsdon, M.B.E., B.Sc., Mr. A. G. Francis, B.Sc., Prof. Thomas Gray, D.Sc., Prof. I. M. Heilbron, D.S.O., D.Sc., Mr. Edward Hinks, M.B.E., B.Sc., Dr. H. H. Hodgson, M.A., Mr. Bernard F. Howard, Prof. C. K. Ingold, D.Sc., F.R.S., Mr. A. W. Knapp, B.Sc., Mr. T. Macara, Mr. B. G. McLellan, Mr. L. G. Radcliffe, M.Sc., Dr. Alfred Rée, Dr. E. K. Rideal, M.B.E., Mr. W. Rintoul, O.B.E., Mr. F. Scholefield, M.Sc. *District Members of Council*—Dr. D. F. Twiss, Mr. Frank Southerden, B.Sc., Dr. Richard Thomas, Mr. L. Eynon, B.Sc., Mr. William Marshall, Dr. P. E. Bowles, Mr. J. A. Watson, A.C.G.I., Mr. W. H. Coleman, Mr. C. M. W. Grieb, B.Sc., Mr. J. W. Totton, B.A., B.Sc., Dr. A. G. G. Leonard, B.Sc., F.R.C.Sc.I., Dr. F. Dent, M.Sc.

CORRESPONDENCE

OXIDE CATALYSIS

SIR,—In connexion with the specific subject of oxide catalysis as distinct from general surface action, can any of your readers say whether any quantitative measurements have been (or can be) made to determine the nature of the electrical charges on solid surfaces or gaseous masses due to the alternate reduction and re-formation of oxides?

I have in mind the marked activity of such oxides as those of iron, manganese, cobalt, vanadium, copper, etc., where it is possible to have the metal atom (or ion) in various degrees of oxidation. If, for instance, the conversion (in solution) of ferric compounds into ferrous compounds and metal can be represented by the expressions

or if, generally, we regard oxidation as a matter of electron losses, then in any reducible metallic oxide mass or surface which is acting as a catalyst for oxidation-reduction reactions, there will most likely be momentarily free electrons due to the equilibria $\text{Fe}_2\text{O}_3 \rightleftharpoons \text{Fe}_3\text{O}_4 \rightleftharpoons \text{FeO} \rightleftharpoons \text{Fe}$.

The appropriation of these electrons by reacting atoms would seem to be intimately wrapped up with the abnormal velocity of chemical reactions which we know as catalysis using the concept of reaction as pictured by G. N. Lewis, I. Langmuir, and others.

Even the mysterious and useful word "activation" might be pinned down if we could get hold of a measurement of the rate of liberation and appropriation of electrons due to alternate oxidation and reduction of the metallic atom (or even non-metallic atom) of which the catalyst is made up. Failing this, a quantitative relationship between charge, rate of charging upon the surface of the catalyst and the amount of reaction produced per gram molecule or gram atom of matter converted would be of value.

I am aware that the question of the hen, the egg and their relative claims to priority may be raised in this connexion by healthy sceptics and first cause enthusiasts, but I am also of the opinion that to raise it is unnecessary.

So far, the only work which has caught the eye of the writer is the valuable qualitative work done by Bone and his co-workers in connexion with the Gas Engineers' Fellowship at Leeds University and some interesting work done recently on the charges remaining on gases after partial and complete combustion. The products of complete combustion (not necessarily "surface" combustion) are electrically neutral, whilst the products of an incomplete reaction are not neutral.

Such work as is known does not, however, so far as one can see, throw light on the specific point raised here, which is that the cloud of electrons possibly produced by the rapid, alternating reductions and oxidations of the catalytic surface might serve as the active influence in promoting vigorous reaction at the surface of oxidisable catalysts. It is quite possible that the term "oxidisable" may have to be made quite elastic so as to include such things as the silver oxygen complex.

If any of your readers can help and are willing to do so it might prove to be a matter of great interest and possible general utility.

Yours faithfully,

H. H. GRAY

AN ABSORBENT FOR OXYGEN

SIR,—In the JOURNAL for February 18, Mr. H. F. Taylor enquired about the action of carbon monoxide on Hartshorne and Spencer's reagent for absorbing oxygen, viz., a chromous chloride amalgamated zinc mixture. This reagent has been used in this laboratory for removing oxygen from carbon monoxide, carbon dioxide and nitrogen, for which purpose it has proved rapid and effective. When brought into contact with carbon monoxide in the absorption vessel of a Bone and Wheeler gas analysis apparatus no measureable absorption occurred. Thus it might serve as a reagent in flue gas analysis. There are indications, however, of a slow evolution of hydrogen on standing, but this is perhaps negligible for many purposes.

Yours faithfully,

H. T. ANGUS

Department of Coal Gas and Fuel Industries,
The University, Leeds

THE SPACE FORMULA OF DIPHENYL

SIR,—My attention has been drawn to the article in your issue of November 12, 1926, on "The Space Formula of Diphenyl," by Messrs. Turner and Le Fèvre, and to subsequent correspondence by Messrs. Bell and Kenyon, Mills, and the first-mentioned writers. Dr. Christie has also forwarded me a copy of his letter in reference to the same subject.

This contribution must arrive much later, but I may perhaps also be permitted to indicate my attitude towards the problem. This is the more desirable since a series of circumstances have latterly prevented me from finally preparing a quantity of results for publication, and it now appears that Messrs. Bell and Kenyon have taken the very unusual course of entering a field of work opened up by my collaborators and myself, without any inquiry as to our plans for future work. Messrs. Turner and Le Fèvre have given an impartial expression on this aspect of the matter, whilst Dr. Christie has referred to the overlapping which, as might have been anticipated, has immediately resulted. It is therefore unnecessary for me to comment further in this direction.

The unprecedented character of the isomerism represented by the optically active forms of the diphenic acids decided me at the outset to do nothing more than indicate in the most general manner possible alternative explanations, and to seek a decision between them by experiment rather than to express definite preference. It was, however, pointed out to me by Sir William Bragg, immediately after the first publication on the subject, that the crystal structure of diphenyl is definitely in disagreement with the Kaufler formula, and the data bearing on this point have since been published (X-rays and Crystal Structure, 1924, page 251). In 1922 it seemed to me that the comparisons between the results of X-ray analysis of crystals and those of stereochemical investigation were not sufficiently numerous to render the evidence of crystal structure conclusive in regard to separate molecules. Since that time, however, apart from definite expressions of opinion on the point (compare, for example, Annual Reports of the Chemical Society, 1923, 20, 232; 1924, 21, 220), the gradually increasing weight of experimental evidence has suggested

that in the great majority of cases, if not in all (and this is at the moment the subject of active controversy), there is close correspondence between the two. For this reason, I had for some time past discarded the Kaufler formula as a basis of investigation, and the work of Messrs. Turner and Le Fèvre has provided a welcome confirmation of the correctness of this attitude.

As indicated in the first paper on the subject of the optically active diphenic acids, the simplest alternative is a formula in which the planes of the two benzene nuclei are inclined to each other about a common axis. As Messrs. Turner and Le Fèvre have emphasised, all instances of asymmetry among these compounds so far recorded are those of structures which have either three or four of the 2, 2', 6, and 6'-positions occupied by substituents, and I may add that further instances of this kind have been observed in 6-nitro-, 4:6:4':6'-tetrabromo-, 4:4'-dicarboxy-6:6'-dinitro-, and 6:6'-dimethoxy-diphenic acids, as well as 2:2'-dinitro-6:6'-dichlorodiphenyl-4:4'-dicarboxylic acid. The last case shows that carboxyl groups in the 2:2'-position are not essential to the occurrence of isomerism. On the other hand, no resolution of 4-nitro-, 4:4'-dinitro-diphenic acids or of certain other similarly constituted compounds has so far been achieved, although further experiments are always desirable in such cases.

These results, together with the repeated use I have made of steric conceptions in other directions, had predisposed me in favour of a view such as has now been enunciated by Dr. Mills as a basis of explanation of the observed asymmetry. Again, however, before committing myself to this fairly obvious hypothesis, I have proposed to test it experimentally by the examination of (a) other compounds with only three of the positions in question occupied; (b) 3:5:3':5'-compounds analogous to the 2:6:2':6'-derivatives already mentioned. Unfortunately in this connexion, 5:5'-dinitrodiphenyl-3:3'-dicarboxylic acid is not accessible by the usual procedure, but the synthesis of other acids and bases of this type is in progress; (c) derivatives of fluorene and diphenylene oxide in which the plane configuration of the five-membered ring might be expected to inhibit isomerism of the type in question. The case of 6:6'-dimethoxydiphenic acid is the logical preliminary, and my plans in this direction had already been made when the work of Mills and his collaborators on fluorenone-4-carboxylic acid was published; (d) diphenyl-2:6:2':6'-tetracarboxylic acid and its derivatives, and thus to obtain indications whether, as seems probable, the planes of the two benzene nuclei are at right angles; (e) 6:6'-difluorodiphenic acid as a compound with two substituents of small "atomic volume."

There is still another avenue of approach to this matter which, whilst perhaps less direct, is nevertheless that by which the problem was first revealed, and that is in connexion with the formation of seven-membered

rings from 2:2'-ditolyl. At the time of these observations, I suggested they were explicable in terms of the ordinary strain theory on the basis of a plane configuration of the seven-membered ring, and experiments are now in progress to test this by the resolvability or otherwise of the acid (A) and its derivatives with substituents in the benzene nuclei. The interest of this lies in the fact that a consideration of the strainless form of the seven-membered ring indicates that such a structure might, though perhaps improbably, be attached to the two benzene nuclei of diphenyl if these are twisted relatively to each other as might be the case in diphenyl derivatives; but that in that case the acid would be asymmetric in structure, and this latter would be sufficiently rigid (as contrasted with the lability of the free strainless seven-membered structure) to permit of the application of the ordinary tests. Quite apart from its intrinsic interest in connexion with the ordinary theory of ring structure, this matter has a direct bearing on the diphenyl problem, for there are indications, on which I once commented in discussion at a meeting of the Chemical Society, but which I have so far been prevented from examining more closely, that substitution affects the ease of formation of the seven-membered rings in question. Whereas the acids which have been shown to be asymmetric in structure are easily convertible by the usual procedure into their chlorides, this is not the case with diphenic acid itself, which under ordinary

conditions yields the anhydride. This would easily be explained if the plane structure of (A) be verified, by assuming that the presence of one or more substituents in the 6- and 6'-positions militates against the attainment of a plane molecular configuration. Reasons of this kind render me doubtful whether diphenic acid or its derivatives will prove to be resolvable. The results of the two lines of inquiry would thus converge towards the same conclusion.

I need only refer to the possibility of obtaining still further evidence from a study of derivatives of diphenylmethane and dibenzyl in order to mention that experiments on the synthesis of the latter have also engaged my attention.

Pending the outcome of these various investigations, the simple steric explanation makes a greater appeal to me than that put forward by Messrs. Turner and Le Fèvre. It seems to me improbable that their formula (X) represents as saturated, and therefore as stable, a condition as the ordinary one. In applying, too, conceptions of mutual saturation of residual affinities, regard must be paid to the kind of these. From this point of view, it would seem doubtful whether carboxyl groups would tend to stabilise a plane configuration in the manner suggested. Accepting, however, this proposition for a moment, and its derivation from Flürscheim's theory, nitro-groups might also be expected to exert a similar influence. Yet 6:6'-dinitrodiphenic acid is asymmetric. In fact, my object in studying the variety of compounds previously referred to was to ascertain whether the nature, in the sense referred to by Messrs.

Turner and Le Fèvre, of the substituents has any influence. It is seen that, in conjunction with the carboxyl or nitro-groups, both *ortho-para* and *meta-directive* groups can give rise to the isomerism. From this point of view, it only remains to examine compounds with four *ortho-para* directive substituents in the effective positions.

I trust, Sir, this discussion may have indicated not only my general position, but also that I am actively interested in regard to the problem first brought to light by my work. I venture, therefore, to hope that its further investigation along the lines indicated may be left in the hands of my co-workers and myself.

Yours faithfully,

J. KENNER

University of Sydney,
Department of Organic Chemistry

OBITUARY

DR. A. W. CROSSLEY, F.R.S.

With deep regret we record the death of Dr. A. W. Crossley, F.R.S., whose resignation of his post as Director of Research for the British Cotton Industry Research Association was announced only last week. Dr. Crossley, who was born in 1869, was educated in Owens College, Manchester, and also at Würzburg and Berlin, became Professor of Chemistry to the Pharmaceutical Society in 1904, and later Daniell Professor of Chemistry at King's College, London. In 1915 he was appointed Secretary to the Chemical Warfare Committee of the Ministry of Munitions, and became liaison officer for chemical warfare between the British and French Armies. In 1916 he was appointed Commandant of the experimental station of the Royal Engineers, and for his extremely important work was made C.M.G., C.B.E., and an officer of the Legion of Honour. After the war he was invited to become Director of Research to the British Cotton Industry Research Association and organised the well-known Shirley Institute in Manchester.

Dr. Crossley was elected to the Royal Society in 1907, and in 1918 was Longstaff Medallist of the Chemical Society. He had been foreign secretary of the Chemical Society for several years, and was elected to the presidency in 1925, but felt himself unable to continue in office owing to continued ill-health, which, in the last few months, prevented him from keeping in full control of the Shirley Institute.

To him was due the success and growing accomplishment of the Shirley Institute, and he was no less successful in gaining the confidence and esteem of the leaders of the British cotton industry than he was in co-ordinating the wide range of researches necessary in an industrial research association. In him were combined to an unusual degree the abilities of a chemist and an administrator, and British chemistry is all the poorer for his loss.

DR. LUIGI CASALE

The late Dr. Casale was born at Langosco (Lomellina) on November 22, 1882. In 1908 he graduated in chemistry at the Royal University of Turin, and obtained, in 1909, the Postgraduate Degree of the Royal Polytechnic of Turin. From 1909 to 1912 he acted as Assistant

Professor at the Institute of General Chemistry at Turin University, and in 1912 and 1913 took a special course of physical chemistry with Professor Nernst at Berlin. From 1913 to 1915 he was head of the Laboratory of Organic Synthesis in the Institute of General Chemistry at the University of Turin, and from 1915 to 1917 was head of the Laboratory of Pharmaceutical Chemistry at the University of Naples. While head of this laboratory he was principally engaged in the manufacture of poison gas for the Italian War Office.

It had been realised in official circles in Italy towards the close of the war that, owing to the absence of coal resources in Italy, special measures should be taken to develop the production of fixed nitrogen from sources

Dr. Casale (from a sketch made at a dinner in London in May, 1925).

other than coal. Italy is rich in water-power resources, and the important work of harnessing these resources for the manufacture of synthetic ammonia was entrusted to Dr. Casale. He commenced this research in 1917, when, owing to an attack of gas-poisoning, he had to relinquish the war-work on which he had previously been engaged. As a result of his researches ammonia was first produced in his laboratory in 1920, and within the short space of three years commercial plants capable of producing 3 tons and 7½ tons of ammonia respectively were in commercial operation on his process. In 1921 the Ammonia Casale Company, with a capital of 12,000,000 Swiss fr., was incorporated for exploiting the patents for the production of synthetic ammonia taken out by Dr. Casale.

Since 1923 the progress of the Casale process has been extraordinarily rapid. Manufacturing rights have been granted in most countries of the world, and plants are now in operation or in course of erection in some 15 countries. The remarkable development of the process will be obvious from the fact that the total capacity of the plants completed or in course of construction on Dr. Casale's system exceeds 250,000 tons of ammonia, or some 1,000,000 tons of ammonium sulphate per annum. It is interesting to note in this connexion that the world output of synthetic ammonia in 1925 was approximately 350,000 tons. The latest technical development for which Dr. Casale was responsible was the construction of large single units for ammonia synthesis, each unit being capable of producing over 20 tons of ammonia daily. At a conference, a week before his death, of the International Consultative Committee, which he formed some two years ago to advise his company, he stated that the size of this unit must not be taken as marking finality, as he was ready to produce units considerably larger immediately the demand for them arose. Units with an output of 20 tons per day designed by him, it may be added, are now installed in France and in Japan. During the past few years Dr. Casale has been engaged in the large industrial research laboratory equipped by him at Terni in Italy, on researches in connexion with the syntheses of methyl alcohol and of urea, and industrial plants based on these researches are expected to be in operation shortly.

It is fortunate that, notwithstanding the early death of this distinguished scientist, the principal work with which his name is associated, namely, the production of synthetic ammonia, can be regarded as being, from a technical point of view, complete. With rare foresight he had also, with a view to securing continuity of technical service for his company, appointed the International Consultative Committee, to which reference has already been made. The work of Dr. Casale was distinguished by exceptional thoroughness, by simplicity of design of the apparatus produced under his direction, and by the great care that was devoted to detail. Few men have been able to achieve so much in such an important field in so short a time. One of the tragedies of Casale's early death is that it prevented him from witnessing the realisation of his latest discoveries in the plants which have been built under his direct supervision at the works of the Società Italiana Ricerche Industriali at Terni, Italy, where he had erected his industrial research laboratory.

Dr. Casale's high qualities, personal charm, and exceptional ability gained for him a large number of friends, including many of distinction, and his achievements in applied chemistry have placed his name on the distinguished roll of eminent scientists which is one of the glories of his country.

J. F. CROWLEY

PERSONAL AND OTHER ITEMS

Last week Lord Balfour opened an exhibition in the Science Museum, South Kensington, which illustrates some of the work of the British Research Association for the Woollen and Worsted Industries.

Prof. D. A. Gilchrist, Professor of Agriculture at Armstrong College, Newcastle, and Director of the famous Northumberland County Agricultural Experiment Station at Cockle Park, has resigned his post on reaching the retiring age.

The Vice-Chancellor of Cambridge University, Dr. G. C. Lamb, Mr. C. T. Heycock, Sir William B. Hardy, Mr. F. F. Blackburn, and Mr. G. H. A. Wilson have been appointed a syndicate for the extension of the Low-Temperature Station for Research in Biochemistry and Biophysics.

The Department of Scientific and Industrial Research is considering the appointment of a Director of Research into the prevention of water pollution and cognate problems.

Mr. F. B. Guthrie, whose death, at the age of 65 years, is announced, had been chemist in the New South Wales Department of Agriculture for some thirty years.

We regret to learn of the death, at the age of 81, of Prof. Ira Remsen, who was one of the pioneers of American chemistry, both pure and applied. He was the author of several text-books and of numerous papers, and was the founder of the *American Chemical Journal*, which he edited until 1914, when he transferred it to the American Chemical Society, whose *Journal* took its place. Prof. Remsen was President of the Society of Chemical Industry during the year 1909—1910.

Prof. L. Spiegel, who died recently at Charlottenburg, aged 62, was the discoverer of the drug yohimbin, and had contributed largely to the literature of the alkaloids. He was a member of the editorial board of the "Chemische Centralblatt" for many years, and had published several books on pharmacology.

Technical Data

M. Ch. Marie, General Secretary of the International Committee responsible for the publication of the "Annual Tables of Constants and Numerical Data," announces the publication of a volume entitled "Numerical Data for Engineering—Metallurgy," extracted from Vol. V of the "Annual Tables." The volume, which is by M. L. Descroix, and contains a preface by Sir Robert Hadfield, Bart., F.R.S., includes all the data relating to engineering and metallurgy for the years 1917—1922 inclusive. The price of the volume is, paper backed, 105 francs, bound 126 francs, but to members of the Society of Chemical Industry the price is reduced to 78.75 francs and 94.50 francs, respectively.

A similar volume, also extracted from Vol. V of the "Annual Tables," and entitled "Numerical Data for Electricity, Magnetism, Electrochemistry," by M. G. Malapert, Dr. A. Buffat, Dr. G. I. Higson and Dr. K. Gordon, has also been published. The price—paper backed 56 francs, bound 77 francs—is reduced for members of the Society of Chemical Industry to 42 francs and 57.75 francs, respectively.

Analysis of British Standard Bull Head Rails

The British Engineering Standards Association announces an alteration to the chemical composition specified in the British Standard Specification No. 9, 1922, for bull head railway rails, an increase of 0.01%

for sulphur and phosphorus having been agreed to for "ordinary carbon" and "higher carbon" rails made by the acid open-hearth process, and also for phosphorus for "higher carbon" rails made by the acid Bessemer process. The revised figures are as follows:—

Steel made by the acid open-hearth process (ordinary carbon).	Phosphorus 0.07% max. Sulphur 0.07% max.
Steel made by the acid open-hearth process (higher carbon).	Phosphorus 0.06% max. Sulphur 0.06% max.
Steel made by the acid Bessemer process (higher carbon).	Phosphorus 0.07% max.

A slip giving the revised figures for insertion in existing copies of the specification may be obtained from the Association by forwarding a stamped addressed envelope to the British Engineering Standards Association (Publications Department), 28, Victoria Street, London, S.W.1.

Survey of the Rubber and Paint and Varnish Trades in 1924

"Preliminary Reports No. 2" of the Third Census of Production (1924) give information regarding the rubber, paint, colour, and varnish trades, from which we extract the following data:—

The rubber trade return shows a high production in motor-car and cycle tyres, rubber boots and shoes, and rubber-proofed garments. During the census year 1,907,500 rubber proofed garments, valued at £1,610,000; 7,237,400 inner tubes, valued at £1,218,000; and 1,927,100 motor-tyre covers, valued at £4,913,000, were produced. The total value of the rubber goods made and the work done is returned as £23,309,000, compared with £8,908,000 in 1907. Between 25 and 30% of the output of various classes of motor-tyre covers and inner tubes were exported, while imports exceeded exports in quantity, largely in motor-tyre covers, and to a small extent in inner tubes. The imports of cycle-tyre covers were 13% of the number made. Exports of solid rubber tyres were 15.5% of the total made, and the net imports amounted to 18%, and of the total production of rubber boots and shoes 26% were exported, the net imports being nearly 23%. £11,503,000 was the net output of the establishments which made returns, and the net output per person employed was £247, as compared with £124 in 1907. In 1924, 46,565 persons were employed, and in 1907 the number totalled 24,039.

In 1924 the total value of the output in the paint and varnish trades was £17,062,000, compared with £8,562,000 in 1907. Exports of boiled and refined linseed oil in 1924 amounted to 14,746 tons, and were about 70% of the recorded output. Exports of ochre, oxides, and earth colours were 9,800 tons, about 44% of the quantity produced, and of paints and enamels 36,900 tons, or about 22% of the output, were exported. About one-seventh of the total production of varnish, i.e., 1,378,000 gallons, was exported. The net output of the factories was £7,739,000, and per person employed £413, as against £198 in 1907. On an average 18,761 persons were employed in the industry during 1924, compared with 13,840 in 1907: the largest number of working staff employed in the industry in any week was 12,964 in June, and the smallest, 12,353, in January.

PARLIAMENTARY NEWS

Sugar Beet Factories

Mr. Guinness informed Mr. Thurtle that the total amount of subsidy on sugar and molasses received by the British beet-sugar factories in the manufacturing season 1925—26 was £1,124,207, and in the season 1926—27 up to February 28, 1927, was £3,041,083. The number of persons employed in the factories during these same periods was 4,613 and 7,194 respectively. With regard to adequate methods of treating the effluents from sugar-beet factories, arrangements had been made by the Department of Scientific and Industrial Research for certain investigations to be set on foot at the Rothamsted Experimental Station, by which it was hoped that the solution of this difficult problem might be advanced.—March 2.

Glaze Testing in Pottery Manufacture

In reply to Mr. Clowes, Sir W. Joynson-Hicks said that it was not the practice to take a sample of the glaze for testing purposes immediately after a pottery firm changed from lead glaze to leadless or low solubility glaze, but before the change took place the inspector must be satisfied that the glaze would conform to the prescribed standard. After that, reliance was placed mainly upon systematic routine sampling. The total number of samples taken under the Regulation was, in 1924, 83; in 1925, 97; and in 1926, 84.—March 3.

Paint (White Lead)

In answer to Mr. Viant, Sir W. Joynson-Hicks said that the explanatory letter issued with the draft Regulations under the Lead Paint Act stated that the terms of the Regulations had been discussed at a series of conferences with the industry, at which a complete agreement was arrived at. The reference here was to certain conferences held in 1922 for the purpose of determining what Regulations could be made in the event of the Geneva Convention being ratified. Conferences had not been held subsequently to the passing of the Act, and the draft Regulations were not the outcome of a fresh agreement. The sole object of the circular was to remind the industry of the previous discussions and the agreement then reached, which applied not only to external painting, but also to internal painting during the interval before the prohibition was to take effect. Since the issue of the draft Regulations there had been a further meeting with the representatives of the industry. This resulted in general agreement on the points discussed.—March 3.

Palm Kernels and Palm Oil from British West Africa

Mr. Amery informed Mr. Kelly that the total value of the exports of palm kernels and palm oil in 1914 was about £4,850,000, in 1924, £9,752,307, in 1925, £10,521,280, and in 1926, £10,500,000. The tonnage of these exports for the same years was 280,908 in 1914, 452,777 in 1924, and 475,941 in 1925.

COMPANY NEWS

JOSEPH CROSSFIELD AND SONS, LTD.

The accounts for the year to November 30, 1926, in which associated companies have been treated as branches of the business, show a profit of £398,611, including

£55,589 brought forward, after charging all repairs, renewals and alterations, depreciation and insurance. The profit for 1925 was £383,089. The dividends on the preference shares absorb £227,500, and the dividend of 10% on the ordinary shares (same for 1925) absorbs £100,000. The sum of £60,560 has been transferred to general reserve, leaving £10,551 to be carried forward. Reference is made in the report to the loss sustained by the company by the retirement of Mr. C. F. Huffam from the chairmanship. Mr. G. H. K. Kingdon has been elected as chairman.

WALKERS, PARKER AND CO., LTD.

The profit for 1926 amounted to £33,376, against £39,184 for 1925. The dividend is 11½% (same), and after placing £3,000 to employees' fund (same), there remained £64,094 to carry forward, against £62,967 brought in. Trade uncertainties still exist, but the directors point out that, owing to the policy of financial strength, the company is in an excellent position to meet abnormal circumstances.

LONDON AND THAMES HAVEN OIL WHARVES, LTD.

The profit for 1926, including £58,361 brought in, was £169,617, compared with £149,525 for 1925. A final dividend has been recommended on the ordinary shares of 5%, free of tax, making 10% for the year, and a bonus of 5%, free of tax, being the same as for the previous year, leaving £79,154 to be carried forward. The capital is to be increased to £1,000,000 by the creation of 500,000 £1 ordinary shares, of which £250,000 are to be offered to ordinary shareholders at £1 per share premium in the proportion of one new share for each two held.

BRITISH METAL CORPORATION

The net profit for 1926, after transferring £50,000 to reserve, amounted to £81,791, against £80,182 for 1925. A dividend has been recommended of 8% (same), leaving £23,278, compared with £19,967, to be carried forward. Mr. W. S. Robinson has been elected to the Board in succession to the late Mr. F. A. Govett. Besides being managing director of the Australian Board of the Broken Hill Associated Smelters Proprietary, Mr. Robinson is a director of several metallurgical companies, including the British Australian Lead Manufacturers.

INDESTRUCTIBLE PAINT AND STANDARD VARNISH CO., LTD.

The net profit for 1926 was £21,242, plus £2,264 brought in, compared with £23,300 for 1925. The directors recommend transferring £3,000 to reserve for income-tax, writing down goodwill £2,000, placing £2,500 to reserve account, and £5,000 to depreciation reserve. A final dividend has been recommended of 5% actual, less tax, making 10%, carrying forward £3,506.

NEW TRANSVAAL CHEMICAL CO., LTD.

For the year ended June 30, 1926, the net profit was £28,370, plus £28,686 brought in, after charging depreciation for the year, which compares with a profit of £47,897 for 1925. A dividend has been recommended of 10% on the ordinary shares, carrying forward £7,426. The effect of the agreement with the Associated Enterprise is not reflected in the accounts for 1926, as the scheme only came into operation as from July 1, 1926.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
Acid Hydrochloric—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
Bisulphite of Lime—£7 10s. per ton, packages extra.
Bleaching Powder—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
Borax, Commercial—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
Copper Sulphate—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate—£38 per ton d/d.
Nickel Ammon. Sulphate—£38 per ton d/d.
Potash, Caustic—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammoniac—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
Salt Cake—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%—£21 per ton. Sod. Bicarbonate (refined)—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%—£17 per ton, home market, 1-cwt. iron drums included. Sod. Chlorate.—2½d. per lb.
Sod. Phosphate—£14 per ton, f.o.r. London, casks free.
Sod. Sulphate (Glauber's Salt)—£3 12s. 6d. per ton.
Sod. Sulphide conc. solid 60/65—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide—Golden.—6d.—1s. 5½d. per lb., according to quality.
Crimson—1s. 3d.—1s. 7½d. per lb., according to quality.
Arsenic, Sulphide, Yellow—2s. per lb.
Barytes—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide—2s. 9d. per lb.
Carbon Bisulphide—£20—£25 per ton, according to quantity.
Carbon Black—5½d. per lb., ex wharf.
Carbon Tetrachloride—£46—£55 per ton, according to quantity, drums extra.
Chromium Oxide, Green—1s. 2d. per lb.
Diphenylguanidine—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. R.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 5s. per ton. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£7—£10 per ton, according to grade and locality.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; ½s. per gal. 24° Tw.
 Red Liquor.—9d.—1s. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 4s. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P.
 Wood Tar.—£4—£5 10s. per ton and upwards, according to grade.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carboic.—Crystals, 6d.—6½d. per lb. Crude 60's, 1s. 8d.—1s. 9½d. per gal.
 Acid Cresylic, 99/100.—2s. 3d.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 3d. per gal. Pale, 95%, 1s. 10d.—2s. 2d. per gal. Dark, 1s. 9d.—2s. 1d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 2½d.—1s. 3½d. per gal., ex works in tank wagons; Standard motor. 1s. 11d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s. 2d.—2s. 6d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 11½d. to 2s. 3d. per gal. Firm. Pure, 2s. 3d.—3s. per gal.
 Xylol.—2s. 3d.—3s. per gal. Pure, 4s. per gal.
 Creosote.—Cresylic 20/24%, 10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal.
 Naphtha.—Crude, 9½d.—1s. 0½d. per gal., according to quality. Solvent 90/160, 2s.—2s. 1d. per gal. Solvent 95/160, 1s. 9d.—1s. 10d. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
 Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—95s.—110s. per ton, f.o.b. according to district.
 Pyridine.—90/140.—9s. 6d.—13s. per gal. Nominal. 90/180 — 7s. 6d. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis. d/d.
 Acid Sulphanilic.—9d. per lb. 100% basis d/d.

Aniline Oil.—7d. per lb., naked at works.
 Aniline Salts.—7d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d. per lb.
 m-Cresol 98/100%.—2s. 8½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorobenzene.—£75 per ton d/d.
 Dinitrotoluenec.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—7d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4½d.—2s. 6d. per lb. Brisk.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots 1s. per oz.
 Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 4d.—1s. 4½d. per lb. Less 5%. Firm.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4d.—1s. 6d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 1½d. per lb. Less 5%. Firmer market.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—11s. 3d.—11s. 6d. per lb.
 Animon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.
 Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 4d.—2s. 6d. per lb. Potassium.—1s. 11d.—2s. 1d. per lb. Sodium.—2s. 2d.—2d. 4d. per lb. All spot.

Calcium Lactate.—1s. 4d.—1s. 5d. per lb.

Chloral Hydrate.—3s. 2d.—3s. 5d. per lb., duty paid.

Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.

Cresotic Carbonate.—6s. per lb.

Ether meth.—1s. 1d.—1s. 11½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—6s. 6d.—7s. per lb.

Hexamine.—2s. 4d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.).—1s. 5d. per gal. f.o.r. makers' works, naked.

Hydroquinone.—4s. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—22s. per cwt., 112 lb. lots.

Magnesium Carbonate.—Light Commercial £33 per ton net.

Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%, in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 10s. 6d.—12s. per lb., according to quantity; Liquid (95%), 12s. per lb. Detached cryst., 14s. 6d. per lb.

Mercurials.—Red oxide, 6s. 5d.—6s. 7d. per lb., Levig, 6s. 1d. per lb.; Corrosive sublimate, Lump, 4s. 8d.—4s. 10d. per lb., Powder, 4s. 3d. per lb.; White precip., Lump, 4s. 10d.—5s. per lb., Powder, 5s. 1d. per lb., extra fine, 5s. 1d.—5s. 2d. per lb.; Calomel, 5s. 3d.—5s. 5d. per lb.; Yellow Oxide, 5s. 10d.—5s. 11d. per lb.; Persulph B.P.C., 5s. 1d.—5s. 2d. per lb.; Sulph. nig., 4s. 10d.—4s. 11d. per lb.

Methyl Salicylate.—1s. 8d. per lb.

Methyl Sulphonal.—15s.—15s. 3d. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—3s. 9d.—4s. per lb.

Phenazone.—5s. 9d.—6s. per lb.

Phenolphthalein.—6s.—6s. 3d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 94s. per cwt., less 2½% for ton lots. Dearer.

Potass. Citrate.—1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins.

Resorcin.—4s. per lb. spot.

Saccharin.—55s. per lb.

Salol.—3s.—3s. 3d. per lb.

Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—77s. 6d.—82s. 6d. per cwt. net, according to quantity.

Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal 1s. 10d.—1s. 11d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.

Sulphonal.—10s.—10s. 3d. per lb.

Tartar Emetic B.P. cryst. or powder.—2s.—2s. 1d. per lb.

Thymol, Puriss.—11s. 6d.—12s. per lb., according to quantity. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.

Aubepine (ex Anethole).—10s. 3d. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb. Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.

Cinnamic Aldehyde.—Natural, 17s. 6d. per lb.

Coumarin.—10s. 9d. per lb.

Citronellol.—15s. per lb.

Citral.—9s. 6d. per lb.

Ethyl Cinnamate.—10s. per lb.

Ethyl Phthalate.—3s. 3d. per lb.

Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—10s. per lb. Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 10d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol (ex Shui Oil) 12s. per lb.—(ex Bois de Rose) 16s. per lb. Linalyl Acetate.—(ex Shui Oil) 14s. 6d. per lb.—(ex Bois de Rose) 19s. per lb.

Methyl Anthranilate.—9s. per lb.

Methyl Benzoate.—4s. 6d. per lb.

Musk Ketone.—36s. per lb.

Musk Xylol.—8s. 6d. per lb.

Nerolin.—3s. 9d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—11s. per lb.

Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 6d. per lb. Vanillin.—17s.—19s. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—30s. per lb. Bourbon Geranium.—11s. 3d. per lb.

Camphor.—63s. 6d. per cwt. Cananga, Java, 22s. 6d. per lb. Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure.—6s. per lb.

Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 20s. 9d. per lb. Lemon.—9s. 6d. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb. Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 20s. 9d. per lb. Japanese, 8s. 6d. per lb. Firmer. Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and ~~as~~ ⁱⁿ opposition not later than April 30th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on ~~Mar. 11th~~ ^{Mar. 17th}. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted ~~as~~ ⁱⁿ.

I.—Applications

Blythe. Furnaces. 5210. Feb. 24.
Brown and Son (Alembic Works), Ltd., and Easterbrook. Mixing etc. apparatus. 5389. Feb. 25.
Carrier. Refrigeration. 4929. Feb. 21.
Chem. Fabr. Pott & Co. Producing solvents etc. 5402. Feb. 25. (Ger., 25.2.26.)
Haddan (Oliver Continuous Filter Co.). Pulp thickeners etc. 5146. Feb. 23.

Hayward. Apparatus for effecting reactions between solid materials and gases. 5052--3. Feb. 22.

Henshaw, Parker, and Holmes & Co. Drying gases. 5264. Feb. 24.

Higginbottom. Pulverisers. 5233. Feb. 24.

Howard. Devices for separation of liquids or gases. 5077. Feb. 23.

McDougal. Heat-treatment. 4901. Feb. 21.

Pare Engineering Co., Ltd., and Player. Means for mixing gases and liquids. 5122. Feb. 23.

Raw. Separation of solid materials of different specific gravities. 5479. Feb. 26.

Sainty. Treating divided materials. 5393. Feb. 25.

Salerni. Grinding etc. machines. 5478. Feb. 26.

Scaman and Titterton. Rotary vacuum filters etc. 5259. Feb. 24.

Vernay. Extracting solid matters in suspension in a liquid. 5015. Feb. 22. (Fr., 24.2.26.)

Wisner. Lubricants. 5410. Feb. 25.

I.—Complete Specifications

20,230 (1925). Pattison (Mount). Kilns. (265,654.)

20,230 (1925). Foster. Optical pyrometers. (266,060.)

30,642 (1925). Callebaut and Blicquy. Heating of liquids. (266,075.)

32,419 (1925). Halls. Estimating the quantity of a gas in a mixture of gases. (266,091.)

80 (1926). Taylor and Shaw. Apparatus for treating gases. (266,097.)

310 (1926). Surtees. Emulsifying, mixing, or grinding machines. (266,098.)

443 (1926). Carborundum Co., Ltd. (Carborundum Co.). Heat-exchangers. (266,100.)

5045 (1926). Johnson (I.-G. Farbenind.). Manufacture of porous adsorbents. (266,133.)

6140 (1926). Carborundum Co. Furnaces. (266,140.)

6558 (1926). Mond (Metallbank und Metallurgische Ges.). Recovering volatile solvents. (266,145.)

9517 (1926). Robertson (Power Specialty Co.). Furnaces. (266,166.)

12,452 (1926). Schmidt and Dyckerhoff. Heat-insulating process and materials. (266,177.)

21,320 (1926). Martyn. See X.

II.—Applications

Baume. Drying etc. carbonaceous etc. materials. 5258. Feb. 24.

Coley. Apparatus for manufacture of gas. 5229. Feb. 24.

Hovois. Washing coal ores. 5061. Feb. 22. (Belg., 25.2.26.)

Humphrey, and Synthetic Ammonia and Nitrates, Ltd.

Production of methane. 4942. Feb. 22. Production etc. of semi-coke etc. 4943. Feb. 22.

Johnson (I.-G. Farbenind.). Manufacture of liquid hydrocarbons from olefines. 5017—8. Feb. 22.

Laing and Nielsen. Distillation of carbonaceous materials. 4842. Feb. 21.

Lessing. Fuel briquettes. 4915. Feb. 21.

Salerni. Apparatus for distillation of carbonaceous materials. 5380. Feb. 25.

Slade, and Synthetic Ammonia and Nitrates, Ltd. Steam distillation of coal etc. 4788. Feb. 21.

Urbain. Simultaneously producing water-gas, phosphoric acid, and high-alumina cement. 5296. Feb. 24. (Fr., 20.1.27.)

Wilberg. Reducing to carbon monoxide, carbonic acid content in gases. 5165. Feb. 23. (Sweden, 27.2.26.)

Wisner. 5410. See I.

II.—Complete Specifications

20,232 (1925). Mount. Continuous filtering. (265,679.)

29,256 (1925). Chem. Fabr. Griesheim-Elektron. Process for the production of methane. (244,076.)

32,419 (1925). Halls. See I.

1684 (1926). Humphreys & Glasgow, Ltd., and Stelfox. Manufacture of gas. (266,108.)

8099 (1926). Gray Processes Corp. Distilling or cracking hydrocarbons and purifying the vapours. (249,871.)

16,162 (1916). Abbott. Low-temperature distillation retort. (266,193.)

19,786 (1926). Neumann and Steinschneider. Distilling mineral oils, tar, and the like. (257,257.)

28,891 (1926). Siemens und Halske A.-G. Gas-testing apparatus. (262,092.)

*23,543 (1926). Collin und Co., and Schaefer. Coking retorts. (266,286.)

*2425 (1927). Gaertner. Converting coal into hydrocarbons. (266,311.)

*4372 (1927). Herzberg. Production of a gaseous mixture from pulverised coal. (266,354.)

III.—Complete Specification

19,786 (1926). Neumann and Steinschneider. See II.

IV.—Applications

Carmichael (I.-G. Farbenind.). Converting cyanaphthalene-sulphonic acids etc. 4887. Feb. 21.

I.-G. Farbenind. Manufacture of dyestuffs. 4844. Feb. 21. (Ger., 20.2.26.)

Diazo-sulphamic acids. 5009. Feb. 22. (Ger., 22.2.26.)

Imray (Soc. Chem. Ind. in Basle). Manufacture of aromatic tetrahydronaphthylamine derivatives. 5245. Feb. 24.

Johnson (I.-G. Farbenind.). Process for production of benzanthrone derivatives. 4841. Feb. 21. Manufacture of *n*-dihydro-1.2.1'.2'-anthraquinoneazine etc. 5020. Feb. 22.

IV.—Complete Specifications

30,024 (1925). Meister, Lucius, and Brüning. Manufacture of azo-dyestuffs and process of dyeing wool therewith. (243,758.)

*4478 (1927). Haller. Manufacture of condensation products of arylamines. (266,358.)

*4844 (1927). I.-G. Farbenind. Manufacture of vat-dyestuffs of the 2-thionaphthene-2'-indolindigo series. (266,382.)

*5009 (1927). I.-G. Farbenind. Obtaining diazo-sulphamic acids of the cyclic series. (266,388.)

V.—Applications

Coles. Production of paper. 5423. Feb. 26.

Naaml. Vennoots. Handelsmaatschappij Fibra. Production of wood pulp. 4880. Feb. 21. (Ger., 5.3.26.)

Nobel Industries, Ltd. (Du Pont de Nemours and Co.). Manufacture of nitrocellulose compositions. 3265. Feb. 24.

Non-Inflammable Film Co., Ltd., and Mallabar. Production of films of cellulose esters. 5272. Feb. 24.

Pathé Cinéma. Manufacture of threads, filaments, etc. 5167. Feb. 23. (Fr., 3.3.26.)

Soc. Chimique des Usines du Rhône. Colouring cellulose esters etc. 5381. Feb. 25. (Fr., 3.8.26.)

V.—Complete Specifications

28,989 (1925). Eichengrün. See XIII.

30,544 (1925). Badische Anilin- und Sodafabr. Preparations for washing and cleaning. (244,104.)

792 (1926). Cadgene. See VI.

10,878 (1926). Marr, and Ramar Syndicate, Inc. Manufacture of pulp or fibrous material. (266,168.)

*704 (1927). Soc. Lyonnaise de Soie Artificielle, and Chevalet. Cellulose product. (266,300.)

*4239 (1927). Soc. Civile des Procédés Masse. Treating stalks of ramie. (266,344.)

VI.—Applications

Farrell. Mercerisation of textile materials. 5334. Feb. 25.

I.-G. Farbenind. Dyeing etc. vegetable fibres. 5008. Feb. 22. (Ger., 22.2.26.)

Soc. des Condenseurs Delas. Dyeing, cleaning, tissues, etc. 5283. Feb. 24. (Fr., 10.11.26.)

VI.—Complete Specifications

30,024 (1925). Meister, Lucius, and Bruning. See IV. 792 (1926). Cadgene. Weighted artificial silk. (259,899.) 10,530 (1926). Naugatuck Chemical Co. See XIII. 21,530 (1926). Callebaut and Bliouy. Dyeing. (266,227.) *4514 (1927). Oberrheinische Handelsges. Treating yarns and fabrics. (266,367.)

*5008 (1927). I.-G. Farbenind. Producing combined shades from sulphur dyes and ice-colours on vegetable fibre. (266,387.)

VII.—Applications

Beckett, Harris, Thomas, Wylam, and Scottish Dyes, Ltd. Sulphuro-anhydride compounds. 5398. Feb. 25.

Carpmael (I.-G. Farbenind.). Manufacture of alkali iodates. 5045. Feb. 22. Manufacture of compounds containing active oxygen. 5046. Feb. 22.

Collin A.-G. Discharging ammonia sulphate from saturating-tanks. 4881. Feb. 21.

I.-G. Farbenind. Treatment of crude nitrate of soda. 5251. Feb. 24. (Ger., 24.2.26.) Treatment of crude nitrates of soda. 5378. Feb. 25. (Ger., 25.2.26.)

Johnson (I.-G. Farbenind.). Manufacture of hydrated chromic chloride. 5019. Feb. 22.

Urbain. Producing hydrogen and phosphoric acid. 5295. Feb. 24. (Fr., 7.12.26.)

Urbain. 5296. See II.

VII.—Complete Specifications

20,231 (1925). Mount. Causticising units or apparatus. (265,669.)

12,681 (1926). Urano and Imai. Manufacture of basic calcium hypochlorites. (266,180.)

12,682 (1926). Urano and Imai. Manufacture of pure calcium hypochlorite. (266,181.)

17,145 (1926). Comp. Gén. des Prod. Chim. de Louvres, and Pipereaut. Manufacturing chromates and manganates. (255,078.)

23,509 (1926). Johnson (I.-G. Farbenind.). Manufacture of copper sulphate. (266,237.)

*2453 (1927). Rosenheim. See XXIII.

VIII.—Applications

Armitage. Unsplinterable glass. 4938. Feb. 22.

Bennion, Clarke, and Plant. Pottery etc. ovens. 5191. Feb. 24.

Quartz et Silice. Manufacture of silica glass articles. 4837. Feb. 21. (Fr., 24.2.26.)

VIII.—Complete Specifications

7686 (1926). Cornelius. See XI.

9449 (1926). Carborundum Co. Manufacture of refractory articles. (266,165.)

13,760 (1926). Jackson (Hartford-Empire Co.). Forming sheet glass. (266,182.)

27,489 (1926). Aluminum Co. of America. Refractory articles. (262,403.)

IX.—Applications

Edser. Waterproofing building etc. materials. 5345. Feb. 25.

Murphy. Material for constructional purposes. 5336. Feb. 25.

Parry, and Parry & Sons, Ltd. Rotary cement kilns. 4889. Feb. 21.

Urbain. 5296. See II.

IX.—Complete Specifications

7686 (1926). Cornelius. See XI.

*32,046 (1926). Rütgerswerke-A.-G. Wood preservatives. (266,296.)

*3906 (1927). Chassevent. Tempering plaster. (266,335.)

*4509 (1927). Aerni. Manufacture of artificial stone. (266,364.)

X.—Applications

Allan, Haguc, and Cammell, Laird & Co. Alloy steels. 5449. Feb. 26.

Harris. Treatment of impure metals etc. 4925. Feb. 21.

McDougal. 4901. See I.

Maybrey, and Stone & Co. Aluminium alloys. 5451. Feb. 26.

Picard and Sulman. Extraction of tin. 5231. Feb. 24.

Selz. Aluminium alloys. 3035. Feb. 22. (Ger., 27.2.26.)

X.—Complete Specifications

28,511 (1925). Rushen (Gelsenkirchener Bergwerks A.-G.). Eliminating phosphorus from pig-iron. (266,033.)

28,762 (1925). Mond Nickel Co., Ltd., and Atkinson. Extraction of precious metals. (266,040.)

28,872 (1925). Würker. Electrolytic separation of chromium. (266,045.)

29,383 (1925). Smith and Garnett. Magnetic alloys. (266,066.)

29,432 (1925). Barrett Co. Flotation agents for use in concentrating minerals. (243,383.)

3894 (1926). Hilbert. Increasing the production and the phosphoric acid content of Thomas slag. (247,946.)

21,320 (1926). Martyn. Wet separation of the constituents of mineral and other pulp. (264,129.)

*26,143 (1926). Smith. Reducing metallic oxides. (266,289.)

*4754 (1927). Siemens und Halske A.-G. Electrodeposition of chromium. (266,370.)

XI.—Applications

Campbell, and General Electric Co. Gas-filled photo-electric cells. 5364. Feb. 25.

Draisma. Leaden plates for accumulators. 5000. Feb. 22.

Féry. Electric battery. 5030. Feb. 22.

Hart Accumulator Co., Ltd., and Schofield. Electrodes of secondary batteries. 5057. Feb. 22.

XI.—Complete Specifications

28,872 (1925). Würker. See X.

7686 (1926). Cornelius. Electric furnaces for melting or producing glass, cement, etc. (249,554.)

8292 (1926). British Thomson-Houston Co., Ltd. Electric furnaces. (249,880.)

25,291 (1926). Internat. General Electric Co., Inc. Electric arc furnaces. (259,615.)

*4598 (1927). Mouillefarine. Dielectric product. (266,370.)

*4754 (1927). Siemens und Halske A.-G. See X.

XII.—Complete Specifications

5858 (1926). Owe. Production of vitaminised oils. (266,139.)

*26,544 (1926). Schou. Manufacture of soap. (266,291.)

XIII.—Applications

British Thomson-Houston Co., Newbound, and Warren. Resinous condensation products. 5407. Feb. 25.

Johnson (I.-G. Farbenind.). Production of coloured masses. 5253. Feb. 24.

Kunstharzfabrik Dr. F. Pollak Ges. Manufacture of phenol-formaldehyde condensation products. 5171. Feb. 23. (Austria, 17.3.26.)

Pollak. Condensation products of carbamide with formaldehyde. 5058. Feb. 28. (Austria, 1.10.24.)

XIII.—Complete Specifications

27,884 (1925). British Cyanides Co., Ltd., and Rossiter. Manufacture of artificial resins. (26,028.)

28,989 (1925). Eichengrün. Solutions for lacquering, impregnating, coating, etc. (243,031.)

10,530 (1926). Naugatuck Chemical Co. Manufacture of waterproofing compositions. (251,961.)

19,500 (1926). Marks (Monk and Irwin). Producing titanium pigments. (266,211.)

19,904 (1926). Takemura and Oiwa. Varnishing preparation. (266,214.)

*5058 (1927). Pollak. Treatment of condensation products of carbamide or its derivatives with formaldehyde. (266,389.)

XIV.—Application

Soc. Ital. Pirelli. Vulcanisation of rubber. 5178. Feb. 23. (Italy, 24.2.26.)

XIV.—Complete Specification

28,698 (1925). K. D. P., Ltd. Concentration of latex. (255,014.)

XVII.—Applications

Farnell. Extraction of sugar from beet. 5071. Feb. 23.

Ott. Treatment of sugar cane. 5151. Feb. 23.

XVII.—Complete Specification

14,759 (1926). Steffen. Extraction of sugar from molasses. (266,187.)

XVIII.—Applications

Johnson (Bücher). Manufacture of yeast. 5352. Feb. 24.

Scott. Apparatus for treating yeast. 4960. Feb. 22.

XVIII.—Complete Specification

20,248 (1925). Kahu and Schaffer. Treatment of yeasts by autolysis. (243,373.)

XIX.—Applications

Bartmann. Treatment of vegetables etc. for recovery of endosperm. 5255. Feb. 24. (Ger., 27.2.26.)

Coles. Production of milk products. 5207. Feb. 24.

Soc. des Moulins de la Coudre. Manufacture of flours. 5041. Feb. 22. (Fr., 25.2.26.)

XIX.—Complete Specifications

30,146 (1925). Nesbitt, Butler, and Drumm. Treating vegetable produce. (266,069.)

5858 (1926). Owe. See XII.

XX.—Applications

Bloomfield, and Boake, Roberts, & Co. Manufacture of acyl halides. 5330. Feb. 25.

Bloomfield, Gower, and Boake, Roberts, & Co. Manufacture of acyl halides. 5331. Feb. 25.

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has

received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Steel blooms (A.X. 4320). *British India*: Steel, iron (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, London, S.E.1): Red and white lead (Madras and Southern Mahratta Railway Co., Ltd., 25, Buckingham Palace Road, London, S.W.1). *Canada*: Steel strip (A.X. 4335): Tiles, sanitary equipment, rubber flooring (C.X. 2217). *Chile*: Asbestos packing, rubber hose, chemical products, hydrochloric and sulphuric acids, alcohol, disinfectant, ferrocyanide of potassium, disinfectant, lubricating and illuminating oils, paint, varnish and painting utensils, iron and steel, metal cables, ingots in antimony, tin, iron, lead and foundry materials, glass, galvanised and black tubes, copper tubing (C.X. 2206). *Colombia*: Air compressors, centrifugal pumps (A.X. 4307). *Finland*: Sugar, cattle foods, fertilisers (216). *Germany*: Drugs, chemicals, medicines, perfumery (219). *Greece*: Tin, tinplate, galvanised sheets (220). *Poland*: Artificial silk (224). *Rumania*: Boiler and gas pipes (A.X. 1316). *South Africa*: Toilet preparations (211): Mild steel boiler tubes (A.X. 4333). *United States*: Steel (A.X. 4262).

Dyestuffs (Import Regulation) Act, 1920

The following statement relating to applications for licences under the Dyestuffs (Import Regulation) Act, 1920, made during February, has been furnished to the Board of Trade by the Dyestuffs Advisory Licensing Committee. The total number of applications received during the month was 498, of which 382 were from merchants or importers. To these should be added 11 cases outstanding on January 31, making a total for the month of 509. These were dealt with as follows:—(Granted 149 (of which 137 were dealt with within 7 days of receipt). Referred to British makers of similar products—12 (of which 36 were dealt with within 7 days of receipt). Referred to reparation supplies available—8 (all dealt with within 2 days of receipt). Outstanding on February 28, 1927—10. Of the total of 509 applications received, 481, or 94 per cent., were dealt with within 7 days of receipt.

EDITORIAL

The Chemical Engineers

THE Chemical Engineers' banquet on Friday last was very good. This is a vague statement, which carries no conviction; we will be more precise. Such a banquet must be considered from two points of view, the actual dining and the post-prandial oratory. So far as the dining is concerned, one Lucilius, many years ago, described a dinner as well-cooked, well-served, with good talk and everyone quite at his ease. That was his idea of what a dinner should be, and no bad idea either. Well, we were fortunate enough to get all this on Friday; having had what was once described as "a dinner not severely plain, a pint or so of really good champagne," let us consider the after-dinner speaking. This is a difficult matter; after-dinner speeches should neither be too serious nor too frivolous; after a few oysters, soup, fish, and what-nots, you do not care to face those who, with fire in each eye and papers in each hand, are forced to speak or burst, nor does the scientific mind desire that the jests be obviously dragged in and fit badly into their surroundings. Many of us have been educated at great expense; think of what our parents contributed, and of what we then endured! how did the Oxford classical don put it? "Think of the claims of the Natural Sciences, all of them rolling their separate logs; think of the millions we spend on appliances, chemists and botanists, rabbits and frogs." We who have had these experiences rightly regard ourselves as the salt of the earth, and we should be treated accordingly. On Friday we were treated accordingly; the speeches were really good: Sir Herbert Samuel is a finished speaker; he is skilful and pleasant, and has an agreeable voice and something to say; he should be kept in mind and his name marked with a white stone; we should like to hear him more frequently. All the other speeches were good; we wish we had space to comment on many of them; they deserve a better fate than either our comments or our lack of them; still, we intend to take note of a few observations by Sir Arthur Duckham, who discussed the education and training of the chemical engineer. He is after men who have an adequate knowledge of the fundamentals of their science with administrative ability to back it up. He has a difficulty in finding them; we are not surprised; it is no light task to know the fundamentals of chemical engineering, and it is given only to a few men to have administrative ability. Sir Arthur would like a closer touch during

the training of the student between the university and the industry. He would like the student to visit the industry and the industrialist to visit the university; he would like the teacher to visit the industry and the industrialist and the teacher to confer together on the training of the chemical engineer. Of course, the chemical engineers are not chemists; they are not quite so salty as we are; we feel, except when the prospect of their dinner is immediate or our recollection of it fresh, the difference between us, and yet it is possible that they will grapple with this problem more speedily, will, in fact, set about the work with no proper deliberation, and do it. They seem to have a knack of doing the thing somehow, and doing it quickly and doing it very well. Why, they have only been going four or five years, and they are already getting ahead with great rapidity. Well, let us not be envious, nor ungrateful; we spent a very pleasant evening and heard some very good speeches. Sir Frederic Nathan is to be congratulated, not only on two years of progress during his Presidency, but on a closing ceremony which was very distinguished and worthy of emulation.

Chemical Trade with the Empire

The range and quality of British chemical products recently exhibited at the British Industries Fair give us just cause for satisfaction, a satisfaction which is subscribed to by Empire and foreign buyers in a very practical fashion. At the same time we cannot chase away from our mind some speculations as to the future of chemical trade with the countries of the Great Commonwealth. Chemicals play such an important part in the complex civilisation of to-day, and, in the stages of settlement and development which follow colonisation, it is natural that the Empire should look to British factories for essential materials. It is a feeling which should be encouraged in every possible way. But it is natural, too, that as a country progresses to full development, an internal supply of necessary chemicals be demanded and created. Nowhere is this better demonstrated than in Canada, which is fast becoming almost self-supporting in the matter of chemical supplies. In 1925, the year in respect of which the latest figures are available, Canada produced over £20,000,000 worth of chemicals, and only imported from this country and the United States—the main sources of imported chemicals—£5,000,000 worth. She produced about £4,000,000 worth of paints, pigments and varnishes, and

a like amount of soaps, washing preparations and toilet preparations. £2,500,000 worth of medicinal and pharmaceutical preparations were made within the Dominion as well as a like amount of explosives, ammunition and matches. The heavy chemical industry, called into being in large degree by the virile and ever-expanding paper industry, produced over £5,000,000 worth of acids, alkalis and compressed gases, whilst fertilisers, adhesives, celluloid, artificial leather, insecticides, dyes, coal tar products, and wood distillation products were manufactured in smaller but by no means inconsiderable quantities. New industries sprang into existence in 1926, and more are contemplated during the present year. A large plant for the manufacture of cellulose acetate silk is being erected in Quebec, and the enterprising Canadian Electro Products Co. is entering new fields in the production of synthetic solvents for the new pyroxylin lacquers. We had the opportunity of observing from a privileged position the development of the manufacture of synthetic acetic acid and acetone from calcium carbide, via acetylene and acetaldehyde, during the war years, and if such efforts of the Electro Products Co. are typical of the Canadian chemical industry the Dominion is truly blessed. The production of heavy chemicals within the countries of the Empire may render it difficult, then, for British manufacturers to compete, especially in view of the high transport charges, and it is all the more gratifying to find that the proportion of our alkali exports going to the Empire countries has been well maintained in recent years. There is, perhaps, a greater opportunity for English makers of fine chemicals and speciality products and for chemical plant manufacturers. It is with no disrespect to overseas chemists that we say that such materials as synthetic thyroxin, borocaine, soluble vat dyestuffs, "levelling" dyes, insulin and the like can probably be made more cheaply in the home country, where research and production are more concentrated and the interworking of factories grouped within great organisations facilitates the development and economical prosecution of new processes. British chemical plant manufacturers are coming to the fore with plant for the carrying through of chemical engineering unit processes, so that filter presses, centrifuges, stills, evaporators, grinding mills, driers, pumps, and much else should find their way not only into Empire chemical factories, but also into sugar works, mining establishments, oil extraction mills, and a host of works devoted to general industrial operations throughout the Empire. By intensive propaganda, true salesmanship, and a study of specific requirements, British manufacturers may well hope to capture a greater proportion of those orders which the countries of the Empire find it necessary to place without their own borders. In spite of the nearness of the United States to Canada, it should be possible for this country to place more chemical products in the Dominion. In 1926, Canada imported more than £4,000,000 worth of chemicals from the States and only spent £1,000,000 in this country. The technical and commercial strength of the British chemical industry has been well displayed in the difficult times of the past few years, and we have every confidence that the problems of the future will be faced with that courage and enterprise which won general approval during the dark months of 1926.

LIQUID CHLORINE—ITS MANUFACTURE AND USES*

By D. A. PRITCHARD and J. H. HUBEL†

The two essential factors in selecting Sandwich, Ontario, as the site for the electrolytic plant of the Canadian Salt Company were cheap salt and cheap power.

Salt.—Underlying the south-western part of Ontario and portions of Michigan are salt deposits of vast extent in the salina formation of the Silurian age. The approximate area of this salt basin in Canada alone is about 3,000 square miles. These beds vary in thickness from 30 to 230 ft., the upper and thinner layers being interstratified with dolomite and shale. To give some idea of what this deposit means, a square mile of it, 250 ft. deep, would contain over 400 million tons.

Power.—The Sandwich Plant is at the extreme western end of the Ontario Hydro-Electric Commission's distribution of Niagara Falls power, there being 276 miles of transmission lines between Windsor and Niagara Falls stations. The energy is brought to Windsor at 110,000 volts and delivered at 26,400 volts to the plant, where it is converted to direct current at 250 volts. The company takes 4000 h.p. from the Commission and can generate as much as 8000 h.p. by means of its modern power plant. The last addition to the power plant consists of 700 h.p. powdered-fuel fired, 350-lb. pressure boilers in conjunction with 2000 h.p. Parsons turbo-generators. The fuel supply is brought in by boat and unloaded at the company's own docks on the Detroit River.

THE BRINE AND ITS ELECTROLYSIS

The first salt is struck at 1000 ft., but drilling is continued until the "deep salt" is reached at 1600 ft. Two iron pipes, one within the other, are run the full length of this drill hole. Water is forced down between the outer casing and inner pipe and the concentrated brine is brought to the surface in the smaller pipe. Before this brine can be utilised it must be treated to remove lime salts, which would otherwise precipitate in the diaphragm and thereby increase the resistance of the electrolytic cell. This purification is accomplished by first heating the raw brine to 180° F. and mechanically adding the calculated amount of sodium carbonate solution. The resulting precipitate of calcium carbonate is settled out by means of Dorr thickeners, and the clear, hot brine is fed automatically and by gravity to the electrolytic cells, where it is decomposed into sodium and chlorine. This sodium, in turn, reacts with excess water present to form a dilute solution of caustic soda with the evolution of hydrogen.

The electrolytic cells used at Sandwich are of the cylindrical diaphragm type, and are the invention of an Englishman, Arthur E. Gibbs. The process is one of the most efficient of its kind in operation to-day. A large plant consuming about 10,000 h.p. is located at Wyandotte, Mich., and possibly the largest installation in the world to-day is that of the United Alkali Company of Great Britain, both using the Gibbs cell.

* Paper presented before the February meeting of the Montreal Section.

† Works Manager and Chief Chemist respectively of the Canadian Salt Company, Limited, Windsor, Ontario.

The cell itself is enclosed in an upright iron container, cylindrical in shape, and is assembled by placing inside this container a cylindrical and perforated cathode sheet on the inner side of which is secured a diaphragm of a special grade of long-fibre asbestos paper. Inside the cylindrical cathode and as near to it as practicable are placed 24 graphite sticks, 2 by 2 by 36 in. long, suspended in a circle from a dome-shaped head. The head, the ring it fits, and the bottom around which the cathode with its diaphragm is formed are made by the company from a mixture of cement and asbestos. The joints between the various divisions of the cell are so designed that they can be made gastight by a chlorine-resistant putty. These cells are arranged in a series of 70 individual cells placed in two parallel rows of 35 each, and are connected so that the current must travel in series through the whole 70 under an applied voltage of 250 volts. Each cell will take approximately 3.57 volts and a current of 1000 amperes. Practically the only

LIQUID CHLORINE

Although liquid chlorine has been made by the compression system for many years, it has been by the so-called tower system that the recent expansion of the industry in Canada and the United States has been brought about. Chlorine derived from the cells is drawn through a cooler and thence through two 40-ft. drying towers, counter-current to a flow of strong sulphuric acid to remove the moisture from the gas. The cooler and tower remove at a maximum 50 lb. of water per ton of gas passing through them. This renders possible the liquefaction of the gas in iron equipment, for dry chlorine does not attack iron. Induced from the drying equipment by a Nash pump operating in sulphuric acid, the dry gas is delivered to the towers of the liquefying plant at a pressure above 3 lb. It is there entrained through a suitable suction head with a falling column of strong sulphuric acid contained in a 4-in. line, or "leg," as it is called. Falling through a distance of 90 ft. into a

Sandwich plant of the Canadian Salt Company

departure from the original design has been in the manner of feeding the brine. By an ingenious arrangement, the cell is kept full of hot brine and at the same time the continuity of the brine fed to the cell is broken in an effective manner, thereby eliminating current losses.

The chlorine gas generated is removed through a stoneware pipe into a gas main kept under slight suction. The caustic soda, together with some undecomposed brine, trickles down the outside of the cathode sheet to the bottom of the cell container and thence through a receiving line into storage tanks, which supply the evaporator department.

The cell operates at a current efficiency of 93-95% over the anode life of better than a year, a power efficiency of 56-57%, and a voltage efficiency of 60-61%. It will produce in 24 hrs., per square foot of floor space taken, 5 lb. of caustic soda and 4.43 lb. of chlorine. The caustic will run 120 grams per litre of sodium hydroxide, and the chlorine 95% or more. The cell itself is remarkably simple, whilst the ease of its assembling and replacement does not demand expensive labour in building or supervising while in operation.

compression chamber, the gas pressure is increased to 35 lb. per sq. in. gauge, or 50 lb. absolute, the acid continuing its cycle. Under this pressure the gas rises through double cooling coils kept at $-25^{\circ}\text{C}.$, and is liquefied. The liquid chlorine runs from the cooling coils by gravity through a trap to remove all non-condensable gases, then into an insulated steel vessel, the capacity of which is about 5000 lb. From this it is loaded either into storage tanks, 15-ton tank cars, or 150-lb. cylinders, by air under 100 lb. pressure, which is previously dried by passing through a series of towers containing strong sulphuric acid.

USES OF LIQUID CHLORINE

Chlorine, at ordinary temperature, is a greenish-yellow gas with a characteristic suffocating odour. It has an atomic weight of 35.45, and is about two and a half times as heavy as air. Liquid chlorine is of golden-yellow colour, and entirely free from the greenish tint possessed by the gas. It has a specific gravity of 1.469 at $0^{\circ}\text{C}.$, weighing approximately 90 lb. per cu. ft. Liquid chlorine boils at $-33.6^{\circ}\text{C}.$ and when confined

at a higher temperature will build up its own pressure until it ceases to boil. The tanks used for transporting this commodity thus carry a pressure of about 100 lb. per sq. in. at ordinary summer temperature (78° F.).

When liquid chlorine is cooled to below -102°C . it becomes an almost colourless solid, crystallising in the rhombic system.

Chlorine does not burn, but supports the combustion of some burning bodies. It reacts chemically with most metals, under favourable conditions, to produce chlorides. At high temperature its action is particularly rapid. It is a curious fact that practically no action will take place when chlorine is completely freed from aqueous vapour. If dry chlorine is allowed to enter a flask filled with "Dutch metal" (cheap imitation of gold leaf made from an alloy of copper and zinc) no action takes place, but on the introduction of the smallest trace of moisture the metal at once takes fire. This particular property is of great importance to the chlorine industry,

Part of the cell room

as once the gas is dried it can be conveniently handled in iron pipe, tanks and other apparatus.

As to the commercial uses of liquid chlorine, it is estimated that about 65% of the chlorine gas manufactured in the United States and Canada is consumed by the pulp and paper industry—that 22% is consumed in the textile industry; 10% in sanitation; and the remaining 3% in all other uses. We will try and cover some of the more important uses, touching briefly on those of less importance, or at least those using a small percentage of the total gas produced.

CHLORINE IN THE PAPER INDUSTRY

Wood pulp, regardless of the process by which it is made, requires bleaching before it can be used for the production of white or light-coloured papers. In the sulphite, or soda process, a portion of the lignin always remains in the pulp, and this lignin always carries coloured bodies of highly complex chemical composition. These coloured impurities cannot be removed by washing

or mechanical treatment, because they are united chemically with the fibre, and therefore require a chemical process for removal.

The bleaching process is essentially an oxidising reaction, and this is shown by the fact that many materials become bleached by simply exposing to the wind and sunshine. Chlorine, when brought in contact with water, releases the oxygen from the water. This nascent oxygen reacts with the hydrogen of the colouring matter to yield colourless compounds which produce the bleaching effect. In practice, calcium hypochlorite is used for this purpose, because solutions of comparatively high concentration may be obtained. It is the available oxygen, then, in the formula, $\text{Ca}(\text{OCl})_2$, which does the work.

In practice, the washed pulp from the digesters is treated with a solution of calcium hypochlorite in a modern bleaching machine, such as the Thorn, Fletcher, or Bellmer bleacher. The bleach solution is made by simply passing liquid chlorine—piped direct from a tank car—into a reaction tank containing milk of lime. These are usually vertical, cylindrical concrete tanks, having a capacity of about 1500 cu. ft. Circulation is maintained by either a mechanical paddle agitator or a centrifugal pump. This reaction will proceed at a rate approaching one ton of liquid chlorine per hour, without gas escaping at the surface of the liquid. Chlorination is allowed to continue until the lime has been practically used up, and the strength of the solution is about 35 grams of calcium hypochlorite per litre. The chlorinated solution is then pumped to a settling tank, in which the excess lime settles out, leaving the finished clear solution ready for the bleaching machine.

The old method of making bleach liquor, and the one still in use by many of the smaller mills, is to add bleaching powder (chlorinated lime) to water, agitate, and allow to settle. This gives exactly the same compound, but bleaching powder is messy stuff to handle, it deteriorates rapidly, and the sheet steel drums are bulky and difficult to dispose of. Liquid bleach made from liquid chlorine, on the other hand, is more economical, more efficient, due to more neutral solutions being obtained, and contains less sludge to handle.

About 7% of chlorine is required to bleach pulp. This varies more or less, depending upon the wood and the method of cooking the fibre.

In 1926, over 300 fifteen-ton liquid chlorine tank cars were in pulp mill service in the United States and Canada. The Canadian Salt Company owns and operates in Canada about one-fifth of these tank cars.

CHLORINE IN THE TEXTILE INDUSTRY

The theory of bleaching cotton and linen is quite similar to the bleaching of wood pulp—all being pure cellulose. The bleaching of these textiles involves two general steps in procedure: first, a removal of the fatty and waxy matters on the fibre, and, second, a destruction or removal of the colouring matter. If the waxy matters are not first removed by boiling in dilute alkali, they will tend to resist the action of the bleaching agents. Whilst other oxidising agents are sometimes used, the use of hypochlorite is favoured for bleaching because of cheapness, efficiency, and lack of injury to the fibre.

Either calcium hypochlorite or sodium hypochlorite serve the purpose, and are made by chlorinating milk of lime or caustic soda, as the case may be. Sodium hypochlorite is doubtless more desirable than calcium hypochlorite, because it is a more soluble salt. In using calcium hypochlorite lime salts are precipitated in the fibre, and if the "souring," or acid wash, which follows is not complete, a harsh fabric results. Sodium salts, on the other hand, are easily washed out, very little acid is required, and a soft feel is imparted to the fabric.

The soda bleach solution is conveniently made by dissolving a definite quantity of caustic soda in a tank and adding the weighed molecular quantity of liquid chlorine from a standard cylinder resting on a platform scale. The operation is very simple, and requires no chemical control.

We might say that liquid chlorine is far more desirable than chloride of lime for textile mills as it is clean, there is no dust, very little odour, no sludges to handle, and in the long run it is more economical.

Large quantities of sodium hypochlorite made in the above manner are used for bleaching in laundries and in the household under the name "Javelle Water." And while speaking of sodium hypochlorite, it may be mentioned that "Dakin-Carr" solution, the antiseptic used almost exclusively in the base hospitals during the late war, was a 1% solution of sodium hypochlorite. This solution is used to-day in practically all the important hospitals in the country. Its chief advantage over other antiseptics is the fact that it not only sterilises the wound but dissolves necrotic tissue as well. This results in very rapid healing. Sodium hypochlorite was also instrumental to a large degree in stamping out the spread of foot-and-mouth disease prevalent in England in 1923, and is commonly used on farms for general sterilisation.

(To be continued.)

INDUSTRIAL NOTES FROM CANADA

A large plant is being erected in Quebec for the manufacture of industrial alcohol. Molasses storage tanks of 3,600,000 gallons are completed. The plant will have a capacity of 9000 proof gallons daily.

Reports reaching Winnipeg indicate that oil has been struck for the first time in Manitoba, near Grandview, Manitoba. According to Mr. Walter T. Ross, oil operator, of Billings, Montana, the Number One well on the Balak lease is flowing 35 to 40 barrels per day. Partial tests indicate that the oil is paraffin base, with high gasoline content. Oil has been struck at the shallow depth of less than 1000 ft.

A fourth big oil well is reported in the Turner Valley field, southwest of Calgary. The McLeod No. 2 well is now producing between 5 and 6 million cb. ft. of wet gas. The well has not been connected to a separator yet, consequently the gasoline content is not definitely known, but is reported at 150 to 200 barrels per day. The other producing wells in this field are Royalite No. 4, Vulcan and Illinois-Alberta. The original wonder well, Royalite No. 4, has been producing 500 barrels of naphtha and 17,000,000 cb. ft. of gas per day for upwards of two years, and its flow shows no diminution.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

ANNUAL GENERAL MEETING, JULY 4 to 8, 1927

RAILWAY FACILITIES

The Railway Companies of Great Britain (except the Metropolitan, the Metropolitan District, and London Electric Railway Companies) have agreed to issue tickets at the ordinary single fare and one-third for the double journey to persons travelling to Edinburgh to attend the meeting. Tickets will be available from Saturday, July 2, to Saturday, July 9.

It is urgently requested that all persons going by rail to Edinburgh for the meeting will take advantage of this concession.

ANNUAL REPORTS OF THE PROGRESS OF APPLIED CHEMISTRY—VOL. XI.

This volume of the Annual Reports (covering the year 1926) is now ready, and copies have been despatched to those who have subscribed for them.

The price of the volume is 7s. 6d. to members of the Society and 12s. 6d. to non-members. Fellows of the Chemical Society, who are not members of the Society of Chemical Industry, can purchase the book at the price of 10s.

Orders for copies, accompanied by the appropriate remittance, should be sent to the General Secretary of the Society.

CHEMICAL SOCIETY'S LIBRARY

Members of the Society of Chemical Industry are reminded that they are entitled to consult the Library of the Chemical Society, Burlington House, Piccadilly, W.1, and to borrow books therefrom.

The Library is open daily from 10 a.m. to 9 p.m. Saturdays from 10 a.m. to 5 p.m. The Library is closed on Bank Holidays, the day following, and on other such occasions as the Council may direct.

LIST OF MEMBERS ELECTED

March 11, 1927

- Archibald, Peter K., 12, Armadale Street, Glasgow. E. Junior Works Chemist.
- Bassett, H. Norman, "Redville," High Street, Swindon, Wilts. Assistant Analyst.
- Crossley, Dr. Moses L., c/o Calco Chemical Co. Library, Bound Brook, N.J., U.S.A. Chief Chemist.
- Duncan, John R. M., 9, Norse Road, Scotstoun, Glasgow. Chemist.
- Frank, Prof. Dr. Fritz, Lützowstr. 96, Berlin, W.35. Chemist.
- Fitzpatrick, Alfred S., Australia House, Strand, London, W.C.2. Research Chemist.
- Fuerst, George M., 17, Philpot Lane, London, E.C.3. Chemical Merchant.
- Fulford, Sydney B., 89, Hamilton Road, Brent, London, N.W.11. Research Chemist.
- Gee, Jack H., 9, Chichester Terrace, Brighton. Produce Merchant.
- Harrison, Sir Cecil R., K.B.E., Woodcote, Chislehurst, Kent. Chairman of Messrs. Harrison & Sons, Ltd.
- Hazeldon, John N., c/o Coal Oil Extraction Ltd., Aldwych House, Aldwych, London, W.C.2. Chemist.

Hubball, Wilfrid, "Dolwen," 49, Heaton Road, Withington, Manchester. Research Chemist.

MacEwan, James U., Galotta, Ontario, Canada. Metallurgist.

Spooner, Walter, c/o 86, Whiteley Street, North Road, Clayton, Manchester. Analytical Chemist.

Steuart, Daniel W., c/o Maypole Margarine Works, Ltd., Southall, Middlesex. Chemist.

Strong, Howard W., Dept. of Chem. Tech., Imperial College of Science, S. Kensington, London, S.W.7. Research Chemist.

Watson, Sidney G., c/o W. C. Holmes & Co., Ltd., Whitestone Iron Works, Huddersfield, W. Yorks. Chemical Engineer.

Wild, Leonard, 65, Balliol Road, Bootle, Liverpool. Chemist.

BIRMINGHAM AND MIDLAND SECTION

Mr. H. W. Rowell gave a lecture on "The commercial synthetic resins and their products," at the meeting on March 7.

The manufacture of synthetic resins, said Mr. Rowell, has become a chemical industry of such commercial importance that the volume of its demand for raw materials affects their market price. A resin may be prepared by heating under a reflux condenser one molecular equivalent of crystal carbolic acid with one molecular equivalent of 40% formaldehyde solution. After several hours the condensation is complete, and the mixture separates into an upper watery layer and a lower resinous layer. Acids, alkalis and salts which act as electrolytes, catalysts, or condensing agents may be added to the mixture. They considerably shorten the time of reaction, and may produce resins having different practical use or final properties. In practice, synthetic resins are made from synthetic phenol and synthetic formaldehyde, thus making the product truly synthetic. The "treacle" "primary" or "A" resin thus produced is separated from the watery layer and dried by heating under vacuum. It is a sticky viscous mass, either clear or translucent, soluble in alcohol and acetone, but not in benzene or petrol. If this "treacle" is further heated under controlled conditions it polymerises to the "resin" or "B" stage, when it has the appearance of common resin, melts to an extremely viscous mass at temperatures below 80° C., and is still soluble in alcohol and acetone. The "final," "baked," or "C" stage is produced by still further heating and polymerisation, when it becomes insoluble in alcohol and acetone, and does not soften when heated.

The "final" state of the various phenol-aldehyde resins may exhibit some difference in hardness, softening with heat or solvents, and other physical properties, but generally speaking they do not soften on heating, are not decomposed at temperatures lower than 350° C., are insoluble in all the usual organic solvents, acids, alkalis and chemical solutions, except concentrated nitric and sulphuric acids and caustic solutions. Strong caustic soda will dissolve them, and they may be re-precipitated on the addition of acid.

When cresols are used to replace phenol the resulting final product is generally softer and more flexible. Orthocresol alone combines more slowly with formaldehyde, and by incomplete combination produces this softness and flexibility. When mixed cresols are used

together with phenol the reaction is even more difficult to follow, but technical observation of the properties of the variety of resin-like bodies it is possible to make from phenol and formaldehyde leads to the conclusion that a number of reactions go on side by side.

Methods of producing flexible or elastic final products of phenol-aldehyde resin have been suggested which are based on the addition of substances which either dissolve or are dissolved in the hard baked final resin. No really flexible product has been produced commercially, because whilst these added substances produce flexibility, they reduce melting or softening point, reduce tensile strength, or otherwise damage the good properties of the resin.

Oil-soluble resins of the phenol-aldehyde type have been sought for varnish work, and large amounts of air-drying or "cold" lacquer and stove drying or "hot" lacquer are used in the light metal trades. Phenol-aldehyde resins are not suitable for metal lacquering, but are suitable for papier maché and similar work. One of the Albertol modifications is said to produce a good lacquer. A new phenol-urea-formaldehyde lacquer removes entirely the faults of the phenol-aldehyde type and seems to be a decided advance in protective lacquer work.

A solution of phenol-aldehyde resins in alcohol and acetone is largely used for treating taped or cotton-covered wires in electrical apparatus. A thiocarbamide resin is prepared from formaldehyde and thiocarbamide.

In his concluding remarks Mr. Rowell said the original search for synthetic varnish resins has resulted so far only in the modified phenol-aldehyde type called Albertols, the coumarone resins, and an insignificant supply of shellac substitutes of various composition and special application. The production of these resins, compared with the consumption of the natural resins, is quite small, and there is room for the discovery of something more satisfactory for varnish manufacture. Over 90 per cent. of the synthetic resin manufactured is of the phenol-aldehyde type, and new applications, modifications and increased output are frequently registered. Except for the light colour of the thiocarbamide resins, no competition is in sight. There is still a demand for a new synthetic material which has all the properties demanded by the electrical engineer, and also for a transparent, colourless, synthetic material which can replace plate glass.

LONDON SECTION

Dr. Bernard Dyer presided at the meeting on March 7, in the absence abroad of the Chairman, Mr. C. S. Garland.

Prof. W. E. S. Turner, Head of the Department of Glass Technology, Sheffield University, gave a lecture on "Recent progress in the glass industry," in which he dealt mainly with the economic aspect and touched briefly upon recent technical developments and present lines of progress. Giving figures of the distribution of glass factories throughout the world, he showed that Germany heads the list with 383, and the United States comes second with 310. Great Britain has 115 factories. Figures of employees in the glass industry in the various countries of the world showed that Germany again heads the list, with the United States second, and England and Wales third. In analysing the trend of imports and

exports of glass in relation to Great Britain, it was shown how, in 1850, we were distinctly an exporting country, whereas since then the ratio of exports to imports had declined, until to-day it was a very low figure, owing to the flooding of this country with cheap glass from the Continent. Thus the ratio for 1926, although slightly better than in the previous years, was still at a very low level. On the other hand, curves showed that the exports of Germany had been continually rising since 1870. The only satisfactory feature was that the exports of glass from this country had shown a tendency to go up. Curiously enough, the export of optical glass from Germany had not recovered its pre-war position, and was very much less in 1925 than in 1913. Amalgamations of firms had taken place in the optical glass trade in Germany, and to-day there was practically only one firm. In Great Britain there were three factories to-day producing optical glass. As regards chemical glassware, Great Britain held a rather high position in the list, being second to the United States, although manufacturing a much less quantity than the United States.

After referring to the influence of the war upon the glass industry, Prof. Turner mentioned that developments have been taking place in Canada, where there are now eight factories in operation; in Australia, where activity is being shown in the manufacture of bottles, and a big combine of manufacturers has taken place with a capital of over £2,000,000; in South Africa and in India, although very slowly in the latter case. The glass industry had also been established in South America, whilst, as a result of the war, considerable progress had been made in Japan, for window and sheet glass and particularly bottles. In 1925 Japan produced something like 250 million beer bottles.

The next very important influence had been the use of automatic machines in the glass industry, which had reduced the number of factories and employees, whilst at the same time increasing the output. These developments in automatic machines had called for better refractories, and a vast amount of work had been done in that direction, so that whereas at one time refractories for the glass industry did not last for more than 5 or 6 weeks, 10 or 11 months was now fairly good, whilst under certain conditions refractories had been known to stand up for three or four years. A development in America was the electric fusion of the blocks of the refractory material used in the furnaces instead of cementing them together with some heat-resisting cement. Whether this would be economic remained to be seen, but actual commercial production was about to begin.

Prof. Turner then dealt with the manufacture of electric lamp bulbs, and discussed various types of bottle-making machines. An illustration was also given of a glass tube drawing machine, capable of drawing 200 ft. per minute. It was shown how the manufacture of window glass has been largely mechanised.

Chemical glassware is not yet made by machine, although there are processes in America whereby flasks and beakers can be produced in this way. Considerable developments in chemical glass, however, are certain in this country, which is regarded as in an advantageous position because we have a wider choice of first-class chemical glassware manufactured here. This British

glass is very much superior to that which came from Germany. In regard to chemical glass and optical glass we had an advantage in this country of a tariff under the Safeguarding of Industries Act which had stimulated both industries. As regards optical glass, the development that had taken place was seen in the fact that, whereas Messrs. Chance Bros. only had 26 types before the war, they now have 112.

Finally, Prof. Turner referred to the facilities available in this country and elsewhere for training in glass technology, and concluded by emphasising the fact that the position of the British glass industry, both technically and commercially, has vastly improved from what it was in 1913.

An interesting discussion followed, in which Dr. Monier Williams, Dr. Cox, Mr. Collett, Mr. Gallimore, and Mr. Brewis took part. Mr. Redfern, of Messrs. John Lumb & Co., Castleford (Yorks), said that his firm had developed a bottle-making machine which he claimed to be the best in the world. At the moment they had in course of manufacture a bottle-making machine capable of producing 40 million bottles a year, which was to be sent to the largest firm in the East, viz., the Mitsubishi Shoji Kaisha, Ltd. This machine was of the suction type, and he claimed that this is the best type for producing first-class bottles. He maintained that it is a standing disgrace to this country that further efforts had not been made to produce a bottle-making machine here. In all the bottle-making factories in this country there were American machines.

Mr. Hancock said that only those intimately acquainted with the manufacture of glass could appreciate the enormous amount of information given by Prof. Turner, and the extraordinary amount of hard work that had been involved in getting the results he had mentioned. All this was due to scientific research, and particularly so in relation to refractories, for the production of high-quality glass was intimately bound up with the existence of a thoroughly satisfactory refractory material. We could go away encouraged by the statement of the best authority on glass in the country that the British glass industry is being developed on the best scientific lines, and is showing a considerable amount of development.

Prof. Turner, replying to a question raised by Dr. Monier Williams, said that the amount of boron in chemical glass had to be very carefully regulated. Otherwise it would do harm. The limit might be put at 5 per cent. or 6 per cent. Mr. Collett's reply to Dr. Cox stating that the skill of the operators in this country had not deteriorated was correct. At the same time, in some countries the workers had an instinct for glass manufacture which did not exist in others, and from that point of view, perhaps, our operators were not quite so skilful as the Belgian glass workers. They had an intuition for the work which was very wonderful. This also was preserved in Czechoslovakia and in Germany, but even in Germany he had been told that the skill of the workers had considerably deteriorated since the war, just as we had complained of deterioration of craftsmanship in this country. He did not think the showing of the mould marks on moulded and turned bottles was due to the refusal of the men to make the extra turn, as suggested by Mr. Brewis. It was due to

the fact that the methods adopted on the Continent for preventing the mould marks from showing were not adopted in this country. At the same time, bottles could be obtained here without showing the mould marks. As to the bottle-making machine referred to by Mr. Redfern, it certainly was a credit to him and his firm. He agreed with Mr. Redfern that it is a great pity that not only we in this country, but even also Germany, seemed to be looking to America to make good the deficiencies in the glass industry so far as mechanical devices are concerned. There was no real native development going on in Germany, and Mr. Redfern had furnished us with a striking example of what the Britisher ought to do. Replying to Mr. Gallimore, there was no difficulty, in respect of melting, in substituting barium carbonate for soda ash, and a considerable amount of work was done in Germany during the war because of the shortage of soda ash. The adoption of it, however, was not very widespread, and it was never added to the extent of more than a very few per cent. For a considerable time he believed that soda ash would be used for 90 to 95% of the glass manufactured on automatic machines, because of the fairly high rate of change of the viscosity which enabled the machine to manipulate the glass satisfactorily and get a satisfactory distribution of the glass in the article. He could not, off-hand, give Mr. Brewis the analysis of costs that he had asked for, but most of the large glass works now had their costing departments and worked out the items in very great detail. Similarly, with regard to chemical glass he had no means now of comparing the practice of Continental firms in supplying special shapes with what it was before the war. The conditions had changed in Germany considerably, but as wooden moulds were used in many cases in preference to metal moulds it should not be difficult for the user to provide his own mould when he wanted special shapes. The pear wood used was more easily available in this country than in some of the country districts on the Continent. As to the high cost of optical glass, it must be remembered that the glassmaker was lucky if he got 20% of his melt available in a form in which it could be used. It certainly seldom rose above 30%, and that naturally affected the price.

CALENDAR OF FORTHCOMING EVENTS

- Mar. 18. CHEMICAL ENGINEERING GROUP AND THE INSTITUTION OF CHEMICAL ENGINEERS.** Joint meeting with the Coventry Engineering Society, Coventry Technical Institute, at 7.45 p.m. "The importance of chemistry to the engineer," by Prof. J. W. Hinchley. At 3 p.m. a visit will be paid to the works of Messrs. Morris Motors, Ltd.
- Mar. 18. BIOCHEMICAL SOCIETY.** University College, Gower Street, W.C.1. (See CHEM AND IND., Mar. 11, p. 215.)
- Mar. 21. INSTITUTION OF THE RUBBER INDUSTRY, Sales Section.** Engineers' Club, Coventry Street, W.1. at 8 p.m. "What constitutes a good traveller," by F. W. Moore.
- Mar. 22. INSTITUTE OF METALS, Birmingham Local Section.** Engineers' Club, Waterloo Street, Birmingham, at 7 p.m. "Nickel-iron and related alloys," by W. T. Griffiths. (Arranged by the Co-ordinating Committee.)
- Mar. 22. ROYAL PHOTOGRAPHIC SOCIETY, 35, Russell Square, W.C.1, at 7 p.m. Scientific and Technical Group.** Annual General Meeting. "Flame and the photography of flame," by O. C. De C. Ellis.
- Mar. 22. SOCIETY OF CHEMICAL INDUSTRY, Birmingham and Midland Section.** University Buildings, Edmund Street, Birmingham, at 7.15 p.m. "The removal and recovery of phenols from ammonia sulphate still effluents," by D. W. Parkes.
- Mar. 22. INSTITUTION OF PETROLEUM TECHNOLOGISTS.** Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m. *Annual General Meeting.*
- Mar. 22. SOCIETY OF CHEMICAL INDUSTRY, South Wales Section.** Annual Meeting. Technical College, Cardiff, at 7 p.m. Address by W. J. Cooper.
- Mar. 22. MANCHESTER STEAM USERS' ASSOCIATION.** Annual General Meeting, 9, Mount Street, Albert Square, Manchester, at 3.45 p.m. At the conclusion of the meeting the members will be invited to visit the Museum, which contains many items illustrating the causes of boiler accidents.
- Mar. 24. SOCIETY OF CHEMICAL INDUSTRY, Edinburgh and East of Scotland Section.** Annual Sectional Meeting. The North British Station Hotel, Edinburgh, at 7.15 p.m. At 8 p.m., a meeting will be held jointly with the Edinburgh and East of Scotland Section of the Institute of Chemistry, when a paper on "Fire risks in industry" will be read by A. M. Cameron.
- Mar. 24. CHEMICAL SOCIETY.** Annual General Meeting, Burlington House, Piccadilly, W.1, at 4 p.m. Presidential Address on "Experiments on molecular complexity," by Prof. H. Brereton Baker. The Longstaff Medal for 1927 will be presented to Prof. R. Robinson, and the Harrison Memorial Prize for 1926 will be presented to Dr. C. R. Harrington. The Anniversary Dinner will be held the same evening, at 7 for 7.30 p.m., in the King Edward VIIth Rooms, Hotel Victoria, Northumberland Avenue, W.C.2. Among the distinguished guests present will be the Presidents of the French, German and Italian Chemical Societies.
- Mar. 25. CHEMICAL ENGINEERING GROUP.** Joint meeting with the Institution of Mechanical Engineers, Storey's Gate, S.W.1, at 5.15 p.m. "Lubrication," by Dr. W. R. Ormandy.
- Mar. 25. SOCIETY OF CHEMICAL INDUSTRY, Glasgow Section.** Messrs. Ferguson & Forrester's Restaurant, 36, Buchanan Street, Glasgow. *Annual Business Meeting*, at 6.30 p.m. Also a joint smoker with the Glasgow and West of Scotland Section of the Institute of Chemistry, at 7.30 p.m., to which the Ardeer Chemical Club, the Andersonian Chemical Society, and the Glasgow University Alchemists' Club have been invited as guests.
- Mar. 25. SOCIETY OF CHEMICAL INDUSTRY AND INSTITUTE OF CHEMISTRY, Newcastle Sections.** Jointly with the Newcastle Chemical Industry Club. Annual Dinner, at Messrs. Tilley's Restaurant, Blakett Street, Newcastle, at 7.30 p.m. Amongst those who have promised to attend are Sir George and Lady Renwick, Prof. Arthur Smithells, Dr. J. T. Dunn, and the President of the Society of Chemical Industry, Mr. F. H. Carr, C.B.E.
- Mar. 29. HULL CHEMICAL AND ENGINEERING SOCIETY,** Hull Photographic Society's Rooms, Grey Street, Park Street, Hull, at 7.45 p.m. "Works filtration," by R. B. Foster.

THE INSTITUTION OF CHEMICAL ENGINEERS

The first of the biannual conferences for the 1927 session was held at Burlington House on March 9 and 10, and at the Hotel Victoria on March 11.

Two papers were presented at the afternoon session on March 9, when Sir Alexander Gibb, vice-president of the Institution, occupied the chair. In the first of these papers, entitled "Lead as a constructional material in chemical engineering," Mr. S. J. Tungay reviewed the peculiar properties of lead, which enable it to be modelled in the cold, its low melting point whereby it can be readily cast or pieces joined by soldering or burning, as well as the ability to obtain it in a remarkably pure condition at an exceptionally reasonable first cost, whilst a high price could be obtained for old metal or scrap lead. The purity of the lead and its bearing on its ability to resist corrosion was considered, and methods were given for testing the quality of chemical lead. The author also considered other influences which affect the corrosion of this metal, such as mechanical strain, the velocity of flow of the corrosive fluid and its concentration, and the effect of impurities. The application of this metal as a protective coating to vessels in which reactions were carried on under pressures or vacua next received the attention of the author, who advocated the homogeneous lining and described the Zeitler method. The concluding portion of the paper dealt with hard leads, and gave the ranges of antimony which could be employed in hard leads for various forms of chemical plant.

This paper was followed by a paper on "The production of dissolved acetylene and its application to lead burning," by Mr. W. C. Freeman. Attention was drawn to the dangers attendant upon the compression of acetylene gas, which is unstable and liable to be detonated by shock when subjected to pressures of 30 lb. per sq. in. The storage of this gas in cylinders under high pressures is effected first by thoroughly purifying the gas, which is then admitted to a cylinder which is filled to one-fifth of its volume with a porous material, lapok, which is chemically inert to acetone and acetylene and has a low conductivity which prevents rapid changes in temperature. Acetone is used in the cylinder as a solvent for the gas, the filling being carried out in three stages as follows. The gas is admitted until a pressure of about 75 lb. per sq. in. is attained, and then the cylinder is disconnected and laid aside to allow the temperature to return to normal; when this has been accomplished more gas is added until the pressure reaches about 150 lb. per sq. in., and again the cylinder is laid aside to cool. During the third stage the pressure is brought up to 225 lb. per sq. in. The paper concluded with an illustration of the types of burners in use and a demonstration of lead burning. The discussion which followed centred round the corrosion of lead, although questions were asked relating to the purity of acetylene and the temperature of the oxyacetylene flame.

At the evening meeting the President of the Institution, Sir Frederic L. Nathan, occupied the chair, and two papers, (a) "The function of the Schmiedel box in the manufacture of sulphuric acid," by Dr. H. J. Bush and Mr. A. Grounds, and (b) "Recent developments in the Mills

Packard chamber plant," by Mr. W. G. Mills, were read.

The authors of the first paper, in introducing their subject, pointed out that they were not dealing with the Schmiedel process, but simply with the function of the box and its ability to treat successfully gases containing varied and rapidly fluctuating percentages of sulphur dioxide from plants used in metallurgical operations such as the blowing of copper matte. After describing the box itself and the arrangements of the plant at the Mitterberg works at Ausserfelden, Mr. Bush and Mr. Grounds discussed the theory of the process, and gave the results obtained by Dr. Schmiedel. The authors also explained that although these boxes were originally fitted with regulus metal rollers, the later boxes were now fitted with cast iron rollers, which were found to resist corrosion very well. Diagrams were shown illustrating how the Schmiedel box could be incorporated into existing chamber plants and the various acid rings which might be formed, all taken from existing sulphuric acid plants. Such boxes have also been used in the metallurgical industry in the desulphurising of base metal sulphides, where the gases obtained are cold and wet.

As it was the desire of the meeting that this paper on the Schmiedel box and the paper on the Mills Packard chamber plants should be discussed together, Mr. Mills was next asked to read his paper. Opening with a description of the original type of tower having a wall slope of 8 : 1, the author dealt with the developments of the cooling water system—firstly, with the object of curtailing the amount of water used; secondly, with providing a means of distribution which could be easily cleaned when they became blocked by the rapid growth of algæ; and thirdly, a form of gutter which, whilst being easily cleaned, would not become readily choked up. The author then considered the latest type of chamber, in which the slope of the outer wall is 13.74 to 1, and showed how the walls of this chamber were supported so that the cooling water could have a clear passage from top to bottom over almost the entire surface of the chamber. Slides were shown of plants having peculiar features in their construction, such as wood and ferro-concrete framing for the chambers, the provision of a covered passage round the battery when erected in an exposed position, and the paper also included tables giving the sizes of the towers and their water consumption, as well as observations made from plants whilst in operation. Nor was the corrosive effect on the lead of the gas in the chamber omitted, specimens of the lead obtained from chambers which had been in use for 13 years being submitted for inspection. The discussion chiefly related, in regard to the first paper, to the nitric acid consumption, the corrosion of the rollers, and the possibility of using the Schmiedel box as an absorber; and in regard to the second paper, to cooling effects of the water both on the vapours inside the chamber and as a means of preserving the lead.

When the conference resumed on Wednesday afternoon, the President, Sir Frederic L. Nathan, again occupied the chair, and a paper on "Rubber as a constructional material in chemical engineering" was read by Mr. B. D. Porritt.

At the beginning of his paper Mr. Porritt considered the chemical and physical properties of caoutchouc, and remarked on the importance of the resins, proteins and sugars, both from the point of view of conferring stability to the action of oxygen on the caoutchouc and in the vulcanising processes. The processes of milling, compounding and vulcanisation, and the effect of each process upon the material were next described, mention being made of the ability to vulcanise *in situ* at the temperature of boiling water by the use of modern accelerators. Comparative figures were given showing how the elongation and the maximum stress per unit area of properly vulcanised rubber compared with the elongation and maximum stress per unit area of unworked raw rubber. The next point to receive attention was the use of fillers, and a distinction was drawn between materials which do not enhance the properties of the rubber and those which, acting as "reinforcing ingredients," do. The term "grain" and its significance to the engineer were also dealt with. In the latter portion of the paper the author enumerated the many uses to which rubber can be applied in a chemical works, and pointed out its inability to resist such substances as chlorine, bromine, ozone and nitric acid, and the fact that it is slowly carbonised by concentrated sulphuric acid. Several important points were brought out in the subsequent discussion. Briefly, these points were: the desire to be able to fix the rubber lining *in situ*, and not have to send large pieces of plant to rubber works to have this done; the need for a satisfactory method of fixing rubber to metal; that, if possible, it was desirable to be able to obtain rubber having standard characteristics. Questions were also asked relating to ball mill linings, stress diagrams, and the presence of vapour as a rubber preservative in tropical countries.

After dinner the Vice-President, Sir Alexander Gibb, took the chair, and Prof. F. C. Lea gave a lecture on "The effect of temperature on some of the properties of metals with particular reference to the limiting creep and stress."

In view of the modern trend of carrying out reactions at high temperatures and under high pressures, this paper was singularly appropriate and valuable. After briefly describing the various machines upon which the work had been carried out, and the methods adopted for heating the specimens and measuring the strains produced by the applied loads, the author proceeded to discuss the results obtained. The first set of results showed that with increase of temperature above a certain value there was a rapid diminution in the ultimate strength of the specimen, the elastic limit, too, diminished with increase of temperature, whilst, although the elongation first tended to diminish, afterwards it rose rapidly as the temperature increased. By plotting extension against time, Prof. Lea found that with loads below a certain value extension went on until fracture ensued. This stress, termed the "limiting creep stress," is dependent upon temperature, and the author next proceeded to show curves giving the relationship between the "limiting creep stress" and ordinary stress and temperature. Repetition stresses were also considered, and diagrams illustrative of how the breaking stress varied with the temperature were shown. Briefly the results

point to materials being able to withstand repetition stresses much better than continuous stresses at high temperatures. The materials considered in this paper were mild steels of carbon constants varying between 0.14 and 0.75, and duralumin. A number of questions were raised in the ensuing discussion relating to the effect of the previous working on the specimen, the behaviour of metal chrome steels, etc.

On Friday the fifth annual corporate meeting of the Institution was held at the Hotel Victoria, and after the general business had been transacted the President, Sir Frederic Nathan, delivered his presidential address, entitled "Some industrial developments and the chemical engineer."

Beginning with beet sugar, the President outlined the present position of the industry in this country, and indicated the lines along which future developments were possible, reference also being made to the work that is being done on the De Vecchis process. Turning to the rapid development of the motor car, Sir Frederic Nathan showed that the production of power alcohol was bound to become an important industry, and although its development in this country might be somewhat limited on account of the lack of raw materials, yet something might be done in the treatment of waste material such as the cossettes after the sugar had been extracted, and from other sources. Another industry in which he showed that considerable developments could take place was one drawing its raw material from the sea, namely, the manufacture of fish oil, glue, isinglass, fish meal, etc. Turning to coal, a survey was given of the field for development existing in this essential industry, and the importance of the production of hydrogen at low cost was emphasised. The Electricity Bill and its bearing on chemical industry were next considered, and it was pointed out that in the future chemical works using large amounts of steam in their processes could produce and might be made to produce electricity as a by-product by using high-pressure steam for its production and the low-pressure steam afterwards for their steaming processes, thereby utilising their coal more effectively. The address throughout contained valuable data on the various points raised. The thanks of the meeting to Sir Frederic Nathan were moved by Sir Alexander Gibb, President-elect, and seconded by Mr. Rogers.

In the afternoon the Institution again met, under the chairmanship of Sir Frederic Nathan, to hear a paper on "The Cross cracking process and plant," by Mr. F. M. Rogers. After considering the merits of cracking in the vapour and liquid states and the considerations which influenced the selection of the Cross cracking process, Mr. Rogers described the plant itself. In the description prominence was given to the formation of the joints on the headers of the heaters, the making and erection of the reaction chamber, a vessel about 42 ft. long, 3 ft. 10 in. external diameter, with walls 4 in. thick forged in one piece; the regulating valve, "fraid" valve and anchorage for the "fraid" pipe, as well as the cooling coils at the top of the dephlegmating column, upon which the product is so dependent. The foundations of these plants were considered, since this weight of plant formed a heavy compact load on a site whose weight-supporting value was not more than 2 cwt. per sq. ft. Another

point to which attention had to be given was in the staying of the dephlegmating columns, which have to be maintained vertical, and being about 7 ft. 4 in. in diameter and 52 ft. 6 in. in height, offer a considerable surface to the wind. The paper also included a section on operation and control, in which were given figures relating to throughput and yields, operating pressures and temperatures, whilst in the last paragraphs the author dealt with the operating costs and the product of cracking. The Chairman, in opening the discussion, referred to the fact that one-third of the gasoline used in the United States of America was produced by cracking. Points such as the length of time that petrol made by a cracking process could be kept, the design and methods of maintaining the dephlegmators vertical, etc. were amongst those discussed.

The annual dinner was held at the Hotel Victoria on March 11, Sir Frederic Nathan, K.B.E., presiding. The principal guest was the Rt. Hon. Sir Herbert Samuel, and among those present were Sir Frank Heath, Sir Arthur Duckham, Dr. W. H. Eccles, F.R.S. (President, Institution of Electrical Engineers), Mr. F. Palmer (President, Institution of Civil Engineers), Mr. W. Reavell (President, Institution of Mechanical Engineers), Mr. F. H. Carr, C.B.E. (President, Society of Chemical Industry), Mr. W. J. U. Woolcock, C.B.E., Sir Joseph Petavel (National Physical Laboratory), Sir Thomas Holland, Dr. C. H. Lander, and many members and visitors and ladies.

Proposing "The Institution of Chemical Engineers," Sir Herbert Samuel said that, although only four years old, the Institution showed all the signs of healthy and vigorous growth, the membership being nearly 400. Institutions such as these, which grew up almost naturally in the professions of this country, were a sign of the genius of this nation—for it was nothing else—for organisation. We had to depend upon our efficiency in the presence of world competition with other nations because Great Britain had no advantages upon which to rely except the abundance and excellent quality of its coal. We had to rely on our brains and the initiative of the great professions, such as that of the chemical engineer. He had been, so to speak, sentenced to six months' hard labour when he was appointed Chairman of the Coal Commission, and the members of that Commission, after an exhaustive and exhausting inquiry, came to the conclusion that the future of the coal industry depended very largely upon the adoption of a successful economic process for the distillation of coal. Processes were known for the distillation of coal, and the whole problem was one of devising a plant which would make a process commercially and practically profitable. Speaking of the relation of the State to science, Sir Herbert said it was essential that those responsible for the Government should attach full value to science. That was more essential to-day than it had ever been before. The establishment of the Department of Scientific and Industrial Research was a step of immense national importance. Great Britain had splendid traditions in science, particularly in the science of chemistry, and it was our task to carry on this great past to a still greater future. The prosperity of the nation depended upon the success of its great industries; which, in turn,

were dependent on the degree of our industrial chemistry. That, in its turn, relied upon the ability and energy of the three partners, the pure scientist, the commercial chemist, and the chemical engineer.

Sir Frederic Nathan, replying to the toast, said the present is a time of progress, and the Institution of Chemical Engineers could fairly claim to have advanced in all directions during the past year. The membership had increased by 78, the third volume of Proceedings, containing many valuable papers, had been issued, the library had been enlarged, the sphere and influence of the Appointments Bureau had been extended, and in instituting the examination scheme it would be admitted the Council had taken a step of great importance in enhancing the position of the members in the scientific, technical and commercial world. He personally had always placed the training of the chemical engineer in the forefront of the objects of the Institution, and ever since the Institution was founded the Council had been endeavouring to create, by arranging suitable training and facilities for the examinations, a high standard of knowledge and intelligence for the chemical engineer. The need of fully qualified chemical engineers had been manifested both in this country and abroad, as was shown by the Report of the Appointments Bureau. Unfortunately the Cambridge University authorities had not yet seen their way to introduce special courses for chemical engineers, but he felt confident it was only a matter of time before that and other universities and technical colleges would follow the example of the University of London and the Imperial College of Science, and establish Chairs of Chemical Engineering. The results of the examination held by the Institution were disappointing, except in so far as they disclosed the great need that exists for educational facilities. It was to be hoped, now that definite information of the requirements of the Institution were known, that the educational authorities would assist the rising generation to acquire the knowledge necessary to enable it to become members of a profession essential to the well-being of the country.

Sir Alexander Gibb proposed "Kindred Institutions," and welcomed the Presidents of the other Institutions who were present. He related something of the history of our leading engineering institutions, and showed how each was formed at the very moment it was required. At the present time there were, he said, 84 engineering and technical institutions in this country, and he expressed the hope that the near future would see a drawing together of these bodies, all of which have certain interests in common.

Dr. W. H. Eccles, replying to the toast, claimed that the great improvement in the conditions under which the working classes of this country to-day were living was due in the main to the work of the engineering and scientific institutions. Notwithstanding this, the engineering and scientific societies were not allowed to take any part in the conduct of the affairs of the nation, and they had extremely little influence upon the policy of the Government. They were, moreover, scarcely heard at all in the counsels of those who dictated the circumstances and the legislation affecting even their own professions. It was for this reason that he welcomed the suggestion made by Sir A. Gibb that

the kindred institutions should come together in order to bring some influence to bear upon the affairs of the nation. "Cohesion and adhesion" should be the motto of the engineering and scientific institutions of the country if they were to take their part in national affairs.

Mr. F. H. Carr, C.B.E., who also replied, said that the chemical engineer is as essential to chemical industry as air is to breathe. The whole progress of the application of chemical science to industry depended on what the engineer could achieve. If we looked back 20 years the progress in chemical industry was astounding, but that such progress had reached its consummation nobody for a moment could believe.

Sir A. Duckham, proposing "Our Guests," said he wanted to impress upon them very strongly that the chemical engineer was the man of the future. The chemical engineer was the administrator of our industry, and it was administrators that were wanted in this country at the present time. In this connexion there was great need for trying to get education in this country suitable for the chemical engineer. We wanted fundamentals; we wanted the fundamental engineer and the fundamental chemist. We did not want the high spots of the chemist or the engineer, but men with a fundamental knowledge of these great arts. Afterwards they could specialise in the line they wished, but we wanted first of all, in our education, fundamentals. Hitherto we had lacked fundamentals in this country. In his own industry he had great difficulty in finding men with that fundamental knowledge and with administrative ability to back it up. For this reason he would like to see a closer touch, during the training of the student, between the university and industry and commerce. It behoved all connected with big undertakings to open their doors to students in the long vacations and at other times so that the students might come into the works and see the processes being worked. This would help these young men to become good servants to the industry in the future. On the other hand, he would very much like to see our technical men going into the universities and lecturing from time to time and setting some examination papers, and so take the commercial side into the universities. He had spoken at a good many public schools and at conferences of headmasters, and there was undoubtedly a great desire on their part that the boys should see something of the lives they would have to lead in industry after they leave the college. He personally would like to welcome to the works of the country the professor and the teacher. It was very important that the teacher should be kept in touch with modern business and technical methods in order to see what industry wanted, and the training that was necessary for those coming from the colleges into industry. There was also another point he wished to put. Great developments were before us. He was an optimist, and was not one of those who was ready to decry this country and say it was going down. We were going ahead in spite of the fearful conditions we had been suffering from. It was in this spirit that he tried to encourage all his young people to get on with the job and get through with it and conquer. A motto which he always used was "Every-

thing is possible," even teaching turtles to fly. That would not be a bad motto for the chemical engineer. In one case, a very difficult problem, it seemed impracticable to get a certain plant in a certain position, but last night as he was walking down his drive an idea had come to him all of a sudden; he could not say how. It was found possible, and the moral was never to give up trying. With Mr. Carr, he maintained there was no limit to development in the future. In coupling the name of Sir Joseph Petavel with the toast, Sir Arthur said it had been his privilege to see the work that was being done at Teddington. It was amazing, and more use should be made of the National Physical Laboratory. He was certain that industry in this country would support research which could not be done under better conditions or with better brains than at the National Physical Laboratory.

Sir Joseph Petavel replied.

Mr. W. J. U. Woolcock, C.B.E., proposed the "President" and recalled the time when he worked with Sir Frederic Nathan during the war, when he was never let down in the answers that were provided for him to be given to the House of Commons. Sir Frederic had been equally thorough in the work he had been doing for the Institution, the success of which had been very largely due to his efforts.

Sir Frederic Nathan, replying, said he had accepted the office of President with considerable misgivings, but realising that with the great help of the Council and honorary officers some measure of success had been attained, he gave up the office without any misgivings. He wished his successor, Sir Alexander Gibb, as pleasant a time as he himself had had.

EMPIRE MINING AND METALLURGICAL CONGRESS

The Canadian Institute of Mining and Metallurgy announces that 500 acceptances have been received from intending delegates to the Empire Mining and Metallurgical Congress, which will be held in Canada during August to October, 1927. Over 200 acceptances have been received from Great Britain, and a further 600 persons have indicated their interest in the Congress.

The Congress will provide a unique opportunity not only of studying the mining opportunities but also the mining possibilities of Canada. Canada possesses one of the greatest fields left in the world to-day, but only a small proportion has been prospected; yet the results are so important that development should be greatly accelerated. Capital is wanted for development, preferably from within the Empire. Sir Alfred Mond said, on his recent visit to Canada, that countries were being forced into great economic units. One of these units would be the countries of Central Europe, another the United States; but he believed that within the constituent countries making up the British Empire there lay the possibilities of another economic unit so great in extent that it would dwarf by comparison all others. In such a scheme Canada would be a very important factor, and one of its greatest contributions would be the diversified products of its mines.

OBITUARY

PROFESSOR E. H. RENNIE

Time irresistibly takes its terrible toll and the names left upon the roll of our old guard are now very few. The Australian mail just in brings me a copy of the Adelaide *Register* of January 10, giving an account of the sudden death of my old friend, Edward H. Rennie, Professor of Chemistry in Adelaide University since 1885. He seemed to be in good health but on Saturday, January 8, going into the garden, after drinking some water, he lay down—and just died. A few days previously I had received a long chatty letter from him, dated December 20. In this he speaks of having had a very strenuous year and feeling somewhat played out. During the first six months he had been acting Vice-Chancellor of the University, then came the University Jubilee and after this the meeting at Perth of the Australian Association for the Advancement of Science, of which he was President. Added to this, he had been anxious on account of the illness of his wife and daughter. He tells me of the journey across the arid region to Perth, lasting three days. At one part, he says, the railway ran in an undeviating straight line, nearly 400 miles, across flat desert, where nothing was growing over about 2 feet high, the horizon being unbroken by a single tree or elevation of any kind. People seldom realise how much of Australia is country of this order. Aborigines were seen here and there, almost in their primitive condition, except that they wore clothes.

Rennie was born on August 19, 1852, at Balmain, Sydney. He graduated at Sydney University, B.A. in 1870, and M.A. in 1876. He was five years a master in Sydney Grammar School, and then a year and a-half at Brisbane Grammar School, after which he came to England and took the London D.Sc. in 1881. He assisted C. R. Alder Wright at St. Mary's Hospital. His first communication to the Chemical Society was made with Alder Wright (1880). He then spent some time with me at the London Institution; the only record of our work is in the *Chemical News*. I was greatly attracted to him, and was hoping to secure him as my chief assistant at the Finsbury Technical College, at the opening, in 1883; to my regret a tempting offer came from his home, and he returned to Australia in 1882. Two years later he was appointed Professor of Chemistry in Adelaide University. I visited him in 1914, reaching Adelaide a week ahead of the Association in order to stay quietly with him. I then gained some idea of the man's devotion to his post and the great burden of work upon his shoulders. Rennie's self-sacrificing service to his University, both as teacher and administrator, cannot be over-rated. He was extraordinarily thorough, deliberate and exact in his outlook and work, a most painstaking teacher and very popular, owing to his quiet, tactful manner. In his leisure he was an assiduous follower of the art of Izaak Walton; in fact, noted as a sea fisherman. His scientific services to Australia are also to be ranked very high, though unfortunately, owing to the official calls upon him, he had but little spare time for original inquiry. He devoted himself particularly to the study of native materials. Perhaps his most interesting discovery was that of trihydroxymethylnaphthaquinone in *Drosera Whittakeri*.

Australia is remarkable for its numerous species of long trailing *Droseras*. Rennie and I spent a delightful day in the hills behind Adelaide, and nothing interested me more in my journey around the Continent than his digging up the *Drosera* tubers and showing me the beautiful glistening crystals of the hydroxyquinone present in the outer layers. Why or wherefore such a compound should so come to the surface in a plant is difficult to say.

We spent another day on the sea shore, tracking down *Lotus australis*, which I was anxious to compare with our *corniculatus*. We found it in quantity, highly cyanophoric, very like the plant growing at Ballantrae. I fancy *corniculatus* must have wandered to the Antipodes and there changed its name.

Australians are in no way sufficiently alive to the need of studying their natural organic products. The wonderful work on eucalyptus oils done by Smith and Baker of Sydney has not yet been appreciated. Recently (February 12) an advertisement was printed in *Nature* for a lecturer and demonstrator in organic chemistry at the University of Sydney, salary £350 per annum. Only by accident is a chemist good enough for such a post likely to be bought at so low a price, perhaps that of a dock labourer—only a week's pay of the comedian, Billy Merson. No one in Australia will rate a man very high who is paid such a salary. It were time that organic chemistry were put upon a higher footing, especially in so important a seat of higher learning as Sydney—so that it may have some chance of being mentioned along with the harbour.

Australia can ill-afford to lose a man of Rennie's calibre, and will do well to take warning and, if she find other such men to serve her, relieve them more of ordinary routine labours. It is always to be remembered that the higher work done by a competent professor is that which most tells upon the character of the best students.

H. E. ARMSTRONG

DR. ADOLPH LIEBMANN

We greatly regret to announce the death of Dr. Adolph Liebmann, one of the original members of this Society.

Dr. Liebmann was born in 1852 at Bacharach, on the Rhine, studied chemistry under Kekulé and Clausius, and took the Ph.D. degree at Bonn in the late 'seventies. He then became assistant to Kekulé, and published from the University of Bonn several researches in organic chemistry. In 1881 he came to England and entered the dyestuff factory of I. Levinstein & Co., at Manchester, as research chemist, where he remained for 2 or 3 years. During this early period he obtained his first experience of chemical patent law, being closely connected with the historical patent actions of the Badische v. Levinstein. About the year 1884 he established a consulting practice in Manchester in partnership with his friend, the late Dr. A. Studer, and for a number of years the firm of Liebmann and Studer was well known in connexion with dyeing and textile chemistry, particularly as specialists in Aniline Black dyeing and cotton mercerisation. He also established a wide reputation as a chemical patent expert, in which field he became still more active when he removed to London in the year 1909.

He was retained for a number of years by the Badische Aniline Company and acted for them in many patent actions, notably the historical Rhodamine 6G case and the sulphuric anhydride litigation with Nobels. He was also called as expert witness in the protracted litigation regarding the saccharin patents, in the "oil-hardening" action of Crosfields *v.* Levers, the Osram lamp cases, and the Sulphur Black litigation. In most of these patent actions he was closely associated with the late Sir James Dewar, and frequently also with Lord Moulton prior to his becoming a Judge. In conjunction with Sir James Dewar he carried out in the laboratory of the Royal Institution many investigations upon patented processes.

His consulting work also extended to the United States, to which country he made many and lengthy visits. The last of these occasions was in connexion with the important "ore-floatation" litigation, in which after a very protracted fight judgment was given for his clients.

Dr. Liebmann combined with great theoretical and practical knowledge a keen logical mind which rendered him almost as good a lawyer as a chemist. He was regarded in the Courts as one of the fairest and most conscientious of witnesses, and his evidence always inspired great confidence with the Judges. His genial and kindly disposition endeared him to all who knew him.

After the outbreak of war he led a very retired life, as, although very loyal to his adopted country, he was of a highly sensitive nature. He was consulted by Lord Moulton in 1914 regarding the establishment of a national dyestuff industry, a proposal he greatly favoured, but the advice which he gave to keep politics out and leave the development of the scheme in the hands of chemists was unhappily not followed.

For some months his health had been gradually failing, and he passed away quite painlessly at his home at Weybridge on February 15 last.

PERSONAL AND OTHER ITEMS

Sir Alfred Mond, Sir Harry McGowan, Mr. J. G. Nicholson, Lieut.-Col. G. P. Pollitt and Mr. T. W. Stuart have been appointed to the board of the United Alkali Co., Ltd.

The University of Manchester will confer the honorary degree of D.Sc. on Prof. R. Willstätter, lately professor of chemistry in Munich University, and on Dr. C. S. Myers, C.B.E., F.R.S., Director of the National Institute of Industrial Psychology, on Founder's Day, May 18.

At the June Convocation of Durham University it is proposed to confer the honorary degree of M.Sc. upon Mr. Hugh Dunford Smith, who is the Hon. Secretary of the Newcastle-upon-Tyne Section of the Society of Chemical Industry.

Mr. P. W. Clutterbuck, O.B.E., M.Sc., Ph.D., has been appointed assistant lecturer in physiological chemistry in the University of Manchester.

The late Dr. J. J. Acworth, founder of the Imperial Dry Plate Co., and formerly chemist to Ilford, Ltd., left £562,026, with net personalty £528,177.

The late Sir Edward Thomas Holden, J.B., head of E. T. Holden & Sons, Ltd., tanners and leather manufacturers, left £124,967, with net personalty £119,861.

Prof. D. Berthelot, a member of the Académie des Sciences, and the second son of the eminent chemist, Marcellin Berthelot, has died at the age of 62.

Dinner to Sir D. Milne Watson

A complimentary dinner was given on March 8 at the Savoy Hotel by the governing bodies of the several national organisations of the gas industry to Sir David Milne Watson, the governor of the Gas Light and Coke Company, and president of the National Gas Council of Great Britain and Ireland. Among those present were Prof. A. Smithells (in the chair), Mr. P. Ashley, Alderman Sir A. Ball, Mr. C. Bigham, Prof. J. W. Cobb, Mr. J. E. Cowen, Sir A. Duckham, Mr. J. H. Ellis, Sir Fortescue Flannery, Mr. R. W. Foot, Mr. W. L. Galbraith, Mr. F. W. Goodenough, Mr. T. Goulden, Brig.-Gen. H. B. Hartley, Mr. T. Hardie, Councillor W. J. Harvey, Mr. R. M. Holland-Martin, Mr. F. H. Jones, Alderman Sir W. Kay, Alderman J. H. Lloyd, Mr. J. W. Napier, Bailie J. B. Paterson, Mr. J. F. Ronca, Alderman J. H. Waddington, Mr. W. E. Whyte, Mr. J. Wilkinson, Mr. H. Woodall, Lieut.-Col. H. W. Woodall, and Mr. H. James Yates.

The Gas Industry in 1925

The Board of Trade has issued Part II of the return relating to all authorized gas undertakings in Great Britain for 1925 (price 10s. 6d.). The return deals with 782 undertakings with a total nominal capital of £171,987,989, an increase of £3,582,215 over the amount shown in the previous return. The receipts on revenue account, £66,042,643, show a decline of £667,347 from the previous year's total, but the expenditure, £56,908,648, shows a decrease of £978,979, and the gross profit has been increased by £311,632.

Colloid Chemistry of the Rubber Industry

The first course of the series of Gow Lectures on the Colloid Chemistry of the Rubber Industry will be given under the auspices of the University of London by Dr. E. A. Hauser, of Frankfurt-on-Main, at University College, London (Gower Street, W.C.1), during the first fortnight in May next. Full particulars of these lectures will be published later.

United Kingdom Iron and Steel Output

In February the output of pig iron in the United Kingdom amounted to 567,900 tons, as against 434,600 tons in January, 539,100 tons in April, 1926 (the month immediately preceding the strike), and 502,000 tons in February, 1926. The production includes 194,600 tons of hematite, 187,700 tons of basic, 142,900 tons of foundry, and 17,500 tons of forge pig iron. The number of furnaces in blast at the end of February was 162, an increase of 10 since the beginning of the month. At the end of April, 1926, 147 furnaces were in blast, and at the end of February, 1926, 146. The output of steel ingots and castings amounted to 819,100 tons, or an annual rate of 10,648,300 tons, allowing for the shorter month, compared with 730,700 tons in January, 661,000 tons in April, 1926, and 703,800 tons in February of that year. In the years 1913 and 1920 respectively the monthly

average production was of pig iron 855,000 tons and 669,500 tons, and of steel ingots and castings 638,600 tons and 755,600 tons.

Survey of the Sugar and Glucose and Spirit Distilling Trades in 1924

The following data are extracted from the "Preliminary Reports No. 3" of the Third Census of Production (1924) regarding the sugar and glucose trade:—During 1924 the total quantity of sugar refined was 19,785,000 cwt., valued at £44,454,000, as compared with 11,300,000 cwt. (£8,995,000) refined in 1907. Other products, including glucose, molasses and caramel, raised the total value of the products in 1924 to £53,174,000, as compared with £12,315,000. The substantial increase in the rate of Excise duty must be taken into account in comparing these values. Exports of refined sugar amounted to 1,447,000 cwt.; imports for home consumption amounted to 11,337,000 cwt. The molasses exported totalled only 591,000 cwt., as against the total import of 3,258,000 cwt. Of the refined sugar exported, nearly the whole, 1,008,000 cwt., was consigned to the Irish Free State, together with 21,000 cwt. of molasses and 34,000 cwt. of glucose. A further quantity of 2,558,000 cwt. of unrefined sugar was also imported either for use by manufacturers or for direct consumption. The net output of the industry, calculated as explained above, was £19,923,000, which represents a net output per person employed of £1578, compared with £506 in 1907. During 1924 the number of persons employed in the industry was 12,626, compared with 6501 in 1907, the greatest number employed at any time being 12,215. Thus the output of refined sugar in 1924 was 75% above that of 1907, though the increase of persons employed in the industry was 94% and the increase in horse-power of engines was 160%. The total capacity of the engines at the works of the firms engaged in the industry in 1924 was returned as 35,371 h.p., compared with 13,618 h.p. for the year 1907. The capacity of electric generators in the trade was 18,004 kw., against 4205 kw.

In 1924 about one-third less spirits were distilled in England and Wales than in 1907, while those distilled in Scotland had increased by about 12%. This leaves the 1924 return slightly below that of 1907 in quantity. In 1924 the plain spirits amounted to 34,191,000 gallons, compared with 36,057,000 gallons in 1907, the corresponding figures for methylated spirits being 1,733,000 gallons and 1,098,000 gallons respectively. The total value of the product, however, exclusive of duty, amounted to £7,125,000 in 1924, as against £3,417,000 in 1907. Imports of spirits in 1924 amounted to 3,306,000 gallons, and exports totalled 8,373,000 gallons, including 172,000 gallons exported to the Irish Free State. During the year 24,000 cwt. of yeast were exported, against 193,000 cwt. of yeast imported. The net output of the distilleries was £2,575,000, and the net output per person employed was £557, against £236 in 1907. The total horse-power employed was 12,685, compared with 10,529, and the electrical generating capacity was 5041 kw., against 503 kw.

The returns from factories engaged in compounding, rectifying and methylating spirits showed a total product for this trade valued at £6,597,000, as compared with £4,027,000 in 1907. Only 952 persons were employed,

but the net output amounted to £1,000,000, and the net output per person employed totalled £932, against £354 in 1907. The production included 5,468,000 proof gallons of methylated spirit (£499,000) against 5,675,000 gallons (£270,000) in 1907; and 2,118,000 gallons of British and Irish spirits (£5,987,000), against 5,903,000 gallons (£3,685,000). These figures do not include spirit methylated by firms for their own use in the manufacture of varnish, etc. The horse-power employed was 360 (412).

Synthetic Oils in Germany

The Leunawerke, near Halle, which form part of the I.G., is to begin, states the *Manchester Guardian*, the production of "synthetic oils" from lignite in April. At first the output will be small, but will be increased in response to the demand of the market.

Non-metallic Mineral Products in Canada in 1925

According to a statement issued by the Dominion Bureau of Statistics at Ottawa, production from the 35 plants in Canada classified under the Miscellaneous Non-Metallic Mineral Products Industry amounted in value to \$7,978,183 as compared with an output value of \$6,991,904 in 1924. This industry includes 13 establishments manufacturing artificial abrasives or abrasive products, 2 plants making graphite electrodes, 6 concerns producing gypsum products, 11 mica-trimming shops, and 1 plant making foundry supplies.

Production of artificial abrasives such as crude carborundum, aloxite, firesand and fused alumina during 1925 was valued at \$5,186,802, and the output of abrasive products, and other commodities, including ferrosilicon, was sold for \$722,516, making a total production value for the industry of \$5,909,318, as compared with a corresponding figure of \$5,628,653 in 1924. Capital employed in the industry amounted to \$6,160,392, employees numbered 598 persons, payments in salaries and wages totalled \$853,458, and raw materials cost \$2,006,618. Four plants in Ontario and one in Quebec made artificial abrasives, while eight establishments in Ontario manufactured grinding-wheels, sand-paper and similar products.

Gypsum products made in this industry amounted in value to \$1,001,509. Eight plants were in operation, capital employed totalled \$640,486, employees numbered 213, and materials cost \$348,046. Wall-coating gypsum board and gypsum blocks were made in three different plants in this industry and the output was valued at \$864,483; in addition, hardwall plaster and some wall-board was made in plants which also quarry the gypsum and are therefore included in the mineral production group. Plaster castings and ornamental plaster works made up the bulk of the remainder of the output in this industry.

Errata

We regret that in the notice of the "Annual Reports, 1926," which appeared in our last issue, the section on "Drying oils, varnishes and driers" was wrongly attributed to Mr. A. A. Drummond. This section was contributed by Mr. S. S. Woolf, Mr. Drummond being the author of the section on "Resins and solvents."

In the issue of March 4, p. 182, col. ii, the word "rhodium" on line 15 should read "sodium."

PARLIAMENTARY NEWS

British Industries Fair

In reply to Colonel Day and Mr. Lunn, Sir Burton Chadwick said that 74,162 buyers, of whom 1581 came from overseas, visited the London section of the Fair. This latter figure did not include a considerable number of United Kingdom agents of overseas firms who were buying on foreign account. The figures showed an increase of 25% on those for last year. In addition, the general public visited the Fair to the number of about 25,000 in London and 10,000 in Birmingham. The exhibitors in all sections of the Fair have expressed themselves as more than satisfied with the actual and anticipated results, although no official figures are available as to the business done. — Mar. 7

Disinfectants (Tests)

Answering Lieut.-Col. Fremantle, Mr. Guinness said he was not aware that the test for disinfectants which the Ministry of Agriculture had adopted for use under the Diseases of Animals Acts was in any sense unreliable. It was adopted after full consideration and scientific advice as being a test conducted under conditions which resembled as closely as possible the actual conditions under which the disinfectants prescribed by the Ministry were used in practice. The test had been prescribed on the advice of the Government chemist. Mar. 7.

Imports of Oil and Motor Spirit

Sir P. Cunliffe-Lister informed Mr. G. Hall that the imports of crude petroleum in the years 1910, 1925 and 1926 respectively were 187,318 gallons, 569,082 169 gallons, and 538,239,606 gallons. Total imports of refined petroleum for the same years respectively were as follows: 345,282,518 gallons, 1,044,219,196 gallons, and 1,374,696,350 gallons — Mar. 8

Safeguarding of Industries Act (Chemical Products)

Replying to Major Crawford, Sir P. Cunliffe-Lister said that before an article could be exempted from duty under Section 10 (5) of the Finance Act, 1926, the Board must be satisfied not only that the article was not being made in His Majesty's Dominions, but also that there was no reasonable probability that it would be so made within a reasonable period. With regard to the lactic acid B.P. mentioned, applicants were given the name of a manufacturer who proposed to produce it in the near future and was setting up the necessary plant for the purpose. Mar. 8.

Sir Burton Chadwick informed Mr. Fenby that an Order under Section 10 (5) of the Finance Act, 1926, exempting phenacetin, phenazone, oxalic acid, hydroquinone and certain other products from duty was made by the Treasury on March 7. — Mar. 9.

Sale of Food and Drugs Bill

This Bill was read for the third time and passed. — Mar. 11

COMPANY NEWS

BRUNNER, MOND & CO., LTD.

A dividend has been declared on the ordinary shares for the three months ended December 31, 1926, at the rate of 17½% per annum, making 7½%, less tax, for the

nine months, equivalent to 10% for the year. The sum of £10,964 has been carried forward. This dividend constitutes the final payment to shareholders under the old company, which was recently merged into the Imperial Chemical Industries.

UNITED ALKALI CO., LTD.

The net profit for 1926 amounted to £195,765 (against £391,085 for 1925), plus £103,709 brought forward. A dividend has been recommended on the ordinary shares at 10% per annum (same), leaving £11,708 to be carried forward. The report states that the company suffered severely by the general strike and the coal stoppage, resulting in loss of employment and revenue to its works in this country, a much greater proportion than usual of the profits being provided from its works abroad, the dividend from the North American Company being £149,132. Referring to the formation of Imperial Chemical Industries, Ltd., the report states that all the shareholders, except about 4%, agreed to exchange their shares for those of the combine. This is considered highly satisfactory. Five new directors have been appointed—Sir Alfred Mond, Sir Harry McGowan, Mr. J. G. Nicholson, Lieut.-Col. G. P. Pollitt, and Mr. T. W. Stuart. The first four have long been directors of other of the Imperial Chemical Industries constituent companies, and their election will promote a consolidation of policy and interest. Mr. Stuart was a prominent member of the staff during the whole life of the company until recently, when he retired.

HADFIELDS, LTD.

A dividend has been announced for 1926 on the ordinary shares at the rate of 2½%, less tax, compared with 3% for 1925.

COURTAULDS, LTD.

The fourteenth ordinary general meeting of the ordinary shareholders was held on March 8, Mr. Samuel Courtauld (chairman) presiding. The year 1926 had been a very difficult one for the company, various events, of which the coal strike was by far the most damaging, combining to reverse a promising start and bring about a serious falling off in the year's business. The weaving department showed considerable strength under the trial. Sales fell away in the autumn, but not so seriously as might have been expected, due to a bold policy of manufacturing for stock. But towards the end of the year stock grew too heavy, and although sales were beginning to improve, the output was still being restricted. The consumption of artificial silk in England and the greater part of Europe had also been adversely affected by a change in fashion, which, at the moment, did not favour highly lustrous materials. Under these handicaps, and in spite of some restrictions of production, it was not surprising that the company had accumulated large stocks of yarn. Since the end of the year the volume of business had been steadily growing, and this fact, coupled with some evidence of more stability in the world-price of artificial silk, enabled the directors to think they were past the worst. The Wolverhampton factory was practically completed during the summer, but the state of business did not warrant

starting more of the plant than was necessary for the building up of the organisation. Here there was a very large power of production which could be brought in at any moment. The factory at Cornwall, Ontario, had been running at full capacity since the summer, and was selling its output. Both the factory belonging to Glanzstoff-Courtaulds at Cologne and the one at Calais were well advanced, and would be in a position to start before many months. Referring to the agreement made with the Snia Viscosa Company with the object of promoting technical and commercial collaboration (cf. CHEM. AND IND., Feb. 4, 1927, p. 110), the chairman said this agreement represented the furthest steps—apart from the company's American interests—which it had yet taken in the way of international commitments and alliances, and if markets to-day were feeling more confidence in the stability of artificial silk prices, he thought it might be partly due to the knowledge of the arrangement. The year 1926 was also a disappointing one for the industry in America, but the American Viscose Corporation reported that sales were now improving and stocks falling. As regards the immediate outlook, there were two reasons why an improvement should be shown. One was the general feeling that prices were not going to be lower at present. Buyers did not want lower prices to-day; what was wanted was stability. The other reason was that the disturbances caused by the reductions in prices made last year, varying from 15% to 25%, were beginning to subside, and the new price-level was opening a wider field to the use of artificial silk, and the expected stimulus to consumption was at last beginning to be felt. The price of first-grade viscose silk to-day was only about 15% to 20% of that of natural silk; it was 25% cheaper than worsted yarn of similar counts, and only about 33% higher than mercerised cotton. It was interesting to note that whilst the prices of these other yarns stood at anything from 30% to 90% above pre-war level, viscose silk was actually offered to-day at a lower price than in 1914. Whilst the chairman did not expect further substantial economies to be effected in working costs, he believed that new methods would be concerned chiefly with improvements in quality. Substantial progress had already been made in this direction. In reply to a shareholder, the chairman said the company was not linked up with the Nuera Company in any way. The only connexion it had with it was in investigating a new process under an option in which the Nuera Company had a minor share. The company was continually following up fresh discoveries, inventions and developments, and it was much too soon to say whether this particular piece of experimental work would be a success or not. A final dividend was declared on the ordinary shares of 3s. 3d. per share, free of income tax, making 4s. 6d. or 22½% for the year. [For the accounts, see CHEMISTRY AND INDUSTRY, Feb. 25, 1927, p. 175.]

HENRY BESSEMER AND CO., LTD.

A net loss is shown for 1926 of £27,667, making with the debit balance brought in, £64,286. This is arrived at after making provision for depreciation at the usual rate, and after writing off losses incurred in realisation of the remainder of the surplus stocks purchased prior to 1925. A profit of £1,307 was made in 1925.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali.—£6 15s. per ton, f.o.r. Special terms for contracts.
Bisulphite of Lime.—£7 10s. per ton, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
Copper Sulphate.—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate.—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Sulphammoniac.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included. Sod. Chlorate.—2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton. contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
Arsenic, Sulphide, Yellow.—2s. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 2d. per lb.
Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 5s. per ton. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£7—£10 per ton, according to grade and locality.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—1s. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 4s. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P.
 Wood Tar.—£4—£5 10s. per ton and upwards, according to grade.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carboic.—Crystals, 6d. per lb. Crude 60's, 1s. 8d.—1s. 9½d. per gal.
 Acid Cresylic, 99/100.—2s. 3d.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 1d. per gal. Pale, 95%, 1s. 10d.—2s. per gal. Dark, 1s. 9d.—1s. 10d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 2½d.—1s. 3½d. per gal., ex works in tank wagons; Standard motor, 1s. 9d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s. 2d.—2s. 5d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 11½d. to 2s. 3d. per gal. Firm. Pure, 2s. 3d.—2s. 5½d. per gal.
 *Xylol.—2s. 3d.—3s. per gal. Pure, 4s. per gal.
 Creosote.—Cresylic 20/24%—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9½d.—1s. 0½d. per gal., according to quality. Solvent 90/160, 1s. 8d.—2s. 1d. per gal. Solvent 95/160, 1s. 9d.—1s. 10d. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
 Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—87s. 6d.—105s. per ton, f.o.b. according to district. 79s.—79s. 6d. per ton March/April shipment.
 Pyridine.—90/140.—9s. 6d.—13s. per gal. Nominal. 90/180.—7s. 6d. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis. d/d.
 Acid Sulphanilic.—9d. per lb. 100% basis d/d.

Aniline Oil.—7d. per lb., naked at works.
 Aniline Salts.—7d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d. per lb.
 m-Cresol 98/100%.—2s. 8½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—8d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 5d.—2s. 6d. per lb. Brisk.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots—1s. per oz.
 Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 4d.—1s. 4½d. per lb. Less 5%. Very firm.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4d.—1s. 6d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 1½d. per lb. Less 5%. Very firm market.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—11s. 3d.—11s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—8s. 9d. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.
 Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 4d.—2s. 6d. per lb. Potassium.—1s. 11d.—2s. 1d. per lb. Sodium.—2s. 2d.—2d. 4d. per lb. All spot.

Calcium Lactate.—1s. 4d.—1s. 5d. per lb.

Chloral Hydrate.—3s. 2d.—3s. 5d. per lb., duty paid.

Chloroform.—2s. 3d.—2s. 7d. per lb., according to quantity.

Cresote Carbonate.—6s. per lb.

Ether meth.—1s. 1d.—1s. 11d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—6s. 6d.—7s. per lb.

Hexamine.—2s. 4d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.).—1s. 5d. per gal. f.o.r. makers' works, naked.

Hydroquinone.—4s. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perochloride.—22s. per cwt., 112 lb. lots.

Magnesium Carbonate.—Light Commercial £33 per ton net.

Magnesium Oxide.—Light Commercial £37 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%, in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 10s. 6d.—12s. per lb., according to quantity; Liquid (95%), 12s. per lb. Detached cryst., 14s. 6d. per lb.

Mercurials.—Red oxide, 6s. 11d.—7s. 1d. per lb., Levig, 6s. 7d. per lb.; Corrosive sublimate, Lump, 5s. 2d.—5s. 4d. per lb., Powder, 4s. 9d. per lb.; White precip., Lump, 5s. 2d.—5s. 6d. per lb., Powder, 5s. 7d. per lb., extra fine, 5s. 7d.—5s. 8d. per lb.; Calomel, 5s. 9d.—5s. 11d. per lb.; Yellow Oxide, 6s. 4d.—6s. 5d. per lb.; Persulph B.P.C., 5s. 7d.—5s. 8d. per lb.; Sulph. nig., 5s. 4d.—5s. 5d. per lb.

Methyl Salicylate.—1s. 8d. per lb.

Methyl Sulphonol.—15s.—15s. 3d. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—3s. 9d.—4s. per lb.

Phenazone.—5s. 9d.—6s. per lb.

Phenolphthalein.—6s.—6s. 3d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 94s. per cwt., less 2½% for ton lots. Very firm market.

Potass. Citrate.—1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins.

Rosocin.—4s. per lb. spot.

Saccharin.—55s. per lb.

Salol.—3s.—3s. 3d. per lb.

Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—77s. 6d.—82s. 6d. per cwt. net, according to quantity.

Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal 1s. 10d.—1s. 11d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.

Sulphonol.—10s.—10s. 3d. per lb.

Tartar Emetic B.P. cryst. or powder.—2s.—2s. 1d. per lb.

Thymol, Puriss.—11s. 6d.—12s. per lb., according to quantity. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.

Aubepine (ex Anethole).—10s. 3d. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb. Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.

Cinnamic Aldehyde.—Natural, 17s. 6d. per lb.

Coumarin.—10s. 9d. per lb.

Citronellol.—14s. 6d. per lb.

Citral.—9s. 6d. per lb.

Ethyl Cinnamate.—10s. per lb.

Ethyl Phthalate.—3s. per lb.

Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—19s. per lb. Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Shui Oil) 12s. per lb.—(ex Bois de Rose) 16s. per lb. Linalyl Acetate.—(ex Shui Oil) 14s. 6d. per lb.—(ex Bois de Rose) 18s. per lb.

Methyl Anthranilate.—9s. per lb.

Methyl Benzoate.—4s. 6d. per lb.

Musk Ketone.—36s. per lb.

Musk Xylol.—8s. 6d. per lb.

Nerolin.—3s. 9d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—11s. per lb.

Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 6d. per lb. Vanillin.—18s. 6d. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 3d. per lb. Bergamot.—30s. per lb. Bourbon Geranium.—11s. 3d. per lb.

Camphor.—63s. 6d. per cwt. Cananga, Java, 22s. 6d. per lb. Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure.—6s. per lb.

Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 20s. 9d. per lb. Lemon.—10s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb. Otto of Rose.—Bulgarian, 70s. per oz., Anatolian, 30s. per oz. Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 20s. per lb. Japanese, 8s. 6d. per lb. Firm. Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The Complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than May 7th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Mar. 24th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Alexander and Baer. Fine-grinding mills. 5703. Mar. 1.

Anode Rubber Co., Ltd. (Klein and Szegvari). Apparatus for producing liquid dispersions. 5769. Mar. 1. Process of producing aqueous dispersions of organic substances. 6092. Mar. 4.

Anode Rubber Co., Ltd. (Klein, Szegvari, Gotlieb, and Wilson). Apparatus for preventing separation of constituents of liquid dispersed systems. 6037. Mar. 3.

Bourdais. Dispersion of solids or liquids. 5678. Mar. 1.

- Crowe. Ball mills. 5767-8. Mar. 1.
 Fusion Corp., and Hollins. Extraction of dust etc. from gases. 6237. Mar. 5.
 Industrial Associates, Inc. Spray drying. 6126. Mar. 4. (U.S., 18.6.26.)
 Jackson (American Encaustic Tiling Co.). Tunnel kilns. 5617. Feb. 28.
 Jackson (Bennett, Inc.). Production of dispersions. 5596. Feb. 28.
 Johnson (I.-G. Farbenind.). Apparatus for carrying out chemical etc. processes. 5967-8. Mar. 3.
 Meyerhofer. Effecting conversions of solids etc. 5865. Mar. 2. (Ger., 13.4.26.)
 Moseley. Emulsions and dispersions. 6206. Mar. 5.
 Smith. Mixing-machines. 5716. Mar. 1.

I. - Complete Specifications

- 23,722 (1925). Wade (Philips' Glöcilampenfabr.). Continuously separating a gaseous mixture. (266,396.)
 30,645 (1925). Evans. Drying-cylinders. (266,481.)
 31,399 (1925). Radiation, Ltd., Brayshaw, and Brayshaw. Furnaces. (266,487.)
 7418 (1926). L'Air Liquide. Separating constituents of gaseous mixtures. (263,732.)
 21,269 (1926). Powley & Sons, Ltd., and Powley. ing apparatus. (266,615.)
 28,755 (1926). Hoffmann. See II.

II. Applications

- Chem. Fabr. in Billwader, and Kuhlwein. Obtaining high-grade products from raw coal etc. 6209. Mar. 5.
 Cuvier. Fuel-economising product. 5615. Feb. 28.
 Gardner. Manufacture of carbon. 6238. Mar. 5.
 Goskar. Distillation of carbonaceous materials. 5751. Mar. 1.
 Inray (Allgem. Ges. f. Chem. Ind.). Treatment of hydrocarbons. 5857. Mar. 2.
 Johnson (I.-G. Farbenind.). Working with hydrocarbons at high temperatures. 5966. Mar. 3.
 La Ribosière. Treating mineral oil hydrocarbon material. 5870. Mar. 2.
 Pope. Apparatus for low-temperature carbonisation. 6005. Mar. 3.
 Semet Solvay Co. By-product coke ovens. 5567. Feb. 28. (U.S., 22.3.26.)
 Soc. Internat. des Proc. Poudhomme-Houdry. Apparatus for desulphurisation of gases. 6086. Mar. 4. (Fr., 4.3.26.)

II. - Complete Specifications

- 9860 (1926). Schicht A.-G. Manufacture of highly viscous lubricating-oils. (250,947.)
 11,074 (1926). I.-G. Farbenind. Manufacture of motor fuel. (251,969.)
 15,040 (1926). Still. Distillation of solid fuel in coke ovens. (266,584.)
 15,396 (1926). Humphreys & Glasgow, Ltd. (Brady). Purification of gas. (266,586.)
 28,755 (1926). Hoffmann. Apparatus for distilling or drying coal etc. (261,740.)
 2313 (1927). Chavanne. Gasification of solid fuels. (266,656.)
 *30,124-5 (1926). Chem. Werke Carbon Ges. Highly-active carbon. (266,673-4.)
 *32,715 (1926). Humphreys & Glasgow, Ltd. Apparatus for carburetting water-gas. (266,680.)

*32,716 (1926). Humphreys & Glasgow, Ltd. Apparatus for making gas. (266,681.)

*5165 (1927). Wiberg. Reducing to carbon monoxide the carbonic acid content in gases. (266,729.)

IV.—Applications

- British Dyestuffs Corp., Gibson, and Payman. Producing wax-like polychloronaphthalenes. 6159. Mar. 4.
 Carpmael (Bayer & Co.). Azo dyestuffs. 5889. Mar. 2.
 Comp. Nat. de Mat. Col. et Manuf. de Prod. Chim. du Nord. Manufacture of dyestuffs etc. 5749. Mar. 1. (Fr., 5.3.26.)

IV. - Complete Specifications

- 25,713 (1925). Cassella & Co., Ransford, and Carpmael. Vat dyestuffs. (266,404.)
 2286 (1926). I.-G. Farbenind. Manufacture of alanes of the anthraquinone series. (246,840.)
 4850 (1926). Chemical Works (Sandoz), and Böniger. Manufacture of diazotisable azo-dyestuffs. (266,533.)
 5594 (1926). Carpmael (Chem. Fabr. vorm. Schering). Manufacture of halogen substituted oxindol-3-acetic acids and homologues thereof. (266,539.)
 10,158 (1926). Brit. Dyestuffs Corp., Saunders, and Goodwin. Azo dyes. (266,561.)

V.—Applications

- Hagiwara. Manufacture of artificial silk etc. 5700. Mar. 1.
 Jackson (Bennett, Inc.). Production of waterproof paper etc. 5618. Feb. 28.
 Micklethwaite. Production of artificial silk yarns. 6182. Mar. 5.

V. - Complete Specifications

- 29,539 (1925). Bruckhoff. Degreasing raw wool etc. (266,436.)
 29,549 (1925). Boger. Softening, spinning, and twisting artificial silk. (266,438.)

VI. Application

- Gorrie. Machine for dyeing etc. 5806. Mar. 2.

VI -- Complete Specification

- 28,427 (1926). Clavel. Weighting silk. (266,640.)

VII. - Applications

- Bachmann. Production of active silicic acid. 5571. Feb. 28. (Austria, 18.3.26.)
 I.-G. Farbenind., and Staib. Converting oxides into anhydrous fused chlorides. 6220. Mar. 5.
 Kasser, Lederer, and Stanczak. Precipitating metal hydroxides. 5610. Feb. 28. (Czecho-Slovakia, 9.3.26.)
 Nishigawa. Manufacture of ammonium sulphate. 5747. Mar. 1.
 Pease. Manufacture of potassium phosphate etc. 5552. Feb. 28.

VII.—Complete Specifications

- 21,315 (1925). Kleinmann, and Buttnerwerke A.-G. Treatment of natural aluminium hydroxides. (266,225.)
 23,727 (1925). Skoglund. Manufacturing sulphuric acid. (266,397.)
 29,548 (1925). Wohlers. Apparatus for making anhydrous metallic chlorides. (266,437.)
 18,879 (1926). Colum. Production of double salts of calcium halides with calcium lactate. (266,607.)
 *1601 (1927). Soc. Chim. Usines du Rhône. Treating acetic acid. (266,684.)
 *3009 (1927). Norsk Hydro-Elektrisk Kvaestofakt. Purification of gases for production of ammonia. (266,689.)
 *5251 (1927). I.-G. Farbenind. Treatment of crude nitrate of soda (caliche). (266,735.)
 *5378 (1927). I.-G. Farbenind. Treatment of crude nitrate of soda. (266,744.)

VIII.—Applications

Dartmoor China Clay Co., Ltd., and Parker. Bleaching clay etc. 5607. Feb. 28.

Hartford-Empire Co. Refractory body. 5566. Feb. 28. (U.S., 1,3,26.) Glass furnaces. 5588. Feb. 28. (U.S., 24,6,26.)

Jackson (American Encaustic Tiling Co.). Manufacture of ceramic ware. 5595. Feb. 28. 5617. See I.

VIII.—Complete Specifications

32,808 (1925). Kreidl. Production of white opacifying-media for glasses and enamels. (245,757.)

3157 (1926). Case. Porous compounds from gypsum. 266,524.)

21,335 (1926). Loessin. Manufacturing ceramic materials etc. (259,236.)

*5566 (1927). Hartford-Empire Co. Refractory body. (266,751.)

X Applications

Dawson. Alloy. 5960. Mar. 3.

Dicker (Wiarda & Co.). Treatment of manganese ores. 5745. Mar. 1.

Garnud and Sollis. Aluminium alloy. 6010. Mar. 3.

Lacell. Production of magnesium. 6027. Mar. 3. (Fr., 63,3,26.)

Mond (Metallbank und Metallurgische Ges.). Apparatus for entering ores etc. 5560. Feb. 28.

Rogers (Remy-Stahlwerke, Stahlschmidt & Co. Ges.). Treating refined steel. 5583. Feb. 28.

X Complete Specifications

21,509 (1925). Croese. Manufacture of metals and alloys in the electric furnace. (266,658.)

29,026 (1925). Fiodin and Gustafsson. Producing iron and other metal and alloys. (243,353.)

19,647 (1926). Goldschmidt A.-G. Utilising scrap metal. (257,905.)

3707 (1927). Goldschmidt A.-G. Bearing metal alloy. (266,696.)

5035 (1927). Selz. Aluminium alloys. (266,720.)

XI Application

Dupire. Electrolytic apparatus. 6107. Mar. 4. (Fr., 63,3,26.)

XI Complete Specifications

21,509 (1925). Croese. See X.

33,011 (1925). Fullers United Electric Works, Ltd., and White. Electric accumulators. (266,497.)

11,554 (1926). Gill. Electric batteries. (266,565.)

XII Complete Specification

29,526 (1925). Nestfield and Goodricke. Manufacture of soap. (266,435.)

XIII Application

Schmidding. Preparation of lacquers from tung oil. 5629. Feb. 28.

XIII.—Complete Specifications

21,195 (1925). Pollak. Manufacture of condensation products of urea or its derivatives and formaldehyde. (248,904.)

10,533 (1925). Frenkel and Brust. Manufacture of priming material. (266,401.)

11,055 (1926). Bakelite Ges. Purification of condensation products produced from phenols and aldehydes. (247,956.)

5586 (1927). I.-G. Farbenind. Manufacture of condensation products of urea and formaldehyde. (266,752.)

XIV.—Application

Medgyes. Preparation for dusting rubber. 6093. Mar. 4. (Hungary, 25,9,26.)

XIV.—Complete Specifications

27,092 (1925). Schidrowitz, and Vultex, Ltd. Manufacture of rubber. (266,418.)

29,433 (1925). Barrett Co. Rubber-compounding material. (243,384.)

*5178 (1927). Soc. Itall. Pirelli. Vulcanisation of rubber. (266,732.)

XV.—Application

Reekin. Leather preservative. 6228. Mar. 5.

XV.—Complete Specifications

22,532 (1926). Kemmler. Manufacture of chamois and like leather. (266,622.)

*3802 (1927). I.-G. Farbenind. Manufacture of tanning agents. (266,697.)

XVI.—Application

Jackson. Production of fertilisers. 5793. Mar. 2.

XVI.—Complete Specification

*3702 (1927). Chem. Fabr. vorm. Schering. Diminishing loss of carbohydrates in plants when stored. (266,695.)

XIX.—Applications

Bolton, Read, and Pulvo, Ltd. Preservation of eggs. 6246. Mar. 5.

Schwartauer Honigwerke und Zuckerraffinerie. Production of pectin solutions. 5711. Mar. 1. (Ger., 1,2,27.)

XX.—Applications

Carmphael (Bayer & Co.). Manufacture of pharmaceutical products. 5750. Mar. 1. Manufacture of aminoquinolines. 6167. Mar. 4.

Ellis (Chem. Works formerly Sandoz). Preparation of soluble derivatives of meta-aminobenzoic acid esters. 6160. Mar. 4.

I.-G. Farbenind. Production of condensation products of urea etc. 5586. Feb. 28. (Ger., 27,2,26.) Production of side-chain bearing aromatic compounds etc. 5965. Mar. 3. (Ger., 3,3,26.)

Riedel A.-G. Manufacture of hydro-aromatic dicarboxylic acids. 5555. Feb. 28. (Ger., 22,6,26.)

XX.—Complete Specifications

16,919 (1925). Dehn (Chem.-Pharm. A.-G. Bad Homburg). Manufacture of quinine solutions. (266,209.)

21,195 (1925). Pollak. See XIII.

26,083 (1925). Johnson (Badische Anilin & Soda Fabrik). Manufacture of organic compounds containing oxygen. (266,405.)

26,593 (1925). Johnson (Badische Anilin & Soda Fabrik). Manufacture of methanol and other oxygenated organic compounds. (266,410.)

26,786—7 (1925). Fernbach, Yull, and Rowntree & Co., Ltd. Production of citric acid. (266,414—5.)

2286 (1926). I.-G. Farbenind. See IV.

*5155 (1927). Chem. Fabr. vorm. Schering. Manufacture of compounds suitable for combating vagotomy. (266,727.)

*5586 (1927). I.-G. Farbenind. See XIII.

XXI.—Complete Specification

30,116 (1925). Lage. Production of photographic plates, films, etc. for indirect three-colour photography. (266,468.)

XXII.—Application

Mexco, Ltd., and Scott. Explosives. 6032. Mar. 3.

XXII.—Complete Specification

24,308 (1926). Jamotte. Antiseptic and disinfectant. (259,233.)

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*British India*: Soap (233). *Canada*: Microscopes (B.X. 3299); Steel, rubber (C.X. 2226). *Chile*:

Refined camphor (261); Asbestos, emery, chemical products, hydrochloric and sulphuric acids, alcohol, ferrocyanide of potassium, disinfectant, disinfecting apparatus, lubricating and illuminating oils, paint, varnish, iron and steel, metal, glass, galvanised and black tubes, copper tubing (C.X. 2206). *Denmark*: Small refrigerators, air compressors (240). *Germany*: Refrigerating machinery (242). *Holland*: Leather (243). *Poland*: Chemicals, raw and dressed hides (246). *Rumania*: Porcelain insulators (B.X. 3314), Zinc plates, tin, lead (A.X. 4383). *Spain*: Skins (249). *Sweden*: Resin (251). *Switzerland*: Skins (252). *Uruguay*: Fuel oil (B.X. 3319). *Yugoslavia*: Photographic dry plates, printing paper (245).

Safeguarding of Industries Act

The Board of Trade give notice that representations have been made to them under Section 10 (5) of the Finance Act, 1926, regarding ammonium perchlorate and potassium guaiaccol sulphamate.

Section 10 (5) of the Finance Act, 1926, is as follows:—
“The Treasury may by order exempt from the duty imposed by section one of the Safeguarding of Industries Act, 1921, as amended by this Act, for such period as may be specified in the order, any article in respect of which the Board of Trade are satisfied on a representation made by a consumer of that article that the article is not made in any part of His Majesty's Dominions in quantities which are substantial having regard to the consumption of that article for the time being in the United Kingdom, and that there is no reasonable probability that the article will within a reasonable period be made in His Majesty's Dominions in such substantial quantities.”

Any person desiring to communicate with the Board of Trade with respect to the above-mentioned applications should do so by letter addressed to the Principal Assistant Secretary, Industries and Manufactures Department, Board of Trade, Great George Street, S.W.1, within two months from the date of this notice.

The Board of Trade also give notice that the Treasury, by Order dated March 7, 1927, have exempted, under the foregoing provision of the Finance Act, 1926, for a period of twelve months from the date of the Order, the following articles from the duty imposed by Section 1 of the Safeguarding of Industries Act, 1921, as amended by the Finance Act, 1926:—

R acetone; acetone (fermentation); acetone, synthetic; acid oxalic; amidopyrin (pyramidon, dimethyl-amido-antipyrine); barbitone (veronal, malonal, malourea, acid diethyl barbituric, diethyl malonylurea, hypnogen, deba); furfural; guaiaccol carbonate (duotal); methyl sulphonal (diethyl sulphonemethylethylmethane, trional); phenacetin (acetparaphenetidine); phenazone (antipyrine, phenyldimethylpyrazolone, analgesin, anodyne, dimethyl oxychinizin); piperazine (diethylene-diamine, dispermin); pyramidon veronal; salol (phenyl salicylate); sulphonal.

News from Advertisements

A chemist is required to organise and control a Food Research Department of an old-established firm.

Three positions, as chief chemist, works manager, and

production manager, respectively, are available with a large English viscose silk works.

Certain copies of this JOURNAL and also of the “Annual Reports” are wanted.

No. 12

EDITORIAL

Scientific and Industrial Research

THE Report of the Committee for Scientific and Industrial Research for the year 1925-6 has just been issued, and it is, as usual, full of interesting information and sage reflections. All those who claim to be interested in chemistry or the chemical industry in general should read this document: in the brief space available for editorial comment on it only two or three points can be mentioned. Many others deserve attention, and we trust that they will remain in our mind. In considering pure scientific research the committee finds no sign of decay in this country; in every branch of natural science we can point to men of international reputation occupying positions which allow them full scope for their talents. Nor does there appear to be any chance that a young man of talent, however lowly his origin or restricted his means, will fail to find the opening in the world of pure science that his talents deserve. The committee has done much to assist students, and has, during the last seven years, granted allowances to about 700 students, of whom nearly 400 were students of chemistry. This appears to us to be a fair measure of the extent to which chemistry is now recognised as essential to our industrial efficiency and progress. The committee, however, reports that some modification may become necessary: it appears that at present far too many men are encouraged to specialise in chemistry, very large numbers of applications are received whenever a post for chemical research is advertised: on the other hand, the demand for men who combine a study of chemistry with a study of other subjects, such as agriculture, biochemistry or botany, outstrips the supply. The committee has done a little to differentiate between the various branches of scientific research, and in this report the following significant sentence occurs:—"But in any future scheme, however administered, we feel sure that more differentiation ought to be made in the interests not only of pure science and of industry, but of the men themselves."

In considering the state of industrial research the report states: "Everyone who is anxious to promote industrial research in this country is confronted by the fundamental difficulty that public opinion is not yet fully aroused to its necessity. To justify this statement--if it requires justification--one need only compare the quality of the articles in the daily newspapers which deal with financial, literary and administrative questions with those which deal with scientific matters." These observations are true and melancholy; the fault may be shared in due proportions by the newspaper editors, the general public, and, so far as chemistry is concerned, by the whole body politic of chemists. It would not be difficult, so far as chemistry is concerned, to remedy this state of things. Certainly the chemistry of most of our daily newspapers is far below the proper standard.

The Bureau of Abstracts

A few years ago there came into being a committee to supervise the preparation in this country of abstracts of the new work in pure and applied chemistry. In such a journal as this we need not dilate on the usefulness of abstracts. Wisdom that is hid and treasure that is hoarded up, what profit is in them both? As we, to our great joy, have no part in the preparation of the abstracts we are free from any bias or prejudice concerning them. We consider, on the other hand, that we are quite competent to express our opinion of them and, in our view, having regard to the nature of abstracts and the purpose thereof, the abstracts prepared by the Bureau deserve the very highest praise. Very few new facts or new guesses at facts escape the close net spread for their capture; few purely ephemeral notes find their way into the two familiar records of chemical activity. The names of those who organise this huge task and of those who participate in the work are well known to us all; perhaps some of our readers do not realise how great a debt of gratitude they owe to the chairman of the Bureau, Prof. J. C. Philip. He has worked hard at

he has often been delayed and sometimes disappointed, but never dismayed or disheartened. He has been not only patient and long-sighted, but he has a natural gift of quiet determination which has been of great value to him and to his colleagues. The rapid progress in the preparation of the British abstracts has been partly due to his tact and good judgment, but still more to the fixity of his mind, which has overcome many obstacles, and has never been turned aside from that course which he found to be the best and most sensible. Such a man is usually a very good chairman: rumour has it that Prof. Philip has been an excellent chairman of the Bureau. We do not know that rumour is to be greatly relied upon: in this case the uncertain opinion of rumour is confirmed by the unanimous judgment of British chemists that the abstracts issued by the Bureau, which he founded and has hitherto guided, are such that we should be very proud of them.

Electrical Power from Tropical Seas

It would be a doubtful compliment to Georges Claude to style him the Jules Verne of chemical engineering, for he has proved too conclusively and too frequently that he is no mere dreamer, but a seriously practical engineer. We confess that, remembering our own experiences with a catalytic gas process conducted at a mere 60-lb. pressure, we smiled rather quizzically and prematurely when we first read we think in an early post war issue of *Comptes Rendus* of Claude's proposal to work a synthetic ammonia process at a thousand atmospheres pressure. Before many moons, however, we had cause metaphorically to kick ourselves, for a small scale unit was soon operating successfully, to be followed with astonishing rapidity by full-size synthetic ammonia plants. We now learn from a survey of the world's fixed nitrogen position made by the Fixed Nitrogen Laboratory of the United States that thirteen Claude plants were operating in 1925, producing *in toto* 54,250 tons of fixed nitrogen. Four plants are in France, two in Italy, two in Spain, and one in Belgium, Poland, America, Japan and Czechoslovakia. Several of these plants are being enlarged, that at Bethune probably now having an annual capacity of nearly 20,000 tons of ammonia. It is, therefore, with profound interest that we read of the latest proposal of Georges Claude to win power from tropical seas. Between the surface water and the deep sea water of tropical oceans there exists a considerable difference in temperature. The cold currents from the polar seas maintain the deeps at a low temperature, whilst the surface water is continually heated by the sun. It is theoretically possible, as even our limited acquaintance with thermodynamics tells us, to utilise this temperature difference for the generation, or rather transformation, of energy. We shall not attempt to discourse learnedly on Carnot heat diagrams, sources of heat and "sinks," but shall content ourselves with describing an experiment carried out by MM. Claude and Boucherot before the French Académie. If warm water at a temperature of 30° C. is caused to boil under vacuum, steam at low pressure is obtained. If this steam is drawn off by the vacuum obtained by con-

densation through the agency of cold water, a turbine may be supplied with driving force and electricity generated. The French savants estimated that 400,000 kw. of electrical energy could be generated by the employment of 1000 cubic metres of tropical sea water per second. It requires but a simple calculation to show us that the theoretical production of power in these circumstances must be very low in efficiency, and we shall await with interest the practical details of the process. The heat difference is there spread over unlimited amounts of water so that low theoretical efficiencies may not matter from the economic point of view. The fundamental idea in one form or another is not new, but several attempts to apply it practically have met with failure. The reputation which Georges Claude has already won makes us hesitate to be sceptical, and it may not be long before we have to repent and blot out a present recollection that many treasure hunts in tropical seas have ended in disaster.

The Beethoven Centenary

Beethoven died on March 26, 1827. The shadow of his genius is cast, irrespective of time and space, over all nations and professions, and our homage to his great talent is as sincere as that of our music masters, even though, as chemists, we cannot so thoroughly comprehend its sway. Our highbrow musical friends may smile a little, and think that our professed love for Enterpe is really nothing more than a mild flirtation, but we shall continue to believe, perhaps egotistically, that we can appreciate Beethoven. Man cannot live by bread alone, and the chemist must realise that to live within the narrow confines of his own profession is unprofitable, unsoeable and, in the end, uninspiring. Beethoven may have been a musical genius and naught else. Our Irvines, Armstrongs, Perkins and Popes may be great chemists and naught else, although we number amongst our friends many great chemists who are no mean musicians and artists, but if the average chemist is to take his true place in the world he must do the things and love the things which his fellow voyagers on the ship of life consider essential to culture. "The man that hath no music in himself is fit for treason, stratagems and spoils." The works of Beethoven, of Shakespeare, are an international heritage, and so no less are the discoveries of the world's great chemists. The inspiration which the memory of Beethoven engenders may well help to heal the sores of war amongst chemists. Britain may be justly proud of her chemists and Germany of hers, but it is the common duty of the sons of all nations to build up and embellish the science of chemistry. We cannot afford to live in a splendid isolation in the world of to-day. The most recent instance of this truism within our own sphere is given in a paper by Perkin and Robinson in the *Journal of the Chemical Society*. The synthesis of harmaline presents a very notable stage—we imagine the authors will not make it a climax—in the work on the harmala alkaloids which has been proceeding over the past twenty years, but Perkin and Robinson do not refrain from paying a gracious compliment to the work of Otto Fischer. Beethoven died on March 26, 1827. Centenaries have, indeed, more than a sentimental value.

rate has been only 5, a reduction of 96%. This remarkable reduction could hardly be accounted for in any other way than by the purification of its water supply.

A properly chlorinated water, then, is a sterile water. Yet only about 0.2 part per million is required to accomplish it, which is equivalent in cost to only 1 cent per person per year.

To-day it is common practice to chlorinate sewage effluents that are discharged into rivers and lakes. This is done to some extent at both Montreal and Toronto, and Cleveland, for instance, has two enormous chlorinating plants treating the sewage of the city prior to its discharge into Lake Erie to protect the bathers at the city beaches. At Detroit the waters of the bathing beaches have been chlorinated by means of a motor-boat carrying and distributing liquid chlorine from cylinders. At the present time over 1000 swimming pools in North America are sterilised with liquid chlorine.

It has been made compulsory that certain trade wastes be chlorinated before discharging into trunk sewer lines. This applies particularly to abattoirs and

CHLORINE TREATMENT OF CONDENSING WATER

The maintenance of a high vacuum in a modern power house is of great importance because a variation of one inch affects steam consumption and, therefore, the fuel bill, to the extent of about 6%. A good vacuum can be maintained only if the water-side cooling surfaces of the condenser tubes are kept perfectly clean. When the cooling water is drawn from the river, lake or sea it is frequently found that a glutinous, clinging mud adheres so firmly that it can only be removed by mechanical means—steam and compressed air being of no use. This trouble is often due to some micro-organisms of the alga or amoeba type. It has been found that one part or less of liquid chlorine per million parts of water will maintain a perfectly clean condenser at a saving of about 50% of the labour alone for cleaning by mechanical means.

In the case of sea water, mussels and limpets grow luxuriously in these places due to comfortable temperatures and because a beneficent engineer is constantly pumping food to them. This food consists of micro-organisms in the water, but if these are killed with chlorine at the inlet, the mussels will starve to death and the tube will be kept smooth and clean.

METALLURGY

In metallurgy, it is used in the chlorination of ores, more especially for the separation of gold and silver from other base metals, for the separation of cobalt from nickel, and for the recovery of tin from scrap by the detinning process. The last process is becoming rapidly of greater importance due to the increased production of tin plate containers and the high cost of tin. Dry chlorine will combine with tin to form anhydrous tin tetrachloride, whilst the iron on which the tin is plated will remain unaffected. There are various patented processes for carrying out this reaction, and it is quite economical, as it turns an apparently waste material into a valuable compound which finds a ready market in the silk industry.

FLOUR MILLS

Flour, in the freshly-milled condition, is slightly yellow in colour and contains gluten which is not sufficiently pliable and elastic to give it the best baking qualities. When this flour is stored, the intensity of acidity is increased which results in the gluten becoming elastic. As this intensity of acidity increases the flour becomes correspondingly whiter through elements in the atmosphere decolorizing the yellow colouring matter known as carotin.

The storing or ageing of flour is not economically feasible. It means large buildings and close control to ensure that the ageing does not progress too far.

All the large flour mills and many of the small ones now mature their flour by exposing it to chlorine or some compound of chlorine in specially-designed apparatus. The function of the chlorine is to accelerate Nature's process, and accomplishes its results by both increasing the pH value and oxidising the carotin. This system requires little attention, and only ordinary labour is required.

Formula: 17 lbs caustic soda (76%) 12 lbs liquid chlorine, 10 galls. water.

Manufacture of liquid bleach "sodium hypochlorite" on a small scale using liquid chlorine and caustic soda

tanneries, for which as high as 250 parts per million, for example, are sometimes required to destroy anthrax.

A few years ago the daily papers were full of the "oyster typhoid epidemic," which the U.S. Public Health Service attributed to eating oysters from an area which was polluted with sewage. So to-day we have "chlorinated oysters," and certain States have devised regulations to make this compulsory.

Many creameries and other bottling works use chlorine for sterilising bottles, and statistics show that it is far more efficient than steam in removing the last traces of bacterial infection from the bottles. In bottle sterilisation the chlorine is applied in the final rinse water.

Chlorine gas is a splendid deodoriser in that it combines with most noxious gases to produce sweet, or at least pleasant-smelling compounds. Thus, the organic sulphur compounds which are responsible for the odours around kraft pulp mills, and odours emanating from municipal incinerator plants etc. may be effectively disposed of by simply allowing a small amount of chlorine to pass up the stack with the gases or products of combustion.

PETROLEUM INDUSTRY

In the petroleum industry gasoline and kerosene, as obtained from the stills, contain small amounts of constituents which impart an objectionable odour and so must be removed before the product can be sold. These impurities have been identified principally as mercaptans. For many years a caustic-soda solution of bicharge has been used to accomplish this removal, but in recent years chlorine in the form of calcium or sodium hypochlorite has been introduced for the same purpose. In this case the mercaptans are oxidised to sulphides ($R-SH$ to $R-S$).

Aluminum chloride, made usually by the action of chlorine on bauxite, is used in one process for cracking oils.

Ethylene glycol, which is being introduced as an anti-freeze for automobile cooling systems, is made from ethylene C_2H_4 , one of the hydrocarbons found in refinery gas. The ethylene is first converted to ethylene dichloride, which is proving to be one of our most useful solvents, in some ways superior to both chloroform and carbon tetrachloride. When ethylene dichloride is hydrolysed we obtain ethylene glycol.

the presence of water. Temperature also plays an important part. The metallic chlorides serve important functions in industry and are indispensable as catalysts in some important organic syntheses.

Organic Chlorides. In organic chemistry chlorine may be used in elemental form to produce: (1) Addition products; (2) Substitution products; (3) Oxidation products; and (4) It may be used in combination with other elements to produce anhydrides and effect condensations. For these we find a large number of chlorine compounds in use, such as $AlCl_3$, $SbCl_5$ and $SnCl_2$.

A typical series of additional compounds is the acetylene derivatives. The products obtained by substitution are probably of greater importance and interest than those falling under other headings. Among important examples, we may cite monochlorobenzene, used as a dye intermediate; *p*-dichlorobenzene, used to combat peach tree borer; monochloroacetic acid, benzyl and benzal chlorides and their oxidation products, benzaldehyde and benzoic acid.

Organic chlorination is carried out at widely different temperatures, and the catalysts differ essentially in

The Canadian Salt Company's absorption system

Chloro derivatives are also now produced by direct chlorination. We thus have methyl and methylene chlorides, chloroform and carbon tetrachloride, and recently some derivatives of ethane have appeared on the market.

SYNTHETIC HYDROCHLORIC ACID

Synthetic hydrochloric acid may be manufactured by burning hydrogen in an atmosphere of chlorine, and at our Sandwich Plant we have installed a plant capable of producing 15 tons of 22° Baumé acid per day. This plant burners and absorption system, is made entirely of fused silica. Inasmuch as the chlorine and by-product hydrogen used are pure, the resulting acid is water white and of C.P. grade. The chief outlets for this acid are for metal cleaning in the steel mills, leather and textile industries, manufacture of sugar from starch, inorganic preparations, etc.

OTHER USES

Metallic Chlorides.—It need only be said that all the common metals or their ores react directly with chlorine under favourable conditions to yield chlorides. Some metals, such as tin and aluminium for example, must be dry whereas others, such as iron and zinc, require

nature. Plant construction suitable for one is fatal to another, and the presence or absence of light also plays an important part.

Many very useful compounds are made in this way.

CHLORINE IN NATIONAL DEFENCE

Major-General Fries, of the United States Army, recently stated that there is no chemical which is more indispensable to the Chemical Warfare Service than liquid chlorine, and his statement is more or less borne out by the fact that the United States Government, at the close of the world war, had increased their chlorine plant at Edgewood Arsenal, Maryland, from 50 to 100 tons daily capacity. Even this was not sufficient to meet the demands of the service, and civilian plants were called upon to make up the deficiency.

Chlorine, however, as an individual gas, was effective only in the early days of the war. We all recall the awful casualties inflicted upon the Canadian troops in the initial gas attack north of Ypres in April, 1915. Chlorine alone was used in this instance, but it was soon found that gas masks, using activated carbon, furnished almost complete protection from chlorine when chlorine was used alone.

This led to the use of other gases, each having a specific purpose, and at the close of the war we had some 44 different chemicals, 31 of which had chlorine as a base, or as an essential constituent.

Among the more important gases used were :-

Chloropierin (trichloronitromethane)	vomiting gas.
Blue Cross (diphenylchlorarsine)	sneezing gas.
Phosgene (carbonyl chloride)	lethal gas.
Mustard gas (ethylchlorosulphide)	blistering gas.
Lewisite (an arsenic-chlorine compound)	penetrating gas.
Chloroacetophenon	tear gas.

In addition to these various gases, we also have

of war gases containing chlorine remained practically free from the ravages of the epidemic. This, coupled with the fact that in 1918 approximately 40% of the two and a half million men in the U.S. Army entered hospital with influenza, resulted in numerous tests being made, particularly by the Army Medical Corps, which showed that chlorine in concentrations of 0.015 mg. per litre (1 part in 133,000) had a distinctive curative value in common colds, influenza, whooping cough, and other diseases in which the infecting organisms were located on the surface of the mucous membranes of the respiratory passages.

Over 8000 patients have been treated by the medical officers of the U.S. Army. Accurate records have been

Section of standard Class V. tank car for liquid chlorine

chemicals for producing the smoke screen, namely, the tetrachlorides of tin, silicon, titanium and carbon.

One method for making picric acid during the late war was to first produce chlorobenzene, nitrate it, then replace the chlorine by hydroxyl, by treatment with alkali.

We hear a great deal about chemical warfare being inhuman, but the actual statistics do not bear this out. It is a question whether it is not just as sportsmanlike to fight with chemicals as it is to fight with machine guns. In any event chemical warfare is here to stay, and the various nations will continue and are continuing, development along this line.

THE USE OF CHLORINE IN PREVENTIVE MEDICINE

It was observed during the "flu" epidemic in 1918 that employees of plants engaged in the manufacture

kept of 1312 cases, 51.8% were reported cured, 38.3% improved, and 9.9% reported not improved.

These startling results caused many clinics to spring up in the larger cities where a number of patients could be treated at one time in chambers or rooms specially constructed for the purpose. The patient is supposed to remain in this chamber for about one hour, during which time the correct concentration of chlorine and air are maintained by means of a fan and special chlorine control apparatus. A physician is in charge, and the patient may read, rest, or converse while undergoing treatment.

Many excellent physicians have used chlorine without much success, while others are most enthusiastic over results obtained. Much depends upon how it is handled, and there is considerable evidence that the treatment has been abused in the hands of inexperienced laymen.

Medical Life, of New York City, announced, through its editor, that replies received, in answer to a questionnaire on the value of chlorine as a cure for colds and other respiratory ailments, have established

Dome and fittings for Class V tank cars

the value of the treatment beyond all question. This questionnaire was sent to practically all of the leading nose and throat specialists in the U.S. using chlorine.

From the standpoint of preventive medicine, then, it is believed chlorine has a great field of usefulness.

If time permitted, one could mention many other commercial uses for liquid chlorine: for example, chlorine is now being used in Japan in the refining of sugar; it is used for bleaching shellac; for the manufacture of pure cellulose for artificial silk; and in the De Vans process for the manufacture of pulp from esparto grass and straw. Chlorinated fish oil has also appeared as a substitute for linseed oil in some applications.

From the foregoing it is evident that chlorine is essential to present conditions of life. It is fortunately widely distributed in combined form, and by reason of electrical developments, readily produced in elemental condition. We have seen how it is employed to maintain health and to prevent the spread of sickness. We are further enabled by way of chlorine to proceed to the manufacture of paper, artificial silk and of dyes, and so produce those products which lend to our pleasure and comfort in life. It is also possible to produce through chlorine other products leading to agony and death. Chlorine, like everything else, is capable of "Use and Abuse." Abuse must be controlled: use must be extended.

INDUSTRIAL NOTES FROM CANADA

The International Nickel Co. of Canada, Ltd., has now completed a \$750,000 addition to its refinery at Port Colborne, Ontario. The purpose of the addition is to produce electrolytic nickel of high quality, 99.9% pure. It is expected that about 6000 tons of the company's annual production will be of this grade.

THE CONTACT PROCESS FOR SULPHURIC ACID*

By W. H. DE BLOIS†

By the contact process we understand that process for the manufacture of sulphuric acid by which sulphur dioxide gas produced by the burning of sulphur, sulphur bearing ores, or as a by-product in the treatment of sulphide ores, is made to combine with the oxygen of the air to form sulphur trioxide, which then only requires the addition of water to form sulphuric acid. The contact process is one of the outstanding achievements in chemical engineering. From the standpoint of the difficulties involved and the time absorbed in their solution, it probably stands alone in the field of technical chemistry. In fact, the manufacture of sulphuric acid from the earliest days has been surrounded with problems which have interested the ablest chemists.

THE CHAMBER SYSTEM

Although this paper has particularly to deal with the contact process, it may not be amiss to refer briefly to the chamber system, which was, and still is, a most important factor in the industry.

The development of the lead chambers began in England towards the end of the eighteenth century in response to the increased demand for sulphuric acid which followed then, as it does now, the general industrial progress of the country. England was in the first stages of that remarkable commercial evolution which was destined to make such progress in the following century. Sulphuric acid had hitherto been made in small quantities and in an intermittent fashion by burning a mixture of sulphur and nitrate of soda in the horizontal neck of a glass retort set in a sand bath, with a little water in the bottom. One can easily imagine the difficulties these early pioneers experienced as the sulphur was ignited and a small proportion of the sulphur dioxide combined with oxygen under the influence of the nitrogen acids, finally condensing on the sides of the glass vessel, which probably cracked as the reaction continued, the day's labour being lost. One can also understand the price that was asked and evidently obtained for the product, some \$1000 per ton, a figure which would make the modern sales executive turn green with envy and long for the good old days.

Probably the breakage of the vessels first led to the construction of a small lead chamber, and soon afterwards to a continuous system of operating whereby the sulphur dioxide gas was fed continually into the chambers with the necessary amount of nitrogen oxides and water in the form of steam or spray. Towers for recovering the oxides of nitrogen at the end of the chambers soon followed, and it may not be amiss to mention that these oxides in effect perform the same function as platinum or other catalyst in the contact process, for in both the sulphur dioxide is encouraged to combine with oxygen from the air to form the trioxide, a reaction which otherwise would not proceed at all or at an extremely slow rate. The nitrogen oxides are nearly all recovered

* Read before a joint meeting of the Montreal Section of the Society of Chemical Industry and the Canadian Institute of Mining and Metallurgy at Montreal, January 17, 1927.

† The Mond Nickel Co., Ltd., Coniston, Ont.

and used over again in the chamber process, while the platinum in the contact process apparently remains unaltered over many years, if conditions are properly maintained.

The chamber process would, in all probability, have remained unchallenged had it not been for one principal objection, viz., the fact that the maximum strength of the acid produced does not exceed 80%, and any further concentration must be at the expense of fuel in some form and at considerably increased cost. In the early days this was not a serious objection, but as the demand grew from industries such as oil refining, explosives and others, for a stronger acid, the problem became more acute. Even then matters might have remained as they were had it not been for an entirely new demand for fuming sulphuric acid—or, as it is known in the trade, oleum. This is a solution of SO_3 in 100% H_2SO_4 , and could not be made by any modification of the chamber process. Fuming acid had been made for many years, and the limited demand supplied by a single firm in Bohemia, which decomposed by heat a ferric sulphate leached out from pyritic slates, the resulting sulphur trioxide being led into and absorbed in sulphuric acid until the desired strength was obtained. The product was, naturally, very impure, and probably almost black in colour. This, then, was the state of affairs in the fourth quarter of the last century, the period which marks the early development of the contact process, and leads up to its introduction on a large scale in the opening years of the present century.

THE CONTACT REACTION

Although the so-called contact reaction was observed by Davy and others, the first record of its possible use for the manufacture of sulphuric acid is in a patent taken out by one Peregrine Phillips, a vinegar manufacturer of Bristol, in 1831. Whether Phillips used his spare time while waiting for the fermenting process to proceed, or whether the then mysterious agency which caused the formation of vinegar started a train of thought which led to experiments with platinum as a contact substance, is not stated, but the fact remains that he describes with almost prophetic insight the fundamental features of the contact process. He proposed to draw sulphurous acid gas and air in proper proportions through porcelain tubes heated to a strong yellow heat and containing platina in a finely divided state. He affirms that sulphuric acid gas will be instantly formed, and proposes to absorb this gas in water in a tower packed with pebbles. Having taken out this patent, Phillips disappears from the scene, and no other record appears of his activities or of whether he actually tried out his patent on a commercial scale. It is interesting to speculate as to the type of man this Peregrine Phillips was, and we are at liberty to give full scope to our imagination, for we are not burdened by a biography or particulars of any kind beyond the fact that he was a manufacturer of vinegar and took out a patent covering the manufacture of sulphuric acid by the contact process. That he was an Englishman may at once be admitted, and, therefore, furnishes another argument for those who claim that more scientific discoveries originate in England than is usually

realised. It is further probable that he was not a University man, for technical courses in those days were practically non-existent, and the ordinary college course would hardly incline a man to take up the work of vinegar manufacture. Is it not more likely that he was a practical man with a natural scientific bent, who used his spare time in experimenting along various lines, and who, if the truth were known, had probably worked out some kinks in the fermentation of vinegar which would have surprised his contemporaries? We now know that some of his statements were erroneous—that strong yellow heat is too high for proper working of the reaction, and that, further, it is impossible to absorb sulphur trioxide completely in water. To this practical man, however, belongs the credit of making the original scientific discovery, and of realising its possible commercial importance.

From the time of Phillips's patent up until about 1875 little progress can be recorded. Several sporadic attempts were made to replace the chamber process, but with little success. The importance of eliminating impurities from the gas had not been realised, the laws of gas reactions were but imperfectly understood, and last but not least, the real incentive was lacking—namely the existence of an urgent demand for fuming acid. This last reason was removed by the synthetic production of alizarine about 1870, followed by other colouring matters, all of which required oleum or fuming acid for their preparation. The natural result followed. The Bohemian manufacturer, using the distillation method mentioned, advanced the price until it became almost prohibitive. Here was the real incentive, and it is not surprising that almost immediately several chemists and manufacturers started to experiment with the object of developing the contact process on a commercial scale.

Just at this time a curious incident occurred which had a remarkable, although temporary, effect on the progress of the work. Clemens Winkler, a professor in the Freiberg School of Mines, published a paper in which he reviewed the work hitherto done, described certain experiments, which he had carried out, all of which led him to the conclusion that the cause of previous failures could be attributed to the presence of diluting gases, such as oxygen and nitrogen. He stated that it was necessary to have sulphur dioxide and oxygen present in the theoretical proportions, and to accomplish this proposed to decompose sulphuric acid by heat into sulphur dioxide, oxygen and water, and absorb the water, thus leaving the sulphur dioxide and oxygen in the proper proportions. These were then led over heated platinised asbestos to recombine as sulphur trioxide, which was absorbed in sulphuric acid to produce oleum.

Such experimental results could now be proved faulty without further test by simply referring to the law of mass action, but this law was, at that time, imperfectly understood, and the reputation of Winkler was such that his conclusions were accepted without criticism, and no one seemed to take the trouble to repeat his experiments, which were opposed to all experience, and were soon found by Winkler himself to be fallacious. In spite of this, however, several factories sprang up

to exploit the process, and actually succeeded in making oleum on a commercial scale, although the difficulties were enormous, as anyone can appreciate who attempts to decompose such a corrosive substance as sulphuric acid in vessels constructed of any of the ordinary materials. The life of these plants was comparatively short and the cost correspondingly high.

This was the situation until about the year 1900. Winkler's results had been accepted as final for over twenty years, although there is evidence which seems to show that he had long before abandoned them himself, and was devoting his attention to the use of pyrites burner gas.

In 1901, Dr. Knietseh, of the Badische Co., in Germany, delivered his famous lecture, describing in part the work done by that company. They had long before perceived the errors in Winkler's work, and had devoted themselves to the problem of utilising pyrites burner gases with a large excess of oxygen and nitrogen, and had so well succeeded that they were able to announce that the contact process was ready to take its place, not only for the manufacture of oleum, but also as a competitor of the chamber process in the production of ordinary concentrated acid.

Notwithstanding its many defects, and in some instances what almost appear to be intentional omissions, this paper is still one of the most important written on the subject. It deals with the action of various catalysts under varying conditions of temperature and rate of flow, gives a great deal of information as to the physical properties of oleum and sulphur trioxide, and, most important of all, deals with the problems involved in the purification of the burner gas so that the danger of injuring the catalytic material is removed.

The first experiments with burner gas seemed almost without hope. After a time the contact mass lost its activity in spite of cooling, washing and filtering through various media. It was then discovered that the impurities, especially arsenic, were carried along in the form of a fine mist or fog which was very difficult to remove. To this day this mist is the major problem in the purification of burner gases, and it is not too much to say that the problem has not been entirely solved. The experiments were continued, and, finally, after some ten or fifteen years of labour, involving, naturally, very heavy expenditure, the process was placed on a commercial scale, and the production on a larger tonnage basis commenced. As is usual in such cases, other firms were working along similar lines, and the years from 1900 onward witnessed a very rapid development, not only in Germany, but also in the United States, Canada, and England.

THE CATALYST

This, then, is a brief summary of the development of the process up to the time of its comparatively rapid growth. To deal more particularly with the details, it may be as well to take up the catalyst itself first, which is, after all, the heart of the system. The usual definition of a catalyst is a substance which, without appearing among the products of a reaction, alters its velocity. This velocity of reaction is the first and

an important point to keep in mind, for it directly affects the design of any particular plant. If by altering the quantity of the catalyst, or by changing its physical condition, or by any other means it can be made more active, then the quantity of gas which can be converted in a given time will be increased and an additional output obtained with no added investment. It is quite easy to understand, therefore, why a great deal of work and expense has been, and still is, spent on this problem.

At ordinary temperatures and pressures sulphur dioxide and oxygen are entirely without action on one another. A slight combination does apparently take place with increase in temperature, but this is due to the action of the surrounding solid substances. It is a curious fact that practically all solid substances which remain solid at the temperature of reaction will cause some conversion of sulphur dioxide into trioxide. Porcelain and silica, for example, will convert a considerable percentage at a temperature of 600° C., and between these comparatively inactive substances and platinum there would be a continuous gradation of various metals, salts, etc. Up to the present, platinum is the one substance which has proved most suitable.

THE REACTION

A second point to bear in mind is that a reaction between gases does not as a rule proceed until all the original materials are used up, for the opposite reaction immediately starts and a condition of equilibrium is reached, depending in this case principally on the temperature. No matter what the catalyst, this same equilibrium will be reached at a given temperature and with the same original proportion of sulphur dioxide and oxygen. It is important to know, therefore, the most favourable temperature range and to regulate conditions so that this range will be approached as closely as possible.

A third point is the rise in temperature due to the reaction $2\text{SO}_2 + \text{O}_2 \rightarrow 2\text{SO}_3$. This feature is of interest, as it provides heat, which can be used to raise the temperature of the incoming gas to a point where the reaction will commence. The most favourable initial temperature is from 350°-400° C. The rise in temperature due to the reaction, of course, depends on the content of sulphur dioxide in the gas, and at 7% is about 180° C. The percentage conversion drops rapidly as the temperature rises above this favourable point, or, in other words, the equilibrium just referred to is disturbed and the reverse reaction becomes increasingly active. This exothermic reaction furnishes a means by heat exchange, not only of raising the temperature of the gas, but at the same time of dissipating the heat which would otherwise hold the temperature too high for the best conversion.

Strange as it may seem, for several years some of the plants operating did not avail themselves of this simple and effective plan, with the result that the expenditure for fuel was excessive and the best conversion results were not obtained.

CATALYST POISONING

The poisoning of catalysts constitutes one of the outstanding difficulties, and is the major influence in

the design of the plant, for it would be fatal if, after careful design and erection, it was found that impurities which affected the activity of the catalyst were carried into the contact apparatus.

First among these poisons is arsenic. Just why this should act as a poison to platinum as well as to human beings has never been satisfactorily explained, but the fact remains that a comparatively small amount of arsenic will seriously reduce the activity of the contact mass, and if continued for any length of time will cause it practically to cease converting. Should this happen, nothing remains but to shut down and replace the catalyst with a fresh mass, hoping in the meantime that the cause has been removed. The source of the arsenic is in the original ore if pyrites is used, but even sulphur itself contains a minute quantity. It is apparently carried along with the sulphuric acid mist formed by the slight conversion to sulphur trioxide taking place in the burners themselves, the sulphur trioxide combining with water vapour present in the air. The problem is, therefore, to remove this mist as completely as possible.

The next most important poison is chlorine, probably in the form of hydrogen chloride. This is fortunately a temporary poison, and if the source of the trouble is found and removed, the catalyst will regain its activity by a short period of intensive heating. Several other substances are included in the list of poisons, such as antimony, iodine, etc., but as they very seldom occur, are of slight importance. The activity of the catalyst may also be reduced by otherwise inactive substances, which, escaping the purifying apparatus, may deposit in the contact mass and by reducing the area exposed to the gas, affect the conversion. In spite of all precautions in the way of filtering, some fine dust is almost sure to work through in the course of years and, finally, by reducing the area or by increasing the resistance, thus using additional power, render it advisable to renew the mass.

If not occupied with such prosaic details as usually occur in every-day plant operation, one would possibly pause and consider just what was being accomplished by the apparently innocent mass of platinum. I have in mind one converter unit containing about 400 oz. of platinum, or a quantity that could be packed in a suit case, which operated continuously for some 15 years, converting in that time over 100,000 tons of SO_2 to SO_3 and finally renewed, not because its activity had decreased seriously, but for the other reason mentioned above, namely, that the resistance to the gas had increased, due to the accumulation of foreign matter, to such a point that the power required to force the gas through was excessive.

I have already mentioned that platinum at present has no serious rival as a catalyst. Ferric oxide has been, and still is, used in the Mannheim process, but the disadvantage lies in its much lower activity and consequently lower conversion with any reasonable velocity of the gas. Its only advantage is its cheapness which, however, disappears over a period of years. In the Mannheim process the ferric oxide converts about 40% and the balance has to be carried out with platinum.

CATALYST CARRIERS

Mention has already been made of the importance of exposing as large a surface as possible to the reacting gases. This brings up the subject of catalyst carriers or the material used to hold the platinum. Of the many substances proposed and tried, only two are at present in common use, magnesium sulphate and asbestos. The advantages of the former are that the platinum can easily be recovered in case of poisoning, and it requires less elaborate support in the apparatus. The monohydrate is used and calcined twice, the last time after mixing with water to render it less friable. It is then crushed and sized to about $\frac{1}{2}$ in., when it is ready for platimising.

Asbestos has the advantage of the maximum exposed surface. This can readily be appreciated, when its nature is considered. The long fibrous variety is necessary, and as this is by no means common a high price has to be paid. A preliminary treatment with hydrochloric acid is given, and after platimising the asbestos is run through a carding machine in order to tease out the fibres and thus increase the available surface.

The platinum itself is usually purchased in the form of sponge. It is dissolved in aqua regia, evaporated to dryness, taken up with water and a suitable reducing agent added. The total volume is then carefully divided into equal parts, and equal weights of asbestos immersed in the solutions. After drying and carding, the mass is distributed evenly over the supporting plates in the contact vessels and is ready for use. In the preliminary heating given before the gas is introduced into the system the platinum chloride is reduced to platinum black.

THE CONTACT VESSELS

As to the form which the contact vessels themselves take, this has been the subject of many patents. The problem consists of three major parts: first, to provide supports for the contact mass which will expose the maximum area to the gas stream and be strong enough to resist the warping action of the heat; second to provide means of removing the heat of reaction, for the conversion drops very rapidly above 500°C. , and this temperature or much higher is quickly reached with a gas containing, say, 7% SO_2 ; and, third, to provide apparatus to recover the heat of reaction and apply it to the incoming SO_2 gas, thus raising the temperature to the proper point for reaction.

The second and third parts are usually treated as one problem, one of the simplest methods being to divide the catalyst into two portions and pack into separate vessels. The gas, after passing through the first, where the temperature rises to, say, 550° and possibly 800° , conversion takes place, is passed through a tubular heat exchanger where it gives up a considerable portion of its heat to the incoming gas and enters the second vessel at a temperature of from 375° — 400° , and the remainder of the gas is converted. This gas then passes through another heat exchanger and thence to the absorbers. Operating in this way it is possible to run without any fuel at all, and we have the interesting spectacle of a self-contained unit operating with its own heat of reaction.

PURIFICATION OF THE SULPHUR DIOXIDE

We now come to what is in many ways the most important part of the process, the purification of the sulphur dioxide. Reference has already been made to the poisoning of the catalyst, and it is obvious that all possible objectionable material must be eliminated before the gas is allowed to enter the contact ovens.

So long as the contact process was confined to laboratory experiments or used as it was in the early days to recombine sulphur dioxide and oxygen produced by the decomposition of sulphuric acid, no injurious effect on the catalyst was noticed, and it was only when experiments were extended to the use of pyrites gas that the trouble commenced. A long and tedious investigation resulted in the conclusions, first that some substances interfered with catalytic action even when present in minute amounts, and second that these impurities were carried through with the white mist of sulphuric acid formed in the burners. The removal of this mist, therefore, was the major problem, and one which had to be solved if the process were to be a success. Ordinary washing with water or dilute sulphuric acid was not sufficient as the mist was not completely absorbed by either, and recourse was finally had to careful filtration, which, when efficient was found to completely remove the mist. As to the physical condition of this mist, it might be best compared to a fog, and the particles are probably of almost colloidal dimensions. Once the mist was eliminated the activity of the catalyst remained unaltered over a long period and the problem considered was at least partially solved.

The first stage in the purification is to cool the gas and eliminate the dust carried over from the burners. The successful application of the Cottrell electrostatic apparatus has been made, but the more common method is to combine the two operations in a scrubbing tower, circulating weak sulphuric acid. The tower is equipped with coolers and pumps, and may be packed with quartz, or, in the case of a dusty gas, may have no packing at all. The gas entering at, say, 500° would be cooled to 100° or less, and is then ready for filtration. The materials usually employed for this purpose are coke or quartz, the former being perhaps the most efficient. As it must be finely ground, the area has to be correspondingly great. The gas issuing from the filter is then passed through drying towers to remove the water vapour. Strong sulphuric acid is used as any moisture passing this point would condense in the latter part of the system, and form a troublesome mist with sulphur trioxide. The drying completes the purification of the gas, which is then ready for the catalyst.

ABSORPTION OF SULPHUR TRIOXIDE

Contrary to what might be supposed, complete absorption of sulphur trioxide by water to form sulphuric acid is practically impossible, and it was found that this could only be accomplished by 97-99% acid. If water or acid of much lower strength is used, an acid mist is formed which resists almost any attempt to absorb, whilst if the acid is allowed to become stronger, there will be a similar escape of sulphur trioxide without, however, the formation of the mist. This fact is of

fundamental importance, and was made the subject of a patent in the early days of the process. No matter what strength of acid may be used in other parts of the process, the final absorption must be with acid of the concentration given. Providing the strength and temperature are within the limits and the drying of the gas has been efficiently performed, the absorption of the trioxide is rapid and complete, and there should be no visible sign from the exit of the absorption apparatus that the plant is running. But if anything goes wrong with the circulation or the strength of the acid, then there is liable to be a beautiful stream of trioxide which, combining with moisture in the atmosphere, will soon call forth vigorous protests from anyone working in the vicinity. Special precautions are usually taken to give the alarm in case of mishap to the acid pumps, and the strength of the acid is kept within the prescribed limits by an interesting piece of apparatus sometimes called the electro-titrimer. This consists of two platinum electrodes immersed in a stream of the absorbing acid, the conductivity being measured by means of a Wheatstone bridge connexion and a telephone. The conductivity of sulphuric acid changes rapidly at high strengths, and this method gives instant and accurate results, so that the operator can easily regulate the stream of water used for diluting.

Of course, the fact that the strength has to be maintained within narrow limits means that a large stream of acid must be circulated. This may run as high as 100 gallons per minute, the pumps employed being usually of the centrifugal type driven directly by electric motors.

As the strength of the absorbing acid is 98-99%, this is naturally the strength of the product which is drawn off in a constant stream. As the usual strength of commercial acid is 93.2% the additional dilution is carried out in an auxiliary vessel, and the resulting product pumped to storage tanks for shipment as required.

THE PRODUCTION OF OLEUM

For the production of fuming sulphuric acid or oleum additional absorption apparatus is necessary. Depending on whether the major portion of the output is required in this form or as ordinary strength, the oleum towers may form part of the main absorption system or they may be placed in a separate location and part of the trioxide by-passed. The absorption is usually carried on in two stages, the first tower concentrating to, say, 20% free SO_3 and the second to 35% or even 40%. As in the main absorption system, heat is produced and means of cooling the circulating acid must be provided. Oleum is largely used in the explosive industry, and its advantage is, of course, the available SO_3 in the free state which can combine with the water of reaction produced in nitrating operations. 40% oleum, for example, contains 60% H_2SO_4 and 40% SO_3 . The latter can, therefore, combine with water in the ratio of $4\frac{1}{2}$ to 1 until all the SO_3 is used up and the strength of the solution is still 100%. This helps to preserve what explosive men call the water balance in their operations, and thus avoid expense in concentrating weak solutions.

During the war, of course, the consumption of oleum increased enormously as it is used in the manufacture of practically all high explosives. A somewhat serious

situation developed in England in the early months of the war, due to a shortage of sulphuric acid, and we were called on in Canada to assist as far as possible. The problem of transporting any considerable quantity of fuming acid overseas was no easy one. The first attempts almost ended in disaster. The oleum was filled in steel drums containing about half a ton, and stowed in the hold of the ship. A small leak in one of the upper tiers percolated down through the lower rows, absorbing moisture as it went, until it reached a strength where it attacked iron, and the natural result followed. More leaks occurred, and finally there was a solution in the bottom of the ship of a strength that vigorously attacked the plates. This boat was beached before the voyage had proceeded far.

The method finally adopted was to stow the drums between layers of fine coal so that any leak was absorbed and prevented from penetrating the rows beneath. In this way several thousand tons of oleum were safely conveyed across until the situation was met in England by the erection of new plants or the extension of old.

THE PLANT

Mention has been made of the various materials used in the construction of an acid plant. As long as the burner gas is above the condensing point of sulphuric acid, iron or steel can be used. Below 300° C., however, it is necessary to use lead until the gas is dried, when iron can again be used. In the absorption system cast iron has almost perfect resistance to acid of 98–100% at the temperature employed, while wrought iron or steel is rapidly attacked. For oleum the reverse is true, and steel is the material used. For shipping, steel tank cars are used for all strengths above 70% as the action at the ordinary temperatures is negligible. Of late, various alloys have been coming into use for pump impellers, valves, etc., which are exposed to exceptional wear. An alloy of 62% nickel, 21% copper, with smaller quantities of other metals, for example, possesses remarkable acid-resisting qualities, and can be used for all strengths from 20% sulphuric acid up to 40% oleum.

The handling of the large volume of gas is an interesting problem, principally one of mechanical engineering. For a plant of, say, 75 tons H_2SO_4 per day and a gas of 7% SO_2 it is necessary to move about 6200 cu. ft. per minute at 15° C. Positive pressure blowers of the Roots type are commonly used, and are installed in parts of the system where they will have only dried and purified gas to deal with.

Assuming a total resistance of 100 m. water column through the entire system, the power required will be 130 h.p., with the usual allowance for blower and motor efficiency. If power costs are high, then it is important so to design the plant that the resistance will be at a minimum after balancing the investment against the saving in power.

THE INDUSTRY IN CANADA

The sulphuric acid industry in Canada dates back some fifty years. Raw materials used were either sulphur or sulphur bearing ores, and with the exhaustion of the latter within reasonable distance, more dependence was

placed on elemental sulphur. It can easily be seen that this material, hauled principally by rail from Texas, hardly forms a cheap source of sulphur dioxide, and it was this fact that first drew attention to the sulphur gases going to waste in the Sudbury district, in the process of smelting nickel ores. For over 25 years gases containing in the aggregate several million tons of sulphur have been discharged into the atmosphere to be forever lost. The utilisation of these gases has been frequently discussed, and it may be at once admitted that the problem is not an easy one; in fact, it is extremely complicated. Apart from sulphuric acid there is the possibility of recovering the sulphur either in the elemental form or as liquid sulphur dioxide, either of which could easily be disposed of to the paper mills if the cost could compete with imported brimstone. Just here the difficulty lies. While it is quite possible to reduce sulphur dioxide to elemental sulphur by various methods, there is, up to the present, none that can be operated at a sufficiently low cost. Liquefaction of sulphur dioxide is entirely practicable by the usual method of dissolving in water, heating the solution to expel the dioxide as 100% gas, which is then easily compressed and liquefied and can be shipped in tank cars. Here again the element of cost intrudes, and the principal item is the fuel used to drive off the gas. However, it may be said that the conversion into liquid sulphur dioxide is the more promising of the two.

The manufacture of sulphuric acid is on a different basis. With a gas of reasonable concentration, and provided the plant was designed to deal with the peculiar conditions existing, then there seemed to be no obstacle in the way that could not be met by good engineering and business judgment. It was soon decided that the contact process was the proper one to use, for practically all the Canadian consumption is in the form of concentrated acid, and the success of the enterprise depended on the fact that there would be no cost for raw material, which is entirely logical, for the gases had hitherto gone to waste. With the chamber system there would, of course, be the nitrogen oxides as well as fuel used for concentrating. It would hardly be fair to state that the question of utilising these gases for the manufacture of sulphuric acid had not been discussed before, but it is a fact that the subject was usually dismissed with a shrug, and the remark that Sudbury was too far away from the consuming centres, and perhaps with the thought, unexpressed may be, that the climate was prohibitive. It was soon found, however, that Sudbury was not within the Arctic Circle, that it was almost due west and about 130 miles from Montreal, and 250 miles from Toronto. We found, further, that the freight rates were well within the economic range, after allowing for a raw material costing nothing, and that sulphuric acid could be delivered to the principal consuming points at a figure considerably below the cost of production then existing. With this basis to work on, an extended investigation was undertaken at the smelter of the Mond Nickel Co., the thoroughness of which may be judged from the fact that over 2000 gas analyses were made to prove the suitability of the gases for the contact process, for it must be understood that the direct conversion of smelter gases by this process had not

hitherto been attempted, and that these gases have quite different characteristics from ordinary pyrites or burner gas. The first condition imposed was that the manufacture of acid must not interfere with the normal smelting operations, for, of course, the output of nickel matte, which is the main operation, could not be allowed to suffer. This condition was constantly kept in mind, and has been successfully met.

The smelting of nickel ores is conducted in two stages. The crude ore containing 4–5% nickel plus copper and 17–20% sulphur, after some preliminary treatment, is first charged to the blast furnaces with coke and limestone and smelted to a matte running from 15–20% nickel plus copper. This matte is bessemerized in basic converters to about 80% nickel plus copper, which is the product shipped to the refineries. No fuel is necessary in the converters as the sulphur and iron provide all the required heat. It was found that the blast furnaces could not discharge a gas of sufficient strength for the manufacture of acid without radical changes in design, so that attention was concentrated on the converters. Nickel smelting differs from copper, which it otherwise resembles, in that the bessemerizing process cannot be carried to metallic nickel without serious loss in the slag, among other drawbacks. This is due to the fact that the oxide and sulphide of nickel do not react in the same way as the oxide and sulphide of copper. From the point of view of acid manufacture this was a very important fact, for it meant that, as there was always an excess of sulphur in the molten matte in the converter, the strength of the sulphur dioxide gas was always at a maximum. As the oxidising efficiency of a converter is almost 100%, the gas emerging is practically nothing but sulphur dioxide and nitrogen, the former averaging about 14% by volume. To remove the gas it is necessary to provide hoods and flues leading to chimneys, and as the hoods cannot be connected tightly to the converter, some air is drawn in around the hoods which serves to dilute the gas. It was at this point that the gas is taken through a separate flue to the acid plant, for, of course, we are at present only using a small percentage of the total volume. The design of the plant followed in general principles that already described, with changes suggested by the results of the investigation and to adapt it to local conditions. The gas is scrubbed and cooled with acid in a mechanical scrubber which gives an intimate contact between the two, passes through a filter filled with fine coke, is dried with strong acid, and then led to the contact vessels containing the catalyst, in this case asbestos impregnated with platinum. Incidentally, it is interesting to note that the platinum used came from the Mond Nickel Company's mines, having been recovered in the refining process. The heat exchange system is used, and the heat recovered from the reaction is almost sufficient to pre-heat the incoming gas to the required temperature. The SO_3 is then passed to the absorption towers, packed with flat pebbles, through which acid of about 99% is circulated by means of centrifugal pumps. A portion of the gas is by-passed to the oleum towers, where fuming acid up to 40% free SO_3 is made by circulating in exactly the same manner as the absorption towers. The centrifugal pumps used for all except the scrubbing towers

are of chilled iron with impellers made from a nickel-chromium alloy. This alloy has remarkable acid-resisting properties, and is used for all strengths from 20% to fuming acid and at temperature up to 225° F. without appreciable signs of wear. The final product is an exceptionally high-grade acid free from all impurities, except a trace of iron, and is almost water white.

The quantity of sulphur dioxide escaping in the Sudbury district is many times greater than the available market for sulphuric acid in Canada. Altogether, some 500 tons of sulphur are discharged per day in the air as sulphur dioxide, or the equivalent of 1500 tons of sulphuric acid. The present consumption in Canada is about 200 tons per day, so we are still a long way from utilising the total sulphur for this purpose.

A start, however, has been made in the construction of the Comston acid plant, which assures Canadian consumers of a source of this important material at a cost which is already below that prevailing in the United States, and which should encourage its extended use. It is hardly necessary to emphasise the importance and advantages to Canada of a cheap source of sulphuric acid, controlled within the Empire. Of the 75,000 tons at present consumed, oil refining and sulphate of ammonia account for the largest part, over 50%. Explosives and the pickling of steel are close thirds, followed by industries such as tanning, textile and dye works, and others too numerous to mention. Even the humble storage battery is making itself felt, and is using a rapidly increasing tonnage. As Canada grows, so will the increased consumption in all of these lines lead to further use of sulphuric acid and to the extension of the plant which we have been describing, which is the first attempt to utilise the sulphur in the Sudbury ores, thus creating a new and important natural resource.

THE BUREAU OF CHEMICAL ABSTRACTS

More than three years have passed since the Councils of the Chemical Society and the Society of Chemical Industry agreed to make a combined effort in the co-ordination of abstracts, and entrusted the Bureau with the task of exploring the situation. The present moment, when the first joint index covering abstracts in both pure and applied chemistry is about to appear, seems appropriate for taking stock of the developments which have followed the establishment of the Bureau.

The opinion has been frequently expressed that the ultimate aim should be not merely the unification of the abstracts published by the two British societies, but the issue of *one* abstracts publication in the English language. This wider collaboration had been the subject of conference with American chemists on previous occasions, but at an early stage in the Bureau's activities the suggestion was made to the American Chemical Society that the question should be examined afresh. Those most closely associated with "Chemical Abstracts," however, after giving the suggestion their sympathetic consideration, felt unable to proceed further in the matter, and a reasoned statement, setting forth the American point of view, was communicated to the Bureau.

In these circumstances the Bureau settled down to

the more limited problem of unifying the abstracts published separately by the Chemical Society and the Society of Chemical Industry. The basic facts of the situation to be tackled three years ago were the different formats employed, the overlap in the preparation and production of abstracts, estimated at about 10 per cent., and differences in type, method of presentation, and indexing. A further fact, which turned out to have an important bearing on the degree of unification attainable, was that while the Chemical Society had already dissociated its abstracts from its Journal, the abstracts in applied chemistry were closely linked to the weekly publication of CHEMISTRY AND INDUSTRY.

It looked at one time as if the efforts to find some agreed line of advance towards unification were to end in failure, and about eighteen months of negotiation between the Bureau and the two societies were necessary to secure the measure of co-ordination now adopted. The essential points in the proposals finally accepted were (a) that both sets of abstracts should be printed in double column, quarto size, in the type hitherto used by the Chemical Society; (b) that the existing overlap should be eliminated; and (c) that a joint index covering both sets of abstracts should be produced. The first year of publication on the new basis has now been completed, the initiation of the changes being marked by the adoption of the title "British Chemical Abstracts" to cover both sections.

Outwardly, the most notable feature of the new arrangements has been the change in the format of the "A" abstracts, and it must be recognised that this has meant a big concession on the part of the Chemical Society. On both practical and sentimental grounds one dislikes an alteration in the accustomed size of periodicals, and it is natural that the adoption of the larger format has been unwelcome to many regular readers of the "A" abstracts. A reasonable faith, however, in the desirability of the ends to be attained reconciles one to the less attractive aspects of a forward movement.

As to the abstracts in applied chemistry it will probably be admitted by everyone that the adoption of the type and set-up previously used by the Chemical Society has led to an enormous improvement in appearance and legibility. Any increase in expenditure which this change has involved has been well worth while.

Along with the more obvious alterations to which reference has been made, various changes of a minor character have been introduced, such as the continuous pagination of the "A" section, the saving of space between successive abstracts in both sections, a more economical form of the "A" monthly author index, and the publication of the "B" abstracts in a complete block fortnightly, instead of in weekly instalments.

An essential feature of the Bureau's co-ordinating work is the joint index, covering both sections of the abstracts, and due to appear very shortly. This has proved a big undertaking, involving the preparation and sorting of about 50,000 index cards, and the task has been rendered exceptionally difficult this year because of differences in the systems of indexing

hitherto used. By next year these difficulties will have been surmounted, and a model for future indexes will be available.

During 1926 the Bureau published 11,053 abstracts of papers, and 4220 abstracts of patents. Although, on financial grounds, the Bureau cannot emulate the comprehensive sweep of the American net, every effort is made, by a systematic review of the available sources of information, to ensure that all novel matter of real chemical interest finds a place in "British Chemical Abstracts." In respect to the trustworthiness of its abstracts, the promptness of their appearance, and their legibility, the Bureau believes that it has achieved a high standard, in maintaining which the Editor is supported by a group of Assistant Editors, each an expert in a particular branch.

Apart from minor improvements which may be introduced from time to time, it seems as if the Bureau had secured the maximum extent of unification possible in existing circumstances. The ideal of a single abstracts publication, issued independently of the Journals of the two Societies, cannot be realised so long as the close association of the "B" section with CHEMISTRY AND INDUSTRY is considered vital. The work which the Bureau has already accomplished does, however, represent a notable co-ordination of chemical effort, and a few years' experience of this joint enterprise may prepare the way for a still further advance.

JAMES C. PHILIP

CANADIAN PULP AND PAPER INDUSTRY

The Lake St. John Power & Paper Co., Ltd., has commenced the construction of its mill at Mistassini, Lake St. John district, Quebec, and it is expected to be operating before the end of the year. The development contemplates an output of 220 tons newsprint daily, with arrangements for subsequent increase to 400 tons. The company holds, under lease from the Quebec Government, limits covering 1000 square miles of splendid timber lands situated on the Mistassini and Aux Rats rivers, and estimated to contain 6 million cords of pulpwood. The company will obtain, for the present, power from the Duke-Price Power Co., Ltd.

The largest pulp and paper mill in the world will be erected on the Campbell river, on the north-east coast of Vancouver Island, B.C. The ultimate capacity will be 1000 tons newsprint daily. The motive power will be obtained from the Campbell river falls. The site of the mill will be at Duncan Bay or Menzies Bay. The cost of construction will be in the vicinity of \$50,000,000, but the first unit, which will be immediately constructed, will have a capacity of 200 tons, and additions will be made until the full capacity of 1000 tons has been reached. The promoters are the Crown Willamette Paper Co., of San Francisco. This company dominates a number of large pulp and paper concerns in California and other north-western states, and is one of the wealthiest organisations in the industry. The company last year took over the large mills of the Pacific Mills, Ltd., at Ocean Falls, B.C., and are operating them. The company has obtained a lease of large limits, with plentiful supply of pulp wood.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICE

Annual Meeting, Edinburgh, 1927

PROGRAMME

MONDAY, July 4.

8-10 p.m. The North British Station Hotel—Informal Reception by the Chairman and Committee of the Edinburgh and East of Scotland Section, followed by Conversation.

TUESDAY, July 5.

9.30 a.m. Committee Room, University Union—Council Meeting.

10 a.m. Debating Hall, University Union—Welcome by the Lord Provost of the City of Edinburgh; Welcome on behalf of Edinburgh University by the Vice-Chancellor.

Annual General Meeting of the Society of Chemical Industry (for Members only).

Presentation of the Society's Medal to Lieut.-Col. G. P. Pollitt, D.S.O.

11 a.m. Debating Hall, University Union—Address by the President—Francis H. Carr, C.B.E. A panoramic photograph will be taken after the President's Address.

1.15 p.m. North British Station Hotel—Luncheon by invitation of the Edinburgh and East of Scotland Section. Representatives of the Edinburgh Town Council, and of the Universities of Edinburgh, St. Andrews, and Aberdeen will be present.

3.30 p.m. Garden party

8.30-1 a.m. Palais de Danse—Reception by the President, and Dance.

WEDNESDAY, July 6.

10 a.m. Medical Chemistry Classroom, Medical Buildings, The University.

Joint Meeting with the Biochemical Society—Subject of discussion: "The Physiological and Industrial Aspects of the Chemistry of Carbohydrates."

10 a.m. Midwifery Classroom, Medical Buildings, The University.

Meeting of the Chemical Engineering Group—Subject of discussion: "Paper."

2.15 p.m. Visit to University Chemical Laboratories, King's Buildings, Edinburgh.

4 p.m. Reception by invitation of the University Court in the Upper Library Hall, Old University Buildings.

7.15 for 7.30 p.m. North British Station Hotel—Annual Dinner of the Society.

THURSDAY, July 7.

10 a.m. Medical Chemistry Classroom, Medical Buildings, The University.

Address by the Society's Medallist—Lieut.-Col. G. P. Pollitt, D.S.O., on the "Development of the Synthetic Ammonia and Nitrogen Industry in Great Britain."

11 a.m. (Same room). Paper (to be arranged).

12 noon. (Same room). Paper by Prof. J. Read, University of St. Andrews.

10 a.m. Midwifery Classroom, Medical Buildings, The University.

Meeting of Fuel Section of the Society—Subject of discussion: "Coal Cleaning."

Afternoon—Meeting of the Fuel Section continued. Visit to the paper mills of Messrs. James Brown & Co., Ltd., Penicuik.

Visit to Castle Mills, Edinburgh, the works of The North British Rubber Co., Ltd.

8 p.m. City Chambers, Edinburgh—Reception by the Lord Provost and Magistrates of the City of Edinburgh.

FRIDAY, July 8.

Excursions.

(1) Whole day excursion to Melrose, Abbotsford, Dryburgh, and Peebles.

(2) Afternoon excursion to Forth Bridge and Incheolm.

Conducted tours of Old Edinburgh will be arranged on Thursday and Friday.

HEADQUARTERS IN EDINBURGH

The Office of the Society during the meetings will be in the North British Station Hotel, Princes Street, Edinburgh.

Members may have their letters sent to them, c/o The Society of Chemical Industry, at the office address given above.

RAILWAY FACILITIES

The Railway Companies of Great Britain (except the Metropolitan, the Metropolitan District, and London Electric Railway Companies) have agreed to issue tickets at the ordinary single fare and one-third for the double journey to persons travelling to Edinburgh to attend the meeting. Tickets will be available from Saturday, July 2, to Saturday, July 9.

It is urgently requested that all persons going by rail to Edinburgh for the meeting will take advantage of this concession.

ACCOMMODATION

No single bedrooms are now available in the North British Station Hotel—the Headquarters of the Society—and only a few double rooms (with two beds) are still available.

Single room accommodation for both men and women is still available in the University Hostels. Immediate application for such should be made to the Hon. Secretary of the Section—Dr. W. T. H. Williamson, 13, George Square, Edinburgh.

A list of other hotels was published in *CHEMISTRY AND INDUSTRY* for February 4, 1927, p. 105.

It is hoped that a lounge and writing room adjoining the office in the North British Station Hotel will be reserved for the use of members during the week of the meetings.

The women students' common room in the Medical Department of the University will also be reserved as a reading and writing room for the use of members.

BEILBY MEMORIAL AWARDS

From the interest derived from the invested capital of the Sir George Beilby Memorial Fund, at intervals to be determined by the administrators, representing the Institute of Chemistry, the Society of Chemical Industry, and the Institute of Metals, awards will be made to British investigators in science to mark appreciation of records of distinguished original work, preference being given to investigations relating to the special interests of Sir George Beilby, including problems connected with fuel economy, chemical engineering, and metallurgy.

Awards will not be made on the result of any competition, but in recognition of continuous work of exceptional merit, bearing evidence of distinct advancement in knowledge and practice.

The administrators of the fund are the Presidents, Honorary Treasurers and Secretaries of the three participating institutions.

AMERICAN SECTION

The February meeting was held on February 11, 1927, in Rumford Hall of the Chemists' Club, as a joint meeting with the New York Section of the American Electrochemical Society and American Section of the Société de Chimie Industrielle. The meeting began at 8 p.m., with Dr. Allen Rogers in the chair.

The principal speaker of the evening was Prof. Edward Bartow, of the University of Iowa, who dealt with the subject of "Sewage and trade wastes." Prof. Bartow described the activated sludge process and illustrated his remarks with slides of various large-scale sewage disposal plants. He then spoke of the treatment of waste from corn products plants and summarised the tremendous reductions made in the population equivalent of the waste by more careful manufacturing operations. The paper will be published in full at a later date.

Following the remarks of Prof. Bartow, Prof. D. D. Jackson discussed the methods of treatment used by New York City of distribution in the surrounding water. This capacity is largely taken up at the present time so that in the not distant future other means must be used.

Mr. E. B. Besselièvre described a proposed activated sludge plant for New York City, and outlined the legislation regarding sewage and trade waste in other States. Mr. William R. Copeland followed with a discussion of conditions in Connecticut and the problems involved by State lines. Discussion by members and guests followed.

Seventy-five members and guests attended the dinner in the club dining room preceding the meeting, and about 150 attended the meeting.

NEWCASTLE SECTION

Mr. Alfred Rudge presided over the meeting held in Armstrong College on March 2.

The Saville Shaw Medal was presented by the Chairman to Mr. T. G. Pearson, a student of Armstrong College, for research work upon the subject of "The action of sulphuretted hydrogen upon mono-hydrated ferric oxide." This medal is presented annually to the student of chemistry or metallurgy who has performed

research work of especial merit. Mr. Pearson is a native of South Shields, where he attended the High School, and is now reading for an Honours degree in Chemistry. After the presentation of the medal, Mr. Pearson read a paper by himself and Dr. P. L. Robinson upon the above work.

In the discussion which followed, Dr. G. Weyman remarked that the authors had tackled a difficult subject in dealing with the sulphides of iron. He himself had put his foot into this problem some years ago and had not, he was afraid, got it out yet.

Dr. W. B. Davidson expressed great appreciation of the paper, and suggested that the work should be extended to other temperatures. He looked forward to seeing the paper in print, as he thought it constituted a distinct advance in our knowledge of a reaction of great industrial importance, which was at present very little understood.

Prof. H. V. A. Briscoe supported the remarks of Dr. Davidson, and explained to the members present that this paper was the result of a new departure in the methods of practical instruction at Armstrong College, whereby the better students were afforded opportunities of engaging in research work as a part of their regular instruction in inorganic chemistry for the bachelor degree. The problems were specially chosen to afford a similar training in practical work to that ordinarily given.

The second paper was given by Mr. G. M. Nave, B.Sc., upon "Apparent specific gravity and porosity: A comparison of various methods."

SOUTH WALES SECTION

A joint meeting of the South Wales Sections of the Society of Chemical Industry and the Institute of Chemistry was held at the Technical College, Swansea, on March 16, when a paper was read by Mr. E. A. Tyler, M.A., F.I.C., entitled "Further notes on pure chemicals." The chair was taken by Mr. C. M. W. Grieb.

The paper was illustrated by means of lantern slides setting forth comparative results obtained on British and foreign analytical reagents, chiefly potassium compounds. The continued improvement in quality of the reagents of certain British firms was in evidence, but sometimes wide variability of purity was found. The lecturer stated that this fault was not peculiar to British products. At the same time he regretted that products had been examined which fell far below A.R. standards, although obtained under this designation. Attempts made to improve both the delicacy and accuracy of methods of detection of impurities were outlined, especially in relation to the occurrence of nitrates and chlorides. Dealing with chlorides, an account of a promising method of detection and estimation, founded on physico-chemical principles, was given in some detail, and the results obtained showed that the method might become valuable. However, many more compounds remained to be examined before any claim for its general utility could be advanced.

An interesting discussion followed, in which Dr. Coates, Messrs. Grieb, Green, Godsell, and Dunn took part. After Mr. Tyler had replied, a very cordial vote of thanks was accorded him for his interesting and valuable paper.

CALENDAR OF FORTHCOMING EVENTS

- Mar. 25. **CHEMICAL ENGINEERING GROUP.** *Joint meeting with the Institution of Mechanical Engineers.* Storey's Gate, S.W.1, at 5.15 p.m. "Lubrication," by Dr. W. R. Ormandy.
- Mar. 25. **SOCIETY OF CHEMICAL INDUSTRY, Glasgow Section.** Messrs. Ferguson & Forrester's Restaurant, 36, Buchanan Street, Glasgow. *Annual Business Meeting*, at 6.30 p.m. Also a joint smoker with the Glasgow and West of Scotland Section of the Institute of Chemistry, at 7.30 p.m.
- Mar. 25. **SOCIETY OF CHEMICAL INDUSTRY AND INSTITUTE OF CHEMISTRY, Newcastle Sections.** Jointly with the Newcastle Chemical Industry Club. *Annual Dinner*, at Messrs. Tilley's Restaurant, Blakett Street, Newcastle, at 7.30 p.m. Amongst those who have promised to attend are Sir George and Lady Renwick, Prof. Arthur Smithells, Dr. J. T. Dunn, and the President of the Society of Chemical Industry, Mr. F. H. Carr, C.B.E.
- Mar. 29. **ROYAL MICROSCOPICAL SOCIETY.** Conference at 30 & 31. Liverpool University.
- Mar. 29. **HULL CHEMICAL AND ENGINEERING SOCIETY.** Hull Photographic Society's Rooms, Grey Street, Park Street, Hull, at 7.45 p.m. "Works filtration," by R. B. Foster.
- Mar. 30. **OIL AND COLOUR CHEMISTS' ASSOCIATION.** Ninth Annual Dinner, Hotel Cecil, Strand, W.C.2
- Mar. 30. **INSTITUTE OF CHEMISTRY, Belfast and District Section.** Royal Belfast Academical Institution, at 7.30 p.m. "Some experiments on the nutrition of poultry," by Prof. G. Scott Robertson.
- Mar. 30. **FARADAY SOCIETY.** Second (Experimental) Report on Atmospheric Corrosion, by Dr. W. H. J. Vernon, will be read and discussed in the Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 3 p.m.
- Mar. 30. **SOCIETY OF CHEMICAL INDUSTRY, Nottingham Section.** The Annual Meeting, University College, Nottingham, at 7 p.m. At 7.30 p.m. a public meeting will follow, when a paper on "Accessory agents in biochemical and physiological reactions," will be read by Prof. A. R. Ling.
- Mar. 31. **SOCIETY OF CHEMICAL INDUSTRY.** *Joint meeting of the Manchester Section and the Chemical Engineering Group, together with the North-Western Section of the Institution of Mechanical Engineers.* in Manchester, for a further discussion of the paper on "Lubrication," by Dr. W. R. Ormandy.
- Apr. 1. **SOCIETY OF CHEMICAL INDUSTRY.** *Joint meeting of the Chemical Engineering Group and the Institution of Mechanical Engineers,* to be held at Storey's Gate, St. James's Park, S.W.1, at 6 p.m. "Lubricating oils—laboratory tests in relation to practical results," by A. G. Marshall and C. H. Barton.
- Apr. 1. **SOCIETY OF CHEMICAL INDUSTRY, Manchester Section.** Annual General Meeting, 16, St. Mary's Parsonage, Manchester, at 7 p.m. "The work of the National Physical Laboratory," by Dr. W. Rosenhain.
- Apr. 4. **SOCIETY OF CHEMICAL INDUSTRY, London Section.** *Joint meeting with the Fuel Section.* Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. "The international conference on bituminous coals at Pittsburgh," by Dr. R. Lessing.
- Apr. 5. **SOCIETY OF CHEMICAL INDUSTRY, Birmingham and Midland Section.** University Buildings, Edmund Street, Birmingham, at 7.15 p.m. "Ultra violet light," by A. A. King.

CHEMICAL SOCIETY

The President, Prof. H. Brereton Baker, C.B.E., F.R.S., before proceeding with the ordinary business of the meeting held on March 17, referred with deep regret to the death of the immediate Past President, Dr. A. W. Crossley, C.M.G., C.B.E., F.R.S., Fellows meanwhile standing. It was also announced that the Council had proposed Prof. Dr. Richard Willstätter for election as an Honorary Fellow.

Dr. F. G. Mann described—

Tetrachloro - (triaminopropane γ - monohydrochloride) - platinum, a new type of optically active complex salt.

In tetrachloro- (triaminopropane monohydrochloride)-platinum, (J., 1926, 129, 2681), the platinum is co-ordinated to four chlorine atoms and to two of the three amino-groups of the triaminopropane molecule, the third amino-group being thus free for normal salt formation with acids. Hence, although the complex itself is neutral and non-ionic, the compound in aqueous solution furnishes one chlorine ion. Such a compound might exist in two isomeric forms, the platinum being co-ordinated either to the $\alpha\beta$ -diamino groups (I) or to the $\alpha\gamma$ -diamino-groups (II).

In the former compound, asymmetry is induced in the central carbon atom of the triaminopropane molecule by the disposition of the co-ordination linkings, since this atom thus becomes linked to an aminomethyl group ($\dots \text{NH}_2 \cdot \text{CH}_2 -$) on one side and to a methylene ammonium radical ($-\text{CH}_2 \text{NH}_3 -$) on the other side. This compound should therefore be capable of resolution into optically active forms, whilst the isomeric compound (II) should not be so resolvable.

Fractional recrystallisation of the camphorsulphonates has given the optically pure *l*-base-*d*-sulphonate and *d*-base-*l*-sulphonate, which in turn have furnished the *l*- and *d*-monohydrochlorides having $[M]_{5461}^{15^\circ} -502^\circ$ and $+501^\circ$ respectively. The compound is therefore the γ -monohydrochloride having the constitution (III), the metal being co-ordinated through the $\alpha\beta$ -diamino-groups. This is the first recorded case of a carbon atom owing its asymmetry to the operation of auxiliary valencies.

Dr. N. V. Sidgwick remarked that the formation of a 5-membered ring when either a 5- or a 6-membered ring was possible demonstrated the greater stability of the former when double linkings are absent.

In reply to Dr. J. Kenyon, Dr. Mann said that the asymmetry of the central carbon atom was actually realised in aqueous solution, the addition of water, followed by ionisation and loss of asymmetry, being

prevented by co-ordinating the $\alpha\beta$ -diamino-groups with platinum.

Dr. A. B. P. Page discussed :

The Activation of Wood Charcoal by Progressive Oxidation, in relation to Bulk Density and Iodine Adsorption.

THE difficulty of preparing charcoal with definite adsorptive properties has always prevented a satisfactory study of the change of activation with conditions of heat treatment. In this work, great care was taken to make a large quantity of wood charcoal of uniform quality. This standard charcoal was oxidised under accurately controlled conditions of temperature, time of treatment, and composition and rate of passage of the mixture of oxygen and nitrogen used in the oxidation. The bulk density of the treated charcoal was determined, and its capacity for removing iodine from solution in benzene. Adsorption isotherms were obtained for each charcoal and the Freundlich constants evaluated. At most temperatures the bulk density falls off smoothly with increasing oxidation. The variation of the two Freundlich constants is reciprocal. The exponent decreases and then increases rapidly with increasing oxidation, subsequently showing a much slower decrease. It is suggested that the rapid changes correspond with a change in the effective number of attracting centres per unit of charcoal surface, whilst the slow change corresponds with the increase of surface per gram of charcoal, indicated also by the bulk density curves.

The President asked why an ashless charcoal had not been selected for the experiments. The author had burned off the surface layer, getting nearer to the ash, producing a thinner layer of carbon which might be expected to show increased activity. With ashless charcoal, however, other workers might hope to obtain comparable results.

Prof. J. C. Philip said that he was originally responsible for the choice of birch charcoal in Dr. Page's work, and admitted the desirability of carrying out similar experiments with sugar charcoal. This was now in hand, but even sugar charcoal would probably present difficulties from the point of view of reproducibility of results.

Dr. S. Sugden discussed :—

The Parachor and Chemical Constitution. Part V. Evidence for the Existence of Singlet Linkings in Phosphorus and Antimony Pentachlorides.

THE parachors of phosphorus and antimony pentachlorides are lower than the sum of the atomic constants by 26 units. Since the additive nature of the parachor has been verified for a large number of substances, this is taken to mean that the pentachlorides possess a type of linking which has not been met with in the compounds previously studied.

From a discussion of electron valency formulae and the effect of the number of electrons in a linking on the structural constants for unsaturated linkings, it is concluded that these compounds contain two singlet linkings, each consisting of one electron held in common by two atoms.

The electronic theory of valency is extended to include linkings composed of an odd number of shared electrons,

and is applied to the formulation of higher halides, co-ordination compounds, and "molecular" compounds for which, hitherto, it has not been possible to write electronic formulae without violating the octet rule.

Prof. T. M. Lowry said that the magnitude of the deficiency was identical for phosphorus pentachloride and oxychloride; the explanation that the fifth valency is an electrovalency instead of a covalency was equally valid in both cases. The new data were therefore in harmony with the polar formula $[\text{PCl}_4]^+ \text{Cl}^-$. Dr. Sugden's arguments were invalidated by the fact that, although he had made an allowance for the increment for $\cdot\cdot\cdot$ to \cdot (assumed to be the same as for $\cdot\cdot\cdot$ to \cdot and \cdot to $\cdot\cdot\cdot$) in deducing a value for the single-electron linking, he had ignored it in calculating a value for the polar formula. The parachors therefore afforded no evidence for the existence of single-electron linkings, although this might, perhaps, be justified on other grounds.

Dr. N. V. Sidgwick said that the author had obviously discovered a method of great value in investigating molecular structure. However, to accept his latest interpretation would necessitate abandoning the idea of correlation between the structure of a linking and its behaviour. Singlet linkings should be weaker than doublets, and the only certain singlet linkings are known to be weak. The remarkable stability of SF_6 , however, does not accord with the view that four of the fluorine atoms are attached by singlet linkings.

Prof. C. K. Ingold considered that the author's physical evidence for the existence of pairs of singlets in phosphorus and antimony pentachlorides was very strong; the behaviour of these compounds as substituting agents provided chemical justification for the view. This was true also of iodine trichloride, the aryl iodide dichlorides, and probably the polyhalide ions. Sulphuryl chloride functioned in a dual capacity as a substituting agent, and its structure admitted of a distribution of charges between the oxygen and chlorine atoms. Prof. Ingold criticised the author's formula for nitric oxide, and referred to the tendency of the singlet linkings to arise in pairs, possibly deriving their stability from some form of mutual association.

Dr. Sugden replied that, although the anomaly found for the pentachlorides equals the difference between the constants for a non-polar and a semi-polar double linking, it did not follow that the effect could be ascribed in both cases to the substitution of a polar linking for a covalency. The semi-polar double linking, which consists of a covalency and a polar valency, has a constant of 1.6 in a large number of substances; since the effect of a covalency is zero, the effect of a polar valency should also be 1.6 unless the additive relation breaks down. The small effect of a polar linking on the parachor is demonstrated by measurements on the hydrogen halides. It was difficult to believe that the pentachlorides contain an electrovalency whereas the hydrogen halides do not. In the cobaltamine series the electrons responsible for the Bohr magnetons probably reside in the M -level; in the suggested formulae, as in the old ones, there are many more electrons in this level than the observed number of magnetons. The analogy with the structure

of the inert gases could not be very strongly stressed for an energy level well within the atom. Reactivity depends not only on the type of linking, but also on the type of atoms linked and the nature of the second molecule. The stability of carbon tetrachloride, involving only an ordinary chemical single linking, was almost as great a puzzle as that of sulphur hexafluoride.

BIOCHEMICAL SOCIETY

The annual general meeting was held in the Department of Physiology and Biochemistry, University College, Gower Street, W.C.1, on March 18.

The following communications were read:

"Carbohydrate metabolism of the brains of normal and diabetic animals," by B. Holmes and E. Holmes.—The authors briefly discuss the evidence which has led them to the conclusion that the brain contains no reserve of lactic acid precursor, and therefore depends entirely on the blood sugar for its supply of such precursor. Under anaerobic conditions the brain rapidly forms lactic acid from added glucose, under aerobic conditions the tissue readily compasses the disappearance of lactic acid. They quote figures to show that the amount of lactic acid in the brain immediately after death runs parallel with the level of the blood sugar at the moment of killing, in conditions both of extreme hypoglycaemia, and of hyperglycaemia. They describe experiments on depancreatized and on normal cats, showing that after pancreatectomy, lactic acid formation, both from the sugar of the blood in the living animal, and by the excised tissue *in vitro* (from added glucose), takes place as in the normal animal. Further, under aerobic conditions, the excised tissue still brings about the removal of lactic acid.

"Phosphagen," by P. Eggleton and M. G. Eggleton.—The substance phosphagen which is present in striated muscle, and which disappears therefrom in rapid fatigue, has been isolated from the skeletal muscles of the rabbit. Its barium salt has many of the properties of a hexose monophosphate, and is soluble even in 30% alcohol. It is always accompanied by another hexosemonophosphoric acid the barium salt of which is slightly less soluble in alcohol. The latter does not show the instability in acid which is characteristic of phosphagen. The purest sample of phosphagen obtained so far contains 7.95% of phosphorus and 40.4% of BaO, but its copper-reducing power (Folin technique) is very low even after hydrolysis. Phosphagen has been found in the skeletal muscle of the guinea pig and the tortoise. There appears to be a correlation between the "synthetic" ability of a muscle under the influence of fluoride, and its phosphagen content, since unstriated muscle, which contains little or no phosphagen, fails to show any "synthetic" ability.

"The phosphorus of caseinogen," by C. Rimington and H. D. Kay.—A phosphorus-containing peptone has been isolated from tryptic digests of caseinogen in a yield representing 50% of the organic phosphorus. It possesses the formula $C_{37}H_{73}N_9P_3O_{33}$, forms well-defined copper, silver and barium salts, is strongly laevorotatory with $[\alpha]_{D}^{20} = -77.16$, and behaves on titration and in formation of its salts as a 9-basic acid. This substance, which has been named phosphopeptone, is readily

soluble in water giving solutions which react acid to litmus. It cannot be crystallised, but passes with ease into the form of a transparent vitresoid mass. Two of the three atoms of phosphorus which it contains are detached as phosphoric acid by bone phosphatase: the remaining atom is, however, removed by kidney phosphatase. In this respect phosphopeptone resembles exactly tryptic digests of caseinogen in which also bone phosphatase will hydrolyse only two-thirds of the organic phosphorus, and appears, therefore, to be a representative fraction. The ratio total nitrogen/amino nitrogen in phosphopeptone is 9/1, and after acid hydrolysis becomes unity. From the hydrolysis products hydroxyglutamic acid has been isolated in a yield corresponding to two molecules per molecule of peptone. Other hydroxyamino acids are present, and among them most probably serine. The phosphorus in caseinogen is held in ester linkage. Phosphopeptone is very slowly attacked by pancreatic juice, both peptide and phosphorus linkages being opened up. The phosphorus is removed as phosphoric acid by 1% sodium hydroxide at 37°.

"The dual nature of vitamin B," by M. H. Roscoe.—The identity of the anti-neuritic vitamin, necessary for the cure of polyneuritis in pigeons, with the water-soluble vitamin B, needed for growth in rats, has been much discussed, and differences pointed out in their quantitative distribution, stability in the presence of heat, and solubility in alcohol, etc. Goldberger describes a pellagra-preventive factor, which is present in watery solutions of autoclaved (anti-neuritic free) yeast, and which is necessary to rats, both for growth and for the prevention of a pellagra-like condition. In the experiments undertaken Peters' 50% alcohol yeast extract, though curing neuritic symptoms in rats, neither enabled them to grow nor prevented the onset of a pathological condition of the skin (the pellagra-like condition of Goldberger). This was cured, however, by yeast autoclaved for 5 hrs. at 120° C., and growth was restored. The autoclaved yeast had no effect on the neuritic symptoms, and in the absence of the extract did not allow growth. Wheat germ has also been tested. Its anti-neuritic content was similar, but the "pellagra-preventive" content was much lower than that of yeast. The water-soluble vitamin B necessary for the growth of rats can thus be divided into an anti-neuritic factor and a "pellagra-preventive" factor. Both are necessary for growth.

"Some sterol colour reactions in their relation to vitamin A," by O. Rosenheim.—An attempt was made to throw light on the nature of the chromogen concerned in the blue colour reaction of cod-liver oil with $AsCl_3$ (or $SbCl_3$), which is considered as specific for vitamin A. It was found that treatment of cholesterol with benzoyl peroxide in chloroform solution produced a chromogenic substance which gave with the same reagents a blue colour, apparently identical with that produced with cod-liver oil. Although the resemblance of the two chromogens is striking in several respects, their identity is excluded by the fact that the artificial chromogen is destroyed immediately when added to any oil. Cholic acid also gives rise to a similar colour reaction when heated with benzoyl peroxide in chloroform solution.

This reaction again demonstrates the near relationship of the bile acids to cholesterol, which has been definitely established by the work of Windaus. The similarity of these colour reactions to the one of the chromogen of cod-liver oil suggests that there exists a similarity between the carbon-ring system of the sterol molecule and that of the unknown chromogen, and lends support to the view that oxidative changes in the sterol molecule may be concerned in the vitamin A formation. In view of the near relationship which has recently been shown to exist between ergosterol and vitamin D, the possible relation of vitamin A to the oxidation products of ergosterol is being investigated.

The following communications were also read:

"Observations on the sulphhydryl-disulphide system," by R. K. Cannan and B. C. J. G. Knight. "Estimation of adrenaline," by L. C. Baker and G. F. Marrian. "Observations on the adrenals of rats with relation to vitamin B," by L. C. Baker, G. F. Marrian and J. C. Drummond. "The relation of vitamin B deficiency to inanition in the pigeon," by S. Kon and J. C. Drummond. "The relation of certain dietary factors in yeast to growth on diets rich in protein," by A. Hassan and J. C. Drummond.

ELECTROPLATERS' AND DEPOSITORS' TECHNICAL SOCIETY

The 11th meeting was held on February 23, under the chairmanship of Mr. MacNaughtan, and Mr. T. Johnston read a paper on "The electrodeposition of iron." Mr. Johnston exhibited a comprehensive range of electrolytic iron in the various stages of manufacture of iron articles such as cores etc., used in electrical engineering, "built up" engineering parts and examples of deposits obtained in works practice.

Mr. D. J. MacNaughtan, introducing the speaker, said that iron deposition was rather an uncommon plating process, as it could hardly be used for decorative purposes. Nevertheless, its importance was indicated by the latest production figures, which showed that it was being produced at the rate of 200 tons a month in Germany and America and 60 tons per month in France.

Mr. Johnston prefaced his paper with a résumé of the history of iron deposition, and showed that progressive improvements had brought up the employable current density from 2 to as high as 240 amps. per sq. ft. There were many difficulties met with in the process, owing to the chemical and electrochemical peculiarities of iron. The depositing solutions commonly used were based on the simple sulphate and chloride solutions, or mixtures of these, three characteristic baths being the chloride solution, the sulphate solution, and the sulphate-chloride solution. In all cases it was best to use fairly high temperatures, and comparatively high current densities can be employed. Iron baths were very sensitive to slight variations in conditions, one of the most important factors being the degree of acidity.

The purity of electrolytic iron may reach 99.96-99.99%. Hydrogen, which is occluded in large quantities, is difficult to eliminate, but it is possible to effect this by suitable heat treatment. The metal is then highly ductile, and is particularly suitable for cold

working, stamping, etc. Among the most interesting applications were the "steel-facing" of printing blocks, "building up" worn and undersized parts, production of finely divided magnetic material, manufacture of tubes, sheets and strip, preparation of "pure" iron for research, and so on.

In the subsequent discussion Mr. E. A. Ollard stated that iron used for filling up blow-holes etc. had the advantage over nickel for this purpose in regard to the colour of the metal. The adhesion of the iron on steel and cast iron was good.

Mr. Lovelock said he used a cold solution for "building up" as wax was used as a stopper, and a saturated solution of ferrous ammonium sulphate at a p_H of 5.5. A bath was built round the part, and one-sixteenth of an inch could be deposited satisfactorily. Iron was preferred to nickel, not only on account of colour, but because it machined well. Mr. A. W. Hothersall said that p_H determinations could be made colorimetrically on filtered samples, though chloride solutions were apt to cloud. There was so little colour that rapid determinations could also be made with the Capillator. Another advantage that iron possessed over nickel was that it could be case-hardened, and heat treatment generally improved the properties of the deposit.

Mr. S. Wernick said that the deposition of iron was different from the plating of most common metals owing to the instability of the bath, due to oxidation. For the same reason, it had been found difficult to assign a definite value for the equilibrium potential of iron. It was not clear how the calcium chloride in the ferrous chloride-calcium bath acted, since common salt had been substituted with good results. Having regard to the importance of acidity, it was surprising that a buffer was not used. Probably the bath would become more stable as means to maintain a correct p_H were evolved.

SIR JESSE BOOT FOUNDATION LECTURE

Prof. F. S. Kipping, F.R.S., delivered the fifth annual Sir Jesse Boot lecture at University College, Nottingham, on March 11, on "Motor fuels: Present and future."

After a preliminary outline of the principles of combustion relative to hydrocarbons, Prof. Kipping dealt in turn with the three most important motor fuels, viz., alcohol, benzene (benzole), and petrol.

Alcohol is mainly produced from materials rich in starch or sugar, by fermentation processes. The world's annual production is said to be 450,000,000 galls., but of this only about 80,000,000 galls. is available for industrial purposes. Of this a large proportion is required in the making of ether, tinctures, perfumes, dyes, essences, etc., and very little is left for use as a motor fuel. Alcohol from starch could no doubt be obtained in much larger quantities than at present. Any vegetable product containing starch could be used. Although alcohol is too expensive to use alone as a motor fuel, it can be used mixed with petrol and (or) benzole. A 50-50 mixture of petrol and alcohol is sold in this country, and such a mixture (to which benzole is sometimes added) is used as an aviation spirit. The advantages claimed for such a spirit are: longer engine life, lower

maintenance costs, and although the calorific value of alcohol is less than that of petrol, more power is available because a higher compression ratio is possible.

Prof. Kipping then described the production of benzene from coal tar. Benzene is an important motor fuel, but cannot be used alone, though even if it could it would be too expensive. If the whole of the home consumption of coal, 180,000,000 tons per annum, were given over to motorists only 90,000,000 galls. of benzene would be available less than one-quarter of the amount of motor fuel required to-day.

The principal source of motor fuel to-day is petroleum or rock oil, which is a thick yellow or brown liquid, consisting of a mixture of an unknown number of hydrocarbons. The crude petroleum is fractionated and the various fractions re-fractionated. Some crudes give a motor fuel fraction which is about 50% of the whole, whilst others give none.

Prof. Kipping next dealt briefly with some of the processes which have been devised to increase and maintain our supplies of petrol.

About 40% of the crude petroleum is finally obtained as gas oil, which is not volatile enough for lamp oil nor thick enough for a lubricant. If this gas oil is "cracked," a spirit is obtained, which although different from "straight run" petrol, is a motor fuel as good or better than the straight run petrol. In this way the yield of motor fuel from the crude petrol is nearly doubled. In America nearly 40% of the petrol consumption is cracked spirit. Another small addition to motor fuel supply is obtained by "stripping" coal gas with heavy oils whereby benzene is recovered. Again, low-temperature carbonisation of coal, in the production of smokeless fuel, yields a tar which contains about twice as much benzene as "high-temperature" tar.

The lecturer then outlined the Bergius process for the conversion of coal into oil by combining it with hydrogen. In this process it is claimed that the net motor fuel would be from 20-40 galls. per ton of coal. Further research is necessary before the process can be regarded as an economic possibility; there are many difficulties, e.g. 35,000 cu. ft. of hydrogen is required per ton of coal and no sufficiently cheap method of production of this gas is available.

Coke when heated strongly with lime is converted into calcium carbide, which on treatment with water yields acetylene. Now when acetylene is heated to 650° in presence of charcoal it yields an oily product, which on fractionation yields a motor fuel; one ton of calcium carbide yields about 20 galls. of benzene. At present, however, the high price of calcium carbide does not permit the use of this method as a source of motor fuel. Again, acetylene may be converted into ethylene, which is then absorbed by sulphuric acid, the product diluted with water and alcohol obtained on distillation.

Prof. Kipping also mentioned the production of "synthin" and synthol from water gas.

The lecturer concluded by briefly discussing the possibilities which lay in the conversion of the enormous supplies of cellulose (much of it waste material) into alcohol either direct by the aid of some organism still to be discovered, or by previous conversion of the cellulose into sugar and then fermenting the sugar with yeast.

CORRESPONDENCE

THE SUGAR INDUSTRY IN SOME OF ITS CHEMICAL ASPECTS

SIR,—My attention has just been called to the note upon "The manufacture of white sugar" by Director Farnell, of the British Sugar Processes, Ltd., in your issue of February 4, with respect to my article upon the "Sugar industry in some of its chemical aspects" published in CHEMISTRY AND INDUSTRY for January 14, 1927. My paper, as indicated in the footnote, was read on January 18, 1926, before the Montreal Section of the Society of Chemical Industry, which is over a year before the publication of Mr. Farnell's note. Nearly two sugar campaigns have elapsed since my paper was written, and had I known that it was to be published I would have asked for an opportunity to bring it more completely up-to-date in several particulars. I should explain, perhaps, that the statement to which Mr. Farnell objects refers to the so-called plantation white sugar made directly from cane juice, with or without charcoal, by a single crystallisation. Of the hundreds of different samples of such sugar examined by me during a period of over 20 years, not one was found to equal the best refined granulated sugar in purity or uniformity of grade. Of course the remelting, decolorising and re-crystallising of raw sugar (using either animal or vegetable charcoals) can be performed upon the cane sugar plantation, but when this is done the product is then a refined sugar, and not a plantation white sugar according to the ordinary meaning of the latter term. I have made no personal examinations of plantation refined sugar, but have been informed that recent shipments of such sugar, refined by vegetable carbon, have been found to be inferior for some purposes to sugars refined by animal charcoal because of their higher ash content.

Respectfully yours,

C. A. BROWNE, *Chief*

U.S. Dept. of Agriculture,
Bureau of Chemistry,
Washington, D.C.
March 8, 1927.

OBITUARY

PROFESSOR ALFRED MICA SMITH, F.I.C.

The death of Prof. Alfred Mica Smith, F.I.C., nephew of the late Dr. R. Angus Smith, F.R.S., Chief Inspector of Alkali etc. Works, took place at Ballarat, Australia, on May 14 of last year. He was born in Perth, Scotland, in 1844, and was educated in his native town and in London, where he took the degree of Bachelor of Science. He was research assistant to Prof. Playfair at Edinburgh, but came to Victoria, Australia, on account of ill-health. In 1876 he became the chief of staff of the Bendigo School of Mines, and in 1881 he went to Ballarat School of Mines, where he held the position of lecturer in chemistry and metallurgy for 42 years, until he resigned some three years ago. Recently, a bust of Prof. Smith was unveiled at the school, which was presented by old Ballarat School of Mines students now living in Western Australia, and the Mica Smith Scholarship has been established in Ballarat in recognition of his work. Prof. Smith was a collector of rare china and of paintings, and two months before he died he presented his collec-

tions to the Ballarat Art Gallery. The interment took place in Ballarat, and representatives of the School Council and Staff attended the funeral to pay the last respects to their beloved friend. Prof. Smith directed in his will that £1500 should be given to the Victoria University of Manchester for the establishment of a scholarship in sanitary science, or for such other scientific purpose as the Council of the University should determine. He also directed that £300 should be held in trust, half of the income from the sum to be paid to the present students' association, and the other half to the past students' association of the Ballarat School of Mines, with which he had been associated for so many years.

ALFRED C. FRYER

PERSONAL AND OTHER ITEMS

The King has consented to become Patron of the Imperial College of Tropical Agriculture.

Sir Alfred Mond and a number of directors of the Imperial Chemical Industries Ltd., left the Croydon air station on March 21 to fly to Brussels and Paris to attend international conferences of delegates of the chemical industries from various European countries.

Sir Max Muspratt, president of the Federation of British Industries and chairman of the United Alkali Company, was entertained to dinner on March 22 by the directors and officials of the company, and was afterwards presented with his portrait in oils in recognition of his 14 years' successful chairmanship of the company. Dr. G. C. Clayton, one of the directors made the presentation.

Dr. Herbert Levinstein has been re-elected to a seat on the board of the Nura Art-Silk Co., Ltd.

Mr. John Hugh Smith, a director of the Associated Lead Manufacturers, Ltd., has been appointed a joint managing director of Hambros Bank.

Mr. F. F. Renwick has been elected to the presidency of the Royal Photographic Society.

The Ministry of Agriculture announces that it is prepared to receive applications for grants in aid of scientific investigations bearing on agriculture.

At a meeting of the University Court of St. Andrews, Principal Sir James Irvine announced that an anonymous benefactor had given £100,000 in recognition of the progress in the development of the University.

The bicentenary of the death of Sir Isaac Newton is being celebrated this week. Isaac Newton was born on December 25, 1642 (the year in which Galileo died), and died on March 20, 1727.

Sir John Turney, who established the important tanneries of Turney Brothers, at Trent Bridge, Nottingham, has died at the age of 88.

The late Rt. Hon. Sir Ellis Griffith, Bt., P.C., lately a director of the Mond Nickel Co., Ltd., left £10,884, with net personalty £5,547.

The late Mr. J. Taylor, a well-known authority on dyes, and director of the United Indigo & Chemical Co., Ltd., left £1,081.

We regret to learn of the death, at the age of 78, of

Prof. G. Krause, the founder of the "Chemiker-Zeitung," a well-known German contemporary which recently celebrated its 50th anniversary.

Dr. H. J. Müller, who died recently, aged 65, was one of the best known figures in the German portland cement industry.

Imperial Chemical Industries, Ltd.

Work on the great building which will house the staff of Imperial Chemical Industries, Ltd., is proceeding apace. Difficulties have been met with in laying the foundations, but these have been overcome. Sir Frank Baines is the supervising architect of the new building, which is situated on the Embankment, on the Chelsea side of the Houses of Parliament.

Centenary of the Friction Match

Next month the town of Stockton-on-Tees will celebrate the centenary of the invention of the friction match, by John Walker, a citizen of that town. Although Walker made the discovery in 1826, his first recorded sale was made in April 7, 1827. Walker refused, it is stated, to patent his discovery, and the production of his friction match soon spread both in Great Britain and on the Continent, until it was superseded, in 1834, by friction matches containing yellow phosphorus, which, in turn, were superseded by matches containing the non-toxic red phosphorus, the manufacture of which was patented by Messrs. Albright & Wilson in 1855.

Glass Containers for Food

In a report issued by the Ministry of Health and written by Mr. G. Hancock, M.R.C.S., on the "Occurrence of Glass Fragments in Foods packed in Glass Containers," the following conclusion is stated: "I do not think that any real objection can be taken to the use of glass containers as receptacles for food. Glass-packed foods of one or other sort, are eaten by the million daily, while glass particles of appreciable size are but seldom found in them. When present, the glass is usually in powdered or microscopic form and there is little, if any, evidence to show that in this form it is capable of exerting any injurious effect when swallowed with the food. It would, however, be unwise to accept such negative evidence as wholly conclusive, for glass, in whatever form is manifestly an undesirable ingredient in foods. It has been shown that food manufacturers are for the most part well aware of the need for using good glassware and for avoiding contamination with glass of the contents of a vessel during the various operations to which it is subjected in the factory; and it is doubtless largely due to these measures that the larger particles of glass, derived from the burstings and breakages which are inevitable in such factories, are so seldom met with in food."

The Even Dyeing of Viscose Silk

Owing to the manufacturing methods peculiar to the production of artificial silk, certain unavoidable irregularities occur in the quality of the finished product. These irregularities in turn give rise to irregular results in colouring, and it is no uncommon thing to find in an artificial silk dyehouse a large number of girls employed solely in sorting dyed material into lots which roughly match one another. The problem has engaged the

attention of dyestuff manufacturers both at home and abroad for many years, and it is most gratifying to learn that a British dyestuff firm has discovered the solution, for the British Dyestuffs Corporation has introduced a new series of colours, the "Icyl" colours, which are specially designed to yield even results on viscose artificial silk of irregular quality. The colours illustrated in the new B.D.C. pattern card of "Icyl" colours do not represent the full series; new members will be added as time goes on, and it is hoped eventually to provide for the production of every hue which may possibly be devised.

Research and the Metal Industries

An exhibition which has been arranged and opened to the public at the Science Museum, South Kensington, affords some indication of the assistance given to British metal industries by the research and auxiliary services of an industrial research organisation. The exhibit is that of the British Non-Ferrous Metals Research Association, which, with the co-operation of the industry through membership of the Association, carries on a two-fold service, firstly in the prosecution of research work either of a fundamental and scientific character or of direct practical utility, and, secondly, in maintaining a highly organised information service which operates for the general benefit of the Association as a whole and to meet the specific needs of individual member firms.

The present exhibit is concerned chiefly with eight of the Association's researches, chosen from among eighteen major investigations at present in progress. Those selected are typical of the character and wide range of the work which is being carried out, and the exhibits have been set out to give some idea of the scope of each piece of work and the progress which has so far been made.

Some indication of the range of work can be gathered from the subjects chosen for exhibition, which are as follows: (1) Effect of impurities up to 1% on the properties of copper. (2) Gases in copper castings. (3) Brass casting. The surface and internal soundness of ingots. (4) The jointing of metals. (5) Die casting alloys: Section I. Brass and bronze alloys; Section II. Aluminium alloys. (6) "Wiped" plumbers' joints. (7) Spectroscopic assay of zinc. (8) Atmospheric corrosion.

There is also shown one case which gives information in regard to the Association's administrative, library and information services, with some examples of the work normally carried out in these departments.

The exhibition is open to the public daily and literature descriptive of the material on view, and of the other work being carried out by the Association may be obtained at the Science Museum or from the Secretary, B.N.F.M.R.A., 71, Temple Row, Birmingham.

U.S. Production of Nitrogen Compounds

The U.S. Department of Commerce announces that, according to data from the biennial census of manufactures taken in 1926, nitrogen and fixed nitrogen compounds valued at \$31,409,682 were produced for sale by establishments engaged primarily in the manufacture of chemicals. This total represents increases of 3.2% and 49.1% respectively, as compared with \$30,435,909 for 1923 and \$21,059,976 for 1921.

Physical and Chemical Survey of the National Coal Resources

In connexion with the physical and chemical survey of the national coal resources, which is one of the main aspects of the fuel research work of the Department of Scientific and Industrial Research, the following committee has been appointed to deal with the physical and chemical survey of the coalfields of Durham and Northumberland:—

Mr. A. Kirkup, Dr. H. Peile, and Mr. G. Raw (representing Durham Coal Owners' Association); Mr. S. Bates, Major H. S. Streatfeild, and Mr. R. Warham (representing Northumberland Coal Owners' Association); Colonel W. C. Blackett (representing the North of England Institute of Mining and Mechanical Engineers); Prof. H. V. A. Briscoe; Dr. J. T. Dunn; Prof. G. Hickling; Prof. G. Poole; Mr. R. G. Carruthers (representing the Geological Survey of Great Britain); Dr. C. H. Lander (*ex officio*) (Director of Fuel Research); Mr. F. S. Sinnatt (*ex officio*) (Superintendent of the National Survey).

Committees are already at work in Lancashire and Cheshire, South Yorkshire, Nottinghamshire and Derbyshire, and North Staffordshire. Another committee is dealing with the coalfields of Scotland.

Chemical Treatment of Flour

The Ministry of Health has published the report of the Departmental Committee on the Treatment of Flour with Chemical Substances. Whilst the Committee recognises the importance of guarding the treatment of flour against unnecessary treatment with foreign substances, it is not prepared, on present knowledge, to recommend the complete elimination of bleaching agents and improvers, though it thinks that chlorine, nitrogen trichloride and benzoyl peroxide should not be amongst the substances used. The Committee thinks that it should be compulsory for manufacturers of chemical substances for use either as bleaching agents or "improvers," or both, to declare to their purchasers the nature of the ingredients of which they are composed, and that millers should be required to inform their customers whether their flour has undergone a process of chemical bleaching or "improving," or both, and if so with what substances and in what proportion.

REVIEWS

THE CHEMISTRY OF DYEING. By JOHN KERFOOT WOOD. New and revised edition. Pp. 97. London: Gurney & Jackson, 1926. Price: 3s. 6d.

This is a subject which has attracted much research, but agreement has not yet been reached on a subject dealing with so many fibres and varying processes, nor does it appear likely that one theory can cover the whole ground.

The work already published is so large that Dr. Wood's monograph is very welcome to students and those practical dyers who may bother about theory by summarising it in a connected way, whilst giving ample references to the original publications. The field is now being so intensively worked that already much new work has been published since this second edition was prepared.

Artificial silks should be included in the list of chief textile fibres (p. 3). It is not true, except in the most general sense, to say that viscose resembles cotton in its behaviour to dyestuffs: many direct cotton dyestuffs suitable for cotton are unsuitable for application to viscose, and the explanation, when found, will probably illuminate the theory of one branch of dyeing. It is also not true to say that cellulose acetate presents the greatest difficulty to the dyer: the excellent work done by British technologists in producing suitable dyestuffs and simple methods of application has made its dyeing a simple process which, from micro-photographs at various stages of dyeing, appears to be explained by Witt's solid-solution theory. In dealing with vat dyestuffs (pp. 14-15) the German and Swiss, but no British, generic names are given. Is it not true that British textbooks were illustrated by British examples, especially so in this case, since the production of vat dyestuffs by British manufacturers has been one of the most fruitful of their activities?

C. M. WHITTAKER

GRAPHITE. By Dr E RYSCHKEWITSCH. Pp. xii + 323. Leipzig: S. Hirzel 1926. Price: paper, 14.50 m., bound, 16.50 m.

This book gives a systematic survey of the chemical and physical properties of graphite, of its mineralogical character, and of its preparation, purification, and industrial uses. The subject is a large one, and the author is to be congratulated on having covered the ground so thoroughly within the limits of a moderate sized volume.

The first chapter deals with the chemical and physical properties of graphite, and is followed by one dealing with the mineralogy thereof. The third chapter on the winning and refining of graphite from its ores deals fully with the different processes used, ranging from simple grinding and grading to the more elaborate hydromechanical, flotation, chemical, and electro-chemical processes of refining. The following chapter is devoted to the artificial production of graphite by the Acheson and other processes. The last chapter on the applications and uses of graphite is perhaps the most interesting to the average chemical technologist. It is divided into five sections, the first four of which deal respectively with the use of graphite as a heat-resisting material for crucibles, etc.; as a conductor of electricity, as a pigment, and as a lubricant, whilst the fifth contains statistical data of the production and use of graphite. All these sections are excellent, that on graphite as a pigment containing a brief but useful summary of the manufacture of pencil 'leads'. Good author and subject indexes conclude the volume.

The book is well printed and illustrated and contains many interesting and useful graphs. It appears to be remarkably free from errors, but British geography is a slight stumbling block to the author, who transfers the counties of Merioneth and Montgomery to North Scotland, and misspells Cunnock as Cumcock. In spite of the existence of other useful books on graphite by E. Donath and H. S. Spence, this book contains so much that is specially good that it must be cordially recommended to all interested in the production and use of graphite.

PERCY MAY

REPORT

Report of the Committee of the Privy Council for Scientific and Industrial Research for the Year 1925-26. (Cmd. 2782. Pp. iv + 178. H.M. Stationery Office, 1927. Price 3s.)

The Committee of the Privy Council, in its Report for 1925-26, sees no grounds for anxiety in the field of pure science, but points out that there is still much to be done before our industrial position is re-established, though it emphasises the achievements of the past ten years, which are full of encouragement for the future if the efforts already made can be continued and increased.

New research associations continue to be formed, the latest being for the preserved food industry, and for the paint, colour, and varnish trades. Further grants have been made to other research associations, such as the silk, cast-iron, refractories, rubber and tyre, leather manufacturers', and other associations, but it has not been found possible to give further aid to the shale oil and sugar associations. During the financial year grants to associations totalled £88,216, the balance of the Million Fund at March 31, 1926, being £429,984, the uncommitted balance, amounting to £144,647.

The estimated net expenditure of the Department on research and administration for 1926-27 amounts to £442,877, compared with £380,263 for 1925-26 and £328,281 for 1924-25.

The Report of the Advisory Council opens with a discussion of the relations of the State and industry to scientific research. It is considered that far too many men are specialising in chemistry, whereas there is lack of those who combine chemistry with other subjects, such as agriculture, biochemistry, botany, and so on. Considering the state of industrial research, it is pointed out that industrial research must be regarded, not as a cure for, but as a prevention of, bankruptcy. The country needs a full realisation of the value of a continuous policy of research and scientific development in many important branches of industry, and of the fact that progress can be more efficiently secured by scientific methods than by the expensive process of trial and catastrophe on the large scale. More industrial research is being carried out than ever before, but far greater expansion and far greater co-ordination of effort is needed. For industries consisting of many small firms there are two means to this end: the formation of large industrial combines and the encouragement of co-operative research. It is considered that, so far as industrial research is concerned, there are great advantages in the formation of large combines, though much can be said in favour of the co-operative research associations.

The policy of the Department is to build up gradually an organisation to form a link between pure scientific research and industrial applications. It aims at accepting full responsibility for investigations of wide importance to the community which cannot be left altogether to private enterprise, and it holds to be essential that both large-scale and laboratory research should be carried out under strict scientific control and with the utmost accuracy of measurement. Thus the Department has set up organisations maintained out of public funds to meet the needs of industry in relation to forest

products, fuel, food, and building. Important as is the work of the Fuel Research Station, its success will depend, it is considered, largely on its effect in stimulating and assisting research elsewhere and by its capacity to look ahead beyond the immediate requirements of the country. The Council states it has every reason to believe that the Fuel Research Station has stimulated and assisted independent efforts. The work on food will be devoted to the prevention of waste, which is beginning to be explored systematically. Further, the Council is considering the possibility of setting up some research organisation to deal with the complex problems relating to water pollution, in co-operation with the Ministry of Health and the Ministry of Agriculture and Fisheries. The setting-up of a joint organisation with the Medical Research Council is also being contemplated, with the object of undertaking research on the production of drugs and allied problems, and also of assisting and stimulating similar research in universities and the chemical industry. At present it is impossible to get a new remedy exhaustively investigated by a competent authority, whilst development is also hindered by the comparative lack of scientific knowledge of the real action of chemical substances on the human body.

The Report then gives a valuable discussion of the state of research in these industries for which the establishment of special research organisations was not considered necessary, and, in dealing with engineering and metallurgy, it is pointed out that so extensive are the general facilities for research, that the task is rather to select the most important problems for investigation and to encourage closer co-operation with industry, than to extend substantially the existing facilities.

In dealing with the chemical industry, it is remarked that it differs from the electrical, metallurgical and engineering industries in that it has had comparatively little help from Government research, though university institutions have done much for it. The Council considers that there is no pronounced need for research in Government laboratories for the direct benefit of the chemical industry. Suggestions for assistance in important investigations that are not being adequately dealt with, would be gladly considered by the Council, but, though suggestions have been invited, none has been received. The Council has recognised the difficulty of forming research associations in the chemical industry as it was organised. Hence, it regards the recent fusion of prominent chemical manufacturing firms as an event of first-class importance from the view-point of technical progress. In command of scientific ability and natural resources and in location of markets, British chemical industry is considered to be at least as fortunate as that of any other country, and the Council hopes that to these natural advantages will now be added a determined progressive policy in research.

The Report gives a summary of the work carried out under the various research organisations of the Department, many of which have been dealt with previously in separate reports and concludes with appendices showing the composition of the research boards and committees of the department, a list of existing research associations and a review of the organisation of research in other parts of the Empire.

COMPANY NEWS

IMPERIAL CHEMICAL INDUSTRIES, LTD.

The statutory general meeting was held on March 18, the Rt. Hon. Sir Alfred Mond, Bart., P.C., M.P. (chairman), presiding. The statutory report stated that the agreement to the fusion of interests on the part of the shareholders of the participating companies had been practically unanimous. The total number of shares of the company allotted to date and credited as fully paid up in respect of the exchange value of the shares of the participating companies whose holders, up to February 22 last, had signified their agreement to the fusion was 15,470,647 7¹/₂% cumulative preference shares of £1 each, 29,915,971 ordinary shares of £1 each, and 18,256,228 deferred shares of 10s. each. Since February 22 the holders of further shares had consented, and the shares to be issued in exchange would be allotted shortly. The capital issuable in respect of shares surrendered for exchange to date represented over 95% of the total capital issuable in respect of the shares of the participating companies. The preliminary expenses were estimated at £1,270,000, as follows:—Company capital duty, £650,000; other stamp duties, £570,000; other expenses, £50,000; total, £1,270,000. Sir Alfred Mond referred to the large amount paid to the Government for stamp duty and said that before embarking on the scheme adopted, careful consideration had been given to this question, and although alternative methods of attaining their object would have saved a small proportion of the duty paid, investigations showed that by far the most efficient method was the one adopted. A large part of the capital had already borne duty once, but such was the state of the law that it had had to bear duty a second time merely because of the company's effort towards increased efficiency. This double duty was clearly a tax on efficiency. The present Government realised this when considering the position of the mining industry. They realised that one of the most fruitful sources of efficiency in that industry lay in amalgamation, and to encourage this they swept away for that industry the liability to double taxation. Surely, what was good for one industry was good for all. The chairman stated that the Committee which sat to inquire into the amendment of the Companies Act recommended the abolition of this double taxation, and he hoped that in the Bill which was shortly to be introduced in the House of Commons to implement the findings of the Committee, this subject would find its due place. If that was so, he thought that the company should have any benefit of such legislation extended to them, even in a retrospective form.

Referring to the response to the invitation to exchange into the new company, he said the exchange represented 96% of the total capital issuable in respect of the shares of the participating companies, and it was anticipated that the balance of 4% would mostly come in in a short time, as a good deal of it was held by people abroad. In a few weeks they had obtained practically a 100% merger, and he believed that such a result was unique in the history of mergers. It showed the great confidence which the shareholders in the old companies have had in the advice given to them by their Boards.

and in the Board of the new company, and it immensely facilitated the task of the new organisation in utilising the constituent powers of the merger to the very best advantage. Although the company had only been in existence relatively a few weeks, the ideas which led to the formation of the merger were proving fully justified, and alterations and changes had taken place which would increase the joint profits of the combined concerns. Already the exchange of technical information and research was proving to the benefit of the whole organisation. The fruits of some of the work being done to-day would not show immediately, but would show as time goes on, and he was confident that the step taken was the wise and right one, and was to the advantage of the industry, those engaged in the industry, and to the shareholders. As regards research the co-ordination of the work of the various laboratories and consultations between the various experts who are at the head of these laboratories, and the able technical chiefs of the various organisations were already leading to fruitful results, and in the future would lead to new developments of very considerable magnitude. It was only in this way that the industries of Great Britain could maintain themselves against the industries of the Continent or the industries of the United States. The year 1926, with a general strike and the coal dispute, was a bad year for industry, and that the balance sheets of the constituent companies showed no worse results than they did was due to the enormous inherent strength of their positions. The year 1927 opened under brighter auspices. Revival of trade was taking place, and unless some new catastrophe arose, they could look forward in 1927 to at least a normal trade. In spite of the disturbed condition of the market of China, the trading by Brunner Mond (China), Ltd., one of the subsidiaries of Imperial Chemical Industries, was, on the whole, remarkably satisfactory. It was difficult to predict exactly what would happen in 1927, but it was a curious fact that as soon as the wave of disorder and artificial agitation against British goods and British people passed, the real Chinese readily came back and took up their commercial relations with their old friends and customers.

In concluding his address, the chairman said that since the formation of the merger, there had been baseless rumours that it was the intention of the company to reduce wages, that the conditions of labour would be worse, and that the old regard for the workmen which the various firms had shown for over two generations was going to be disturbed. Such statements were entirely untrue and baseless. He had always looked upon it as a duty for the captains of industry to pay as much regard to the fair claims and needs of those who were co-operating with them in labour as any other body of people working with them. In fact, the views of the company were of an entirely opposite nature. The company intended to give close consideration to this problem in the near future. Unless there was hearty co-operation between those engaged in the ranks and those engaged at the top, and unless there was the understanding that the prosperity of industry was not merely for the benefit of the shareholder but for the benefit of the worker, there would be difficult and troublous times.

BRUNNER, MOND AND CO., LTD.

The accounts for the nine months to December 31, 1926, show a gross income, after providing £150,000 for depreciation, of £1,011,369, compared with £1,828,285 for the previous twelve months. After meeting all charges, the net profit was £856,335 (against £1,633,669), and with £150,427 brought in, makes available £1,006,762. Dividends on the preference capital absorbed £225,000 for the nine months, and the interim of 3½% on the ordinary absorbed £342,576. A final dividend has been recommended on the ordinary shares, making 7½% for the nine months, leaving £10,965 to be carried forward.

BRITISH ALUMINIUM CO.

The profit for 1926 amounted to £144,644, including the balance brought forward, and after providing for taxation, expenses in connexion with the prior lien debentures and debenture stock, placing £50,000 to depreciation reserve, £100,000 to reserve fund, and £10,000 to staff benefit fund. A final dividend has been recommended of 6% on the ordinary shares, making 10% for the year, leaving £26,567 to be carried forward.

BELL'S UNITED ASBESTOS CO., LTD.

It is proposed to pay a balance dividend of 2s. per share on the ordinary shares, making 12½% for the year (same for previous year). After placing £2000 to staff pensions account, £43,973 will be carried forward, compared with £24,962 brought in.

BRITISH ALIZARINE CO., LTD.

The report for the year ended December 31 last shows a profit of £11,899, plus £57,488 brought in, making £69,387, compared with a profit of £25,977 for 1925. The directors have written off £20,000, and recommend that the balance of £49,387 be carried forward. The directors recommend that Mr. W. H. Dawson should be appointed a director of the company. They also recommend that the number of directors should be increased to ten, and that Sir Edward A. Brotherton be elected to the Board.

SALT UNION, LTD.

The gross profits for 1926 were £323,592 (£396,034 for 1925), the net profit being £217,565, against £273,813. Dividends have been proposed of 2s. 4d. per share on the preference and 2s. 6d. per share on the ordinary shares (same), leaving £24,057 to be carried forward, after allocating £1000 to the staff fund. The report states that the quantity of salt delivered showed a considerable decline, as compared with 1925. Better business was done in some markets in 1926 than in 1925, but in others, especially in India, the effects of the coal stoppage were severely felt. Imports of foreign salt into Great Britain amounted to 62,301 tons, showing a slight decrease of 2318 tons, but this competition compelled the company to accept unremunerative prices for a considerable portion of its production.

THE NON-INFLAMMABLE FILM CO., LTD.

A circular has been issued by this company, of which Sir Herbert E. Blain, C.B.E., is chairman, and Dr. Herbert Levisstein, M.Sc., deputy-chairman, which states that at the company's works at Rickmansworth

film and acetate of cellulose have been, are being, and will be produced on commercial-sized machinery as required for the company's purposes. There was at the works sufficient full-sized film machinery to supply the first year's output under the contract with British Safety Films, Ltd., whilst the existing acetate machinery was being sufficiently increased to enable the necessary quantity to be produced. The directors, besides being engaged on the necessary extension of these works and their equipment with further machinery, were considering the desirability of several sites offered them for the purposes of the larger works which it was made quite clear in the prospectus were necessary in order to enable the total output therein mentioned to be produced. With regard to British Safety Films, Ltd., this was an entirely separate and independent company, in which Non-Inflammable Film Co. had no financial interest. The contract freed the company from setting up a selling organisation, called for the entire output of kinema film, with the exception of supplies to the Government, and was regarded as a satisfactory one by the company. They had the right to nominate a representative on the Board. The company's acetate of cellulose had been tested by three important artificial silk-manufacturing firms, who reported that it was exceedingly satisfactory for the manufacture of artificial silk, and several inquiries for bulk supplies had resulted. These could not be dealt with until additional works were ready.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LTD.

A dividend has been recommended on the ordinary shares of 4% for 1926, as against 6% for 1925.

BRITISH METAL CORPORATION, LTD.

The ordinary annual general meeting, held on March 9, was presided over by the chairman, Mr. Charles V. Sale, who commenced his remarks by expressing the regret of the company at the loss by death of Mr. F. A. Govett, a member of the board since 1924. During the year there had been a continuous increase in production and a very slow recovery in European consumption in contrast with a constantly increasing demand on the other side of the Atlantic. Comparing consumption in America in 1926 with all other countries, America used 77% of the world production of copper, 55% of tin, 11% of lead, and 44% of spelter. Owing to the strikes in England and the general depression in Germany following the stabilisation of currency, the improvement in European consumption noticed in 1925 was partially lost in 1926. The use of copper had been extended in many directions during the last few years, but the increase was only reflected in the larger consumption in America. In that country electric manufactures absorbed 40% more copper in 1926 than in 1922: motors, telegraphs and telephones 50% more, and electric light and power lines 100% more. During this period the average price of standard copper, which was £62 in 1922, rose to £66 in 1923, and fell to £63 in 1924, £62 in 1925, and £58 in 1926. The supply of tin showed little sign of expansion, prices having ranged from £260 to £320, as against £230 to £290 in 1925. [For the accounts, see CHEMISTRY AND INDUSTRY, March 11, 1927, p. 223.]

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial—Cryst., £34 per ton; **Powder,** £36 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
Bisulphite of Lime—£7 10s. per ton, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
Copper Sulphate,—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammiac.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included.
Sod. Chlorate.—2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
Arsenic, Sulphide, Yellow.—2s. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 2d. per lb.
Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
Lamp Black.—£35 per ton, barrels free.
Lead Hyposulphite.—9d. per lb.
Lithophone, 30%.—£22 10s. per ton.
Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
Sulphur Chloride.—4d. per lb., carboys extra.
Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
Vermilion, pale or deep.—5s. 3d. per lb.
Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 5s. per ton. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.
Charcoal.—£7—£10 per ton, according to grade and locality.
Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
Red Liquor.—9d.—1s. 16° Tw. per gal.
Wood Creosote.—1s. 9d. per gal., unrefined.
Wood Naphtha.—Miscible, 4s. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P.
Wood Tar.—£4—£5 10s. per ton and upwards, according to grade.
Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carboic.—Crystals, 6d. per lb. Crude 60's, 1s. 8½d.—1s. 9½d. per gal.
Acid Cresylic, 99/100.—2s. 3d.—2s. 4d. per gal. Steady. 97/99.—2s.—2s. 1d. per gal. Pale, 95%, 1s. 10d.—2s. per gal. Dark, 1s. 9d.—1s. 10d. per gal.
Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil—Strained, 8d.—8½d. per gal. Unstrained, 7½d. 8d. per gal. Both according to gravity.
Benzole.—Crude 65's, 1s. 2½d.—1s. 3½d. per gal., ex works in tank wagons; Standard motor, 1s. 9d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s. 2d.—2s. 5d. per gal., ex works in tank wagons.
Toluole.—90%, 1s. 11½d. to 2s. 3d. per gal. Firm. Pure, 2s. 3d.—2s. 5½d. per gal.
Xylol.—2s. 2d.—2s. 6d. per gal. Pure, 3s. per gal.
Creosote.—Cresylic 20/24%,—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d. 9d. per gal. Salty, 7d. per gal., less 1½%.
Naphtha.—Crude, 9d.—9½d. per gal., according to quality. Solvent 90/160, 1s. 8d.—2s. 1d. per gal. Solvent 95/160, 1s. 9d.—1s. 10d. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
Naphthalene.—Crystals, £11 10s.—£12 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
Pitch, medium soft.—85s.—100s. per ton, f.o.b. according to district. Nominal.
Pyridine.—90/140.—9s. 6d.—13s. per gal. Nominal. 90/180.—7s. 6d. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
Acid Gamma.—8s. per lb.
Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
Acid H.—3s. 3d. per lb. 100% basis d/d.
Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
Acid Neville and Winther.—4s. 9d. per lb. 100% basis. d/d.
Acid Sulphanilic.—9d. per lb. 100% basis d/d.

Aniline Oil.—7d. per lb., naked at works.
Aniline Salts.—7d. per lb., naked at works.
Anthranilic Acid.—6s. per lb. 100%.
Benzaldehyde.—2s. 3d. per lb.
Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
Benzoic Acid.—1s. 8½d. per lb.
o-Cresol 20/31° C.—4d. per lb.
m-Cresol 98/100%.—2s. 8½d. per lb.
p-Cresol 32/34° C.—2s. 8½d. per lb.
Dichloraniline.—2s. 3d. per lb.
Dimethylaniline.—2s. per lb. d/d. Drums extra.
Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
Dinitrochlorobenzene.—£84 per ton d/d.
Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
Diphenylamine.—2s. 10d. per lb. d/d.
a-Naphthol.—2s. per lb. d/d.
β-Naphthol.—11d.—1s. per lb. d/d.
a-Naphthylamine.—1s. 3d. per lb. d/d.
β-Naphthylamine.—3s. per lb. d/d.
p-Nitraniline.—1s. 9d. per lb. d/d.
m-Nitraniline.—3s. per lb. d/d.
o-Nitraniline.—5s. 9d. per lb.
Nitrobenzene.—6d. per lb., naked at works.
Nitronaphthalene.—1s. 3d. per lb. d/d.
R. Salt.—2s. 2d. per lb. 100% basis d/d.
Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
o-Toluidine.—8d. per lb., naked at works.
p-Toluidine.—2s. 2d. per lb. ex works, naked.
m-Xylidine Acetate.—2s. 6d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
Acid, Acetyl Salicylic.—2s. 5d.—2s. 6d. per lb. Firm
Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots—1s. per oz.
Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.
Acid, Camphoric.—19s.—21s. per lb.
Acid, Citric.—1s. 4d.—1s. 5d. per lb. Less 5%. Very firm, but quieter.
Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
Acid, Salicylic.—B.P. 1s. 4d.—1s. 5d. per lb. Technical 11½d.—1s. per lb.
Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
Acid, Tartaric.—1s. 1½d. per lb. Less 5%. Very firm market.
Amidol.—9s. per lb. d/d.
Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
Amidopyrin.—8s. 6d. per lb.
Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
Atropine Sulphate.—11s. per oz. for English make.
Barbitone.—6s. 6d. per lb.
Benzonaphthol.—3s. 3d. per lb.
Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—8s. 9d. per lb.
Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carriage paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 3d.—2s. 4d. per lb. Potassium.—1s. 10d.—1s. 11d. per lb. Sodium.—2s. 1d.—2d. 2d. per lb. All spot.

Calcium Lactate.—1s. 3½d.—1s. 4½d. per lb.

Chloral Hydrate.—3s. 2d.—3s. 5d. per lb., duty paid.

Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.

Cresote Carbonate.—6s. per lb.

Ether meth.—1s. 1d.—1s. 11½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—5s. per lb.

Hexamine.—2s. 4d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.).—1s. 5d. per gal. f.o.r. makers' works, naked.

Hydroquinone.—4s. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perochloride.—22s. per cwt., 112 lb. lots.

Magnesium Carbonate.—Light Commercial £33 per ton net.

Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%, in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 10s. 6d.—12s. per lb., according to quantity; Liquid (95%), 12s. per lb. Detached cryst., 14s. 6d. per lb.

Mercurials.—Red oxide, 6s. 11d.—7s. 1d. per lb., Levig. 6s. 6d.—6s. 7d. per lb.; Corrosive sublimate, Lump, 5s. 2d.—5s. 4d. per lb., Powder, 4s. 8d.—4s. 9d. per lb.; White precip., Lump, 5s. 4d.—5s. 6d. per lb., Powder, 5s. 6d.—5s. 7d. per lb., extra fine, 5s. 7d.—5s. 8d. per lb.; Calomel, 5s. 9d.—5s. 11d. per lb.; Yellow Oxide, 6s. 4d.—6s. 5d. per lb.; Persulph B.P.C., 5s. 7d.—5s. 8d. per lb.; Sulph. nig., 5s. 4d.—5s. 5d. per lb.

Methyl Salicylate.—1s. 7d. per lb.

Methyl Sulphonal.—11s. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—3s. per lb.

Phenazone.—4s. 6d. per lb.

Phenolphthalein.—6s.—6s. 3d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 94s.—100s. per cwt., less 2½% for ton lots.

Potass. Citrate.—1s. 11d.—2s. 2d. per lb.

Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins.

Resorcin.—4s. per lb. spot.

Saccharin.—55s. per lb.

Solol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyamide.—4d. per lb., carr. paid.

Sod. Hypsulphite.—Photographic, £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

S. d. Nitroprusside.—16s. per lb.

S. d. Potass. Tartrate (Rochelle Salt).—77s. 6d.—85s. per cwt. net, according to quantity.

S. d. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal 1s. 10d.—1s. 11d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per according to quantity, 1-cwt. kegs included.

Sulphonal.—7s. 6d. per lb.

Tartar Emetic B.P. cryst. or powder.—2s.—2s. 1d. per lb.

Thymol, Puriss.—11s. 3d.—11s. 9d. per lb., according quantity. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.

Aubepine (*ex Anethole*).—10s. 3d. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb.

Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.

Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.

Cinnamic Aldehyde.—Natural, 17s. 6d. per lb.

Coumarin.—10s. 9d. per lb.

Citronellol.—14s. 6d. per lb.

Citral.—9s. 6d. per lb.

Ethyl Cinnamate.—10s. per lb.

Ethyl Phthalate.—3s. per lb.

Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—19s. per lb.

Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Bois de Rose*) 16s. per lb.—(*ex Shui Oil*) 12s. per lb. Linalyl Acetate.—(*ex Bois de Rose*) 18s. per lb.—(*ex Shui Oil*) 14s. 6d. per lb.

Methyl Anthranilate.—9s. per lb.

Methyl Benzoate.—4s. 6d. per lb.

Musk Ketone.—36s. per lb.

Musk Xylol.—8s. 6d. per lb.

Nerolin.—3s. 9d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—11s. per lb.

Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 6d. per lb. Vanillin.—18s. 6d. per lb.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 1d. per lb. Bergamot.—30s. per lb. Bourbon Geranium.—11s. 3d. per lb.

Camphor.—63s. 6d. per cwt. Cananga, Java, 22s. 6d. per lb.

Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure.—6s. per lb.

Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 20s. 9d. per lb. Lemon.—11s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb.

Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 70s. per oz., Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 19s. 3d. per lb. Japanese, 8s. 6d. per lb.

Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 20s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than May 14th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Mar. 31st. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Carpenter, and South Metropolitan Gas Co. Treating gases with solids. 6852. Mar. 11.

Fraser. Grinding-mills. 6964. Mar. 12.

I.-G. Farbenind. Production of emulsions. 6999. Mar. 10. (Ger., 10.3.26.) Production of catalysts. 6965. Mar. 12. (Ger., 13.3.26.)

Leitz. Polarimeters. 6570. Mar. 9. (Ger., 31.5.26.)

Ludwig. Utilisation of heat in drying-drums. 6810. Mar. 11. (Ger., 11.3.26.)

Marks (Dorr Co.). Rotary filters. 6360. Mar. 7.
 Sharples Specialty Co. Centrifugal machines. 6708.
 Mar. 10. (U.S., 26,326.)

I.—Complete Specifications

32,235 (1925). I.-G. Farbenind. Manufacture of solutions. (245,129.)

378 (1926). Handley. Filters. (266,857.)

8968 (1926). Smallwood and Fallon. Furnaces. (266,923.)

12,593 (1926). I.-G. Farbenind. Manufacture of solutions. (252,203.)

13,141 (1926). Bendixen, and Milkovic, Ltd. Mixing apparatus. (266,950.)

15,138 (1926). Corini. See VII.

17,854 (1926). I.-G. Farbenind. Manufacture of active colloids. (255,863.)

II.—Applications

Alexander. 6375. See IX.

Allgem. Ges. f. Chem. Ind. Converting high-boiling into low-boiling hydrocarbons. 6878—80. Mar. 11. (Ger., 12.3.26, 19.6.26, and 17.9.26.)

Bamag-Meguini A.-G., and Heller. Apparatus for low-temperature distillation. 6809. Mar. 11. (Ger., 1.4.26.)

Bowen, Elvins, and Nash. Production of olefines etc. 6560. Mar. 9.

Deutsche Erdöl A.-G., and Bomeke. Gas-purifying apparatus. 6419. Mar. 8.

Dvorkovitz. Treatment of carbonaceous matter. 6453. Mar. 8.

Gruetter. Combustion with aid of catalyst. 6738. Mar. 10. (U.S., 23.8.26.)

Huessy. Fuel oils etc. 6663. Mar. 10. (Ger., 10.3.26.)

Humphrey, and Synthetic Ammonia & Nitrates, Ltd. Production of coke in briquette form. 6832. Mar. 11.

I.-G. Farbenind. Production of fine fuel dust. 6304. Mar. 7. (Ger., 8.3.26.) 6700. See VII.

Johnson (I.-G. Farbenind.). Production of hydrocarbons. 6701. Mar. 10. Production of stable suspensions of coal. 6843. Mar. 11.

Kohlenveredlung A.-G. Producing illuminating etc. gas. 6297. Mar. 7. (Ger., 9.3.26.) Gas generators. 6298. Mar. 7. (Ger., 5.3.26.)

Koks- und Halbkoks Briкетierungs Ges. Production of semi-coke briquettes. 6609. Mar. 9. (Ger., 14.10.26.)

Leon. Manufacture of activating carbons etc. 6702. Mar. 10.

Plassmann. Low-temperature distillation of fuels. 6596. Mar. 9.

Seelig. Apparatus for cracking oils. 6811 and 6818. Mar. 11. (Ger., 25.3.26 and 16.4.26.)

Soc. Internat. des Proc. Prudhomme-Houdry. Manufacture of synthetic liquid fuels. 6409. Mar. 8. (Fr., 9.3.26.)

II.—Complete Specifications

30,475 (1925). Clancy. Manufacture of hydrocarbons and cyanides. (266,809.)

30,796 (1925). Cooper, Henshaw, and Holmes & Co., Ltd. Drying of fuel gases. (266,825.)

30,973 (1925). Soc. de Recherches et d'Exploit. Petrolières. Manufacture of agglomerated adsorbent carbon. (261,692.)

3280 (1926). Internat. Combustion Eng. Corp. Treatment of coal. (249,086.)

17,403 (1926). Misch. Water-gas generator for bituminous fuel. (255,447.)

20,565 (1926). Schroder. Coke-ovens. (266,996.)

21,454 (1926). Koller. Gasification of caking coals. (257,633.)

22,991 (1926). Carpmal (I.-G. Farbenind.). See VII.

26,787 (1926). Bergedorfer Eisenwerk. Removing from fluid hydrocarbons the solid hydrocarbons precipitating at low temperature. (267,038.)

*12,461 (1926). Allgem. Ges. f. Chem. Ind. Refining mineral oils with liquid sulphur dioxide. (267,071.)

*19,860 (1926). Continentale A.-G. f. Chem. Fuel for internal-combustion engines. (267,079.)

*23,416 (1926). Geipert. Distilling small samples of coal. (267,082.)

*3036 (1927). Internat. Combustion Eng. Corp. Low-temperature distillation of coal. (267,095.)

*6086 (1927). Soc. Internat. des Proc. Prudhomme-Houdry. Hot desulphurisation of gases. (267,138.)

*6298 (1927). Kohlenveredlung A.-G. Retorts, gas-generators, and the like. (267,153.)

*6304 (1927). I.-G. Farbenind. A.-G. Production of fine fuel dust. (267,154.)

III.—Application

Graesser-Monsanto Chemical Works, Ltd., and Mather. Treatment of tar oils etc. 6383. Mar. 8.

III.—Complete Specification

*15,076 (1926). Meiro. Distillation of coal tar, tar oils, etc. (267,074.)

IV.—Applications

Carpmal (I.-G. Farbenind.). Manufacture of vat dye-stuffs. 6723. Mar. 10. Nitration of dianthrone etc. 6891. Mar. 11.

Manufacture of triphenylmethane dye-stuffs. 6892. Mar. 11.

Manufacture of dyestuffs from indoline bases 6893. Mar. 11.

I.-G. Farbenind. Production of vat dye-stuffs. 6306—7. Mar. 7. (Ger., 22.6.26, and 1.7.26.)

Production of benz-anthrone derivatives. 6308. Mar. 7. (Ger., 10.8.26.)

Imray (I.-G. Farbenind.). Manufacture of dyestuffs. 6311. Mar. 7.

Soc. Chem. Ind. in Basle. Manufacture of dyestuffs. 6448. Mar. 8. (Switz., 8.3.26.)

IV.—Complete Specifications

24,781 (1925). Carpmal (Bayer & Co.). Manufacture of azo-dyestuffs. (266,771.)

30,713 (1925). Imray (Moister, Lucius, & Brining). Manufacture of condensation products of the anthracene series. (244,120.)

7071 (1926). I.-G. Farbenind. Manufacture of dye-stuffs of the triarylmethane series. (249,160.)

8779 (1926). I.-G. Farbenind. See XX.

8918 (1926). I.-G. Farbenind. Manufacture of dyestuffs of the triarylmethane series. (250,576.)

10,957 (1926). I.-G. Farbenind. Manufacture of coeruleum sulphonic acids. (251,968.)

*5749 (1927). Comp. Nat. de Mat. Col. et Manuf. de Prod. Chim. du Nord. Manufacture of products and vat dyestuffs derived from perylene diketones. (267,121.)

*5965, 6305, and 6452 (1927). I.-G. Farbenind. See XX.

*6448 (1927). Soc. Chem. Ind. in Basle. Manufacture of dyestuffs. (267,162.)

*6449 (1927). I.-G. Farbenind. Manufacture of ortho-amino-aldehydes and ortho-amino-ketones of the anthraquinone series. (267,163.)

*6450 (1927). I.-G. Farbenind. Manufacture of ortho-amino-carboxylic acids of the anthraquinone series and substitution products thereof. (267,164.)

V.—Applications

Canadian Electro Products Co., Ltd. Cellulose derivatives. 6539. Mar. 9. (U.S., 4.5.26.)

Imray (I.-G. Farbenind.). Manufacture of coloured solutions of nitrocellulose. 6706. Mar. 10.

Peltzer & Co. Manufacture of carbon papers etc. 6455. Mar. 10. (Ger., 23.10.26.)

Robins. 6812. See XXI.

V.—Complete Specifications

27,150 (1925). British Celanese, Ltd., and Ellis. Treatment of cellulose acetate. (266,777.)

29,107 (1925). British Enka Artificial Silk Co., Ltd. Manufacture of artificial silk. (259,528.)

30,779 (1925). Rushton and Hill. Artificial silk spinning. (266,821.)

30,958 (1925). Rushton and Lever. Artificial silk spinning-machines. (266,835.)

32,988 (1925). Hatfield, and Achille Serre, Ltd. Dry cleaning. (266,850.)

9941 (1926). I.-G. Farbenind. Manufacture of a non-hygroscopic pulverulent product from sulphite cellulose waste liquor. (250,956.)

21,446 (1926). Soc. Fabr. Soie Rhodiaseta. Manufacture of artificial threads or filaments. (259,190.)

*4880 (1927). Handelmaatsch. Fibra. Producing wood pulp. (267,107.)

VI.—Application

IIöltzing. Apparatus for dyeing hanks of yarn. 6551. Mar. 9. (Ger., 19.11.26.)

VI.—Complete Specifications

2914 (1926). I.-G. Farbenind. See XV.

3378 (1926). I.-G. Farbenind. Producing fast coloured resists under aniline black. (247,211.)

VII.—Applications

Appareils et Evaporateurs Kestner. Recovery of caustic soda from residual lyes. 6711. Mar. 10. (Fr., 12.3.26.)
Eclipse Textile Devices. Dyeing. 6845. Mar. 11. (U.S., 11.3.26.) Dyeing yarn etc. 6846-7. Mar. 11. (U.S., 8.4.26.)

I.-G. Farbenind. Production of hydrogen. 6700. Mar. 10. (Ger., 10.3.26.)

Laury. Precipitating insoluble zinc compounds. 6348. Mar. 7.

Merek & Co. Iodine compositions. 6996-7. Mar. 12. (U.S., 13.3.26.)

Wagner. Producing iron oxide hydrate from iron. 6406. Mar. 8.

VII.—Complete Specifications

30,475 (1925). Clancy. See II.

15,138 (1926). Cerini. Apparatus for purifying solutions of caustic soda etc. (265,126.)

22,991 (1926). Carpmiel (I.-G. Farbenind. A.-G.). Decomposition of hydrogen sulphide and its removal from industrial gases. (267,018.)

VIII.—Application

Frink. Apparatus for melting and forming glass etc. 6826. Mar. 11.

IX.—Applications

Alexander. Manufacture of bituminous products. 6375. Mar. 7. (U.S., 4.6.26.)

Chamberlain. Protection of wood against rot etc. 6956. Mar. 12.

Curtin. Wood preservatives. 6365. Mar. 7.

Dicker (Nederlandsche Bims-Cement- en Asphaltind.). Preparing artificial asphalt. 6299. Mar. 7.

Kyber. 6477. See X.

IX.—Complete Specifications

26,252 (1925). Hills. Production of cementitious material. (266,775.)

27,582 (1925). Jakob. Production of artificial stones. (244,724.)

29,471 (1925). Jakob. Production of artificial stones. (266,789.)

30,605 (1925). Knipe. Manufacture of cement concrete. (266,814.)

11,716 (1926). Bouzin. Rotary tubular cement kilns etc. (266,939.)

19,032 (1926). I.-G. Farbenind. Manufacture of acid-proof cements. (256,258.)

23,079 (1926). I.-G. Farbenind. Manufacture of acid-proof cements. (258,616.)

X.—Applications

Boringer and Stevens. Calcining tin ores etc. 6544. Mar. 9.

Coles. Reduction of zinc oxide. 6764. Mar. 11.

Comp. des Métaux Overpelt-Lommel. Reduction of zinc ores etc. 6618. Mar. 9. (Belg., 26.1.27.) Roasting etc. fine ores etc. 6619. Mar. 9. (Belg., 26.1.27.)

I.-G. Farbenind. Decomposing titanium ores. 6842. Mar. 11. (Ger., 11.3.26.)

Jackson (Siemens & Halske A.-G.). Producing electrolytic deposits of metals etc. 6441. Mar. 8.

Jessup. Preparation of magnesium and alkaline-earth metals. 6882. Mar. 11. (Fr., 22.4.26.)

Kabushiki Kaisha Nihon Seikoshō. Manufacture of steel. 6984. Mar. 12. (Japan, 22.6.26.)

Kyber. Simultaneous manufacture of iron phosphide and fused cement. 6477. Mar. 8. (Ger., 10.3.26.)

Michelsen. Conversion of slags. 6740. Mar. 10. (Czechoslovakia, 10.3.26.)

Schantz. Recovering metal from iron pyrites etc. 6981. Mar. 12.

Smith. Treatment of platinum ores. 6704. Mar. 10.

X.—Complete Specifications

21,998 (1925). Penniman and Shackelford. Making iron chromium alloys. (244,413.)

29,855 (1925). Flodin and Gustafsson. Producing carbon-binding metal or metal alloy. (243,743.)

30,106 (1925). Tennant (Philips) Gloeilampenfabr.). Separating a mixture of hafnium and zirconium. (266,800.)

6713 (1926). Aarts. Condensation of zinc vapours. (249,123.)

15,240 (1926). Yoshikawa. Lead alloys. (253,920.)

18,845 (1926). Udylyte Process Co. Cadmium plating. (266,985.)

21,863 (1926). Dietrich. Apparatus for separating iron and slag. (267,008.)

23,969 (1926). Everitt, and Allen & Co., Ltd. Steels. (267,024.)

*20,777 (1926). Metals Protection Corp. Chromium plating. (267,080.)

*4529-30 (1927). Williams. Refining of lead bullion. (267,104-5.)

XI.—Applications

Höllingen. Production of insulating material. 6283. Mar. 7.

Jackson (Siemens & Halske A.-G.). 6441. See X.

McLachlan and Smith. Photo-electric cells. 6979. Mar. 9.

Neale. Light-sensitive cells. 6259. Mar. 7.

XI.—Complete Specifications

27,051 (1925). Lübeck. Electric accumulators. (242,290.)

30,248 (1925). Lawaczek. Electrolytic decomposing cells. (266,803.)

45 (1926). Burgess Battery Co. Dry batteries. (245,464.)

18,045 (1926). Carpmiel (I.-G. Farbenind.). Apparatus for treating gases and vapours with silent electric discharges. (266,983.)

XII.—Application

Maschinenfabrik Elite A.-G. Manufacture of soap flakes. 6598. Mar. 9. (Ger., 29.3.26.)

XII.—Complete Specifications

29,798 (1925). Colloidal Products Co. Making soaps and detergents. (243,735.)

*2191 (1927). Krupp Grusonwerk A.-G. Treatment of oil-containing fruits. (267,092.)

XIII.—Application

Turner. Paints or protecting compositions. 6381. Mar. 7.

XIV.—Application

Dunlop Rubber Co., Ltd., Murphy, and Twiss. Manufacture of rubber etc. 6088. Mar. 10.

XV.—Applications

Andrew, and Betjemann & Sons. Treatment of fish skins. 6330. Mar. 7.

Simpson. Manufacture of imitation leather etc. 6935. Mar. 12.

XV.—Complete Specifications

2914 (1926). I.-G. Farbenind. Dyeing leather with acid azo-dyestuffs. (247,187.)

27,742 (1926). Ehrenreich. Manufacture of glues, gelatins, etc. (267,041.)

XVI.—Applications

Boehringer und Soehne. Manure. 6749. Mar. 10. (Ger., 3.4.26.)

Wade (Mason). Treating agricultural crops. 6614. Mar. 9. Drying agricultural produce. 6615. Mar. 9.

XVI.—Complete Specification

1778 (1926). Crusius. Transforming organic refuse. (246,484.)

XVI.—Application

Capps. Treating sugar-beet juices. 6519. Mar. 9.

XIX.—Applications

Agelasto and others (Searamanga). Preserving milk. 6875. Mar. 11.

Greville. Treatment of cereals. 6922. Mar. 12

Jones. Animal etc. foods. 6632. Mar. 10.

Matzka. Preserving fruit juices etc. 6290. Mar. 7.

U.S. Farm Feed Corp. Manufacture of livestock food. 6288. Mar. 7. (U.S., 11.6.26.)

XIX.—Complete Specifications

5857 (1926). Owe. Production of vitamin preparations. (266,905.)

13,399 (1926). O'Callaghan. Improvement of creams and production of butter. (266,951.)

26,325 (1926). Patrouilleau. Treating miller's wheat. (260,283.)

XX.—Applications

Bowen, Elvins, and Nash. 6560. See II.

Canadian Electro Products Co., Ltd. Manufacture of benzoic acid esters. 6540. Mar. 9. (U.S., 4.5.26.)

Chem. Fabr. vorm. Schering. Manufacture of alkaloid salts of camphoric acid. 6722. Mar. 10. (Ger., 15.4.26.)

I.-G. Farbenind. Production of organic compounds. 6305. Mar. 7. (Ger., 8.3.26.) Manufacture of ortho-amino-aldehydes etc. Mar. 8. 6449. (Ger., 8.3.26.)

Manufacture of ortho-amino-carboxylic acids etc. 6450. Mar. 8. (Ger., 8.3.26.) Manufacture of organic compounds. 6452. Mar. 8. (Ger., 8.3.26.)

Parke, Davis & Co. Measles toxin and anti-toxin. 6494. Mar. 8. (U.S., 15.3.26.)

Pollak. Manufacture of condensation products. 6970. Mar. 12.

XX.—Complete Specifications

30,759 (1925). Stickings, and May & Baker, Ltd. Manufacture of basic bismuth salts of aryl-arsinic acids. (266,820.)

30,791 (1925). Carpmael (Chem. Fabr. vorm. Schering). Manufacture of organic metallic mercapto-sulphonic acids and salts. (266,824.)

8779 (1926). I.-G. Farbenind. Manufacture of ortho-aminophenyl-propionic acid, its substitution products or homologues. (250,250.)

11,732 (1926). Carpmael (I.-G. Farbenind.). Manufacture of acid sulphuric acid esters of oxy-alkyl compounds of the aromatic series. (266,940.)

*5965 (1927). I.-G. Farbenind. Manufacture of side-chain aromatic compounds or their sulphonic acids. (267,132.)

*6305 (1927). I.-G. Farbenind. Manufacture of organic compounds. (267,155.)

*6452 (1927). I.-G. Farbenind. Manufacture and production of organic compounds. (267,165.)

XXI.—Applications

Howard and Robertson. Photographic films. 6581. Mar. 9. Robins. Non-inflammable films. 6812. Mar. 11.

XXI.—Complete Specification

7403 (1926). Schweitzer. Obtaining photographic points in colours. (249,530.)

XXII.—Application

Luis. Explosives. 6575. Mar. 9.

XXIII.—Applications

Lawrence, Thomson, and United Water Softeners, Ltd. Apparatus for purifying water etc. 6898. Mar. 11.

Quick. Filter beds. 6833. Mar. 11.

XXIII.—Complete Specifications

1795 (1926). I.-G. Farbenind. Insecticidal and like powders. (250,180.)

4446 (1926). Lovett. Treatment of sewage. (266,893.)

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Egypt*: Linoleum, soap, boot and furniture polish (276); Photostat paper and chemicals (B.X. 3341). *Northern Ireland*: Bakers' sundries (247). *Poland*: Tyres (273).

EDITORIAL

The Chemical Society's Dinner

DURING the winter, now over, and the spring, now welcoming the few dragged stocks and other tender herbs which have lived through the winter, the chemists cultivate the dining habit. Formerly this was a mystery to us; we wondered why the analysts, the biochemists, the colour chemists, the dyers, the engineers, the fuel technologists, and so on right through the alphabet, assembled and met together so that a collector of such occasions could enumerate from forty to sixty in a season. It puzzled us, and we were no more able to solve the problem than the ingenious lady who could not make out whether the London fogs produced the serious people or the serious people produced the fogs. We have ceased to investigate the cause; the fact is that in the old days the wife was glad to have her husband at home; now she is thankful if, once a week, the husband will take her out to a banquet. Any excuse will do, a poor one is better than none; this year centenaries are fashionable, Beethoven, Berthelot, and Newton will do for the spring, and others are preparing later. Next year the dinners are to be grouped in industries, and in 1929 there is to be a gathering of the unvaccinated chemists in March, the bridge-playing chemists in May, and the froth-blowers in October. At the Chemical Society's dinner we had few speeches, and those good. Lord Sumner had just that degree of playfulness which is appropriate to an after-dinner speech; he seemed to be always on the verge of experimenting on the tensile strength of the lower extremities of his listeners; nothing that we remember of his speech was either meaningless or solemn; they say grey heads have green thoughts; we were able to enjoy the freshness of many ideas which,

on this occasion, were imprisoned neither by the wig nor the coronet. Prof. Matignon spoke of the audacity of the British men of science, contrasting this with the caution, even the timidity, of the French men of science. We wonder whether this will bear investigation; our knowledge of French science is meagre in the extreme, and we should like to have some convincing proof of the timidity of Lavoisier, of Pascal, of Buffon, Cuvier, Pasteur, Laplace, and a few others whose names are honoured here, though their works are remembered only by the learned. Prof. Matignon and Prof. Schlenk both spoke of the international character of science; chemistry is particularly international in its history, in its industrial ramifications, and in its hospitality. We think that all were glad to welcome the distinguished German and French chemists who honoured us by coming so far to make our acquaintance and each other's. Prof. Schlenk spoke good English, and has evidently had many opportunities of cultivating his acquaintance with our language. We regret that he is known to so few of us personally; twelve years is a wide gap in chemistry; we hope that there will be no more such gaps.

Motives

We have been considerably impressed by a letter from Prof. Hilditch, which we hasten to print in this issue. Despite our modesty, we could not refrain from a certain glow when we noted the kindness of Prof. Hilditch's reference to our editorial remarks, but we were not a little puzzled in trying to retrace the analytical process by which he was led to classify our composition as a Sonatina. We have re-read our note, and, though we can discern traces of structure, we should hesitate to define its form so boldly as does Prof. Hilditch.

It is, we might have ventured, composed in the binary form, but, according to the traditional view, it might be classed as a ternary movement, since it complies with rule in ending on a full close in the tonic key. Some modern critics might find evidence of cyclic structure, though we meant it but as a divertimento, as a faint shadow of a great occasion, and did not assign to it even a suitable key signature or even a tempo. To many, the word sonatina will recall hours of fruitless drudgery devoted to the unwilling attempt to correlate muscular action and nerve control, but the qualifying adjective which our correspondent uses prevents us from suspecting a comparison with the dull Clementi, and suggests an antique character, not devoid of nobility, implying an attitude which we shall attempt to maintain with even greater assiduity. We are still more pleased, for we recollect that Beethoven himself wrote sonatinas which are of more substantial structure than one or two other compositions which he styled under the more important name of sonata. Be the form as you will, we are glad that Prof. Hilditch has been moved by our effusion to set down such charming thoughts, though we fail to see how he could justify his claim that we intruded the "jarring notes of self-interest and the mercenary motive." Our harmonies may not have been all resolved, but we cannot trace any discord in our remarks. As we observed, we believe that it is unprofitable for any professional worker to confine himself strictly within the bounds of his profession, but we did not mean to imply that the profit was of that kind which is reflected in the increasing cordiality of the bank manager. Such a profit is reflected in an increased fullness, a greater richness of life, a gain in the art of living, and it follows that the scientific worker who is possessed of at least some interest in the things which interest his fellow men will be all the better a worker for it. Be it far from us to think that culture should be acquired for any mercenary motive; the insincerity of such a procedure would defeat its own purpose, and the end would be worse than the first state. We once knew a brilliant investigator—he was not a chemist, and chemists are not alone in having to face a rapidly rising flood of literature—who was warned that he was becoming narrow in his outlook. The remedy he discovered was to read poetry on Wednesday evenings from 7.15 to 9.15 sharp, and the classics on Saturdays from 8 to 10. The end was painful, and we will not relate it. Culture, whether it be a love of Beethoven or Piers Plowman, a passion for Stravinsky or Anatole France, or an enthusiasm for the Flemish primitives, can only be acquired for its own sake. We are not anxious for scientific workers to debate the merits of the Hallé orchestra compared with the Savoy bands; we do not mind if they have decided preferences for or antipathies against Honegger or Scarlatti, but, watching the fast rising tide of scientific output, we do feel the danger that, in the effort of "keeping up," the scientific worker may lose sight of the firm shore of humanity. On such an occasion as the recent celebration it is right to consider its implications and to remind ourselves of the wide world that lies outside our profession of chemistry, vast and important as it is. So may we profit, and that without mercenary motive.

METALLURGICAL SPECTRUM ANALYSIS*

By F. TWYMAN, F.R.S.

PART I.—QUALITATIVE SPECTRUM ANALYSIS

Development up to 1861

Newton's discovery of the dispersion of light, published in 1672, may be called the first step towards spectrum analysis. But if we except that first step, the development commenced in 1800 with the discovery by W. Herschel that all parts of the spectrum have power to heat bodies, and that this power is assisted by an invisible extension of the spectrum beyond the red end. This discovery paved the way for that of Ritter, published in the next year, that the power of light to blacken silver chloride is possessed also by an invisible extension of the spectrum beyond the violet end.

Wollaston in 1802 first observed regions in the sun's spectrum, presenting the appearance of dark bands and lines, where the spectrum was less intense than at others. Wollaston also observed a discontinuous emission spectrum for the first time.

The year 1817 is made notable by the publication of several important discoveries of the great instrument maker Fraunhofer.

The description of the first spectroscope, and of its use for the observation of metallic emission lines (the yellow doublet of sodium); accounts of the first measurements of the lines of the solar spectrum and of the first observation of the spectrum of the stars, of measurements of refractive indices of various glasses for the principal lines of the solar spectrum and of observations of the spectrum of the electric spark, were all published by him in that same year.

In 1821 was first published Fraunhofer's invention of the diffraction grating as a means of producing spectra and the measurements made therewith of the position in the solar spectrum of the dark lines, thereafter called Fraunhofer lines.

In 1823 J. F. W. Herschel published the first systematic observations of metallic emission spectra with an attempt to record their positions graphically.

In 1832 Brewster published experiments leading to the conclusion that the original light from the sun forms a continuous spectrum, and that the dark Fraunhofer lines are due to the vapours surrounding the sun, though it is very doubtful whether Brewster himself at that time apprehended any such conclusion with clearness.

In 1835 W. H. F. Talbot published a clear statement of the spectrum analysis of lithium and strontium. Talbot's words are distinguished by great clearness, and I therefore quote them:—"The strontium flame exhibits a great number of red rays well separated from each other by dark intervals, not to mention an orange, and a very definite bright blue one. The lithium exhibits one single red ray. Hence I hesitate not to say that optical analysis can distinguish the minutest portions of these two substances from each other with as much certainty if not more, than any other known method."

* Read before the Birmingham and Midland Section on February 23

In 1842 Becquerel and Draper independently obtained on a daguerrotype plate the first photographs of a spectrum, in both cases the solar spectrum.

In 1855, Angstrom first clearly showed that the spectrum of a spark discharge between metallic electrodes is distinctive of the metal. He published drawings of the spark spectra of many metals and of some alloys.

The publication by Kirchhoff and Bunsen in 1861 of their discovery that the vapour of a metal produces absorption lines identical in position with the emission lines of its flame spectrum, and their accompanying description of their spectrometer, and of the first use in that spectrometer of a collimator, brought spectrum analysis to a point beyond which it was not to develop to any considerable extent for many years.

Arrested Development

Kirchhoff and Bunsen used spectrum analysis (the name which they gave to this new technique) in the daily work of their laboratory. The method won many brilliant successes, among them the discovery of numerous new elements. Yet it was to be nearly 50 years before it began at all widely to fulfil the original

which are of industrial interest, even when they are present in a metal or alloy in small quantities, are not then always easily detected by the examination of their visible spectrum.

The Development of Analysis by Spectrography

The illustration (Fig. 1) shows, by means of photographs taken with a quartz spectrograph, what a valuable region of the spectrum is excluded if one has a visual instrument only. Wave-length 4023 represents the extreme of the visible spectrum, the region from 3800 to 1854 being invisible.

It is easy to understand then how it is that the vigorous resuscitation of spectrum analysis which has commenced in the last few years has been associated with the use of the quartz spectrograph; and this, notwithstanding that the most useful instrument for the general inorganic chemist to have at his elbow, after the balance, is a good visual spectrometer.

The revival of spectrum analysis is to be referred chiefly to the work of W. N. Hartley with his co-workers, and to A. de Gramont. Hartley, using the spark spectra of solutions of metals, first noted that it is not always

FIG. 1

expectation that it would find use as a general method of qualitative analysis, although there were never wanting a few chemists who constantly referred to the spectroscope in their daily work.

The time is too short for me to give an account of the numerous reasons which have been put forward to explain this hiatus; it suffices to remind you that the important developments of spectroscopy and the spectroscope which took place in those years were mainly under the auspices of the physicists and the astronomers, for whom it rapidly became an instrument of supreme importance.

Those chemists (they are still greatly in the minority) who use the spectroscope, use it very often, and find it almost indispensable. As a means of detecting minute quantities of the metals it is unrivalled. A metal can be readily distinguished in the presence of any other element, compound, or mixture without the necessity of separation. The qualitative analysis of the metallic constituents of a substance, which the spectroscope gives so easily, is a sure basis for planning a chemical analysis. As the determination of each element proceeds the purity of precipitates may be checked as often as desired.

If the spectroscope has been neglected in general chemistry, it is not surprising that it was neglected in metallurgical chemistry; for many of the impurities

the strongest lines of the metal which are the most persistent when that element is present in a substance in small and decreasing amounts. Already in 1882, he had investigated the proportions of certain metals which would be evidenced in compounds by the presence of their lines in the spectrum, and had, as a result, estimated the amount of beryllium contained in certain cerium compounds.

Hartley's work was continued, also at Dublin, by Pollok and Leonard, and this group of workers studied the metals named in the next two tables, numbers 2 and 3. Pollok and Leonard, also using the spark spectra of solutions, distinguished the lines of each particular metal by Greek letters, which show the persistence of the spectrum line as the quantity of metal present was reduced (see Tables 1 and 2).

TABLE I

(Pollok's nomenclature for the sensitive spectrum lines of metals in solution as photographed on a Hilger quartz spectrograph.)

To distinguish briefly between the different phases of the lines, with diminishing concentration, use has been made of some of the letters of the Greek alphabet, with the following meanings:

- τ = seen with the metal, but not with strong solutions.
- σ = seen with strong solutions, but not with 1% solutions.
- ϕ = seen with 1% solutions, but not with 0.1% solutions.
- χ = seen with 0.1% solutions, but not with 0.01% solutions.
- ψ = seen with 0.01% solutions, but not with 0.001% solutions.
- ω = seen with 0.001% solutions.

FIG. 2

TABLE II
Quantitative spectrum of cobalt chloride

Wavelength	Intensity and Persistence	Wavelength	Intensity and Persistence
4531.1	4σ	3412.8	7φ
4409.7	1σ	3405.3	8φ
4121.5	8φ	3086.0	6φ
4118.9	8σ	3072.5	0φ
3995.5	8φ	2694.7	8ω
3804.2	10φ	2603.6	8χ
3873.2	10φ	2587.2	8φ
3845.6	10φ	2582.1	8χ
3602.4	8χ	2580.4	8φ
3180.5	10φ	2564.2	8φ
3474.1	10χ	2559.5	8χ
3465.0	8φ	2528.7	7χ
3453.6	8φ	2525.1	7χ
3449.0	7φ	2519.0	8ω
3443.8	7φ		
3433.2	7φ		

In this way Hartley and his co-workers laid the basis of an approximate quantitative spectrum analysis, and although it is only in rare cases that this method can compare with the balance it provides a means of readily distinguishing between a considerable percentage of a material and mere traces only, which is often very valuable. More important still, it is now unnecessary in hunting for a small quantity of a substance in a sample to look for any but the few lines known to be persistent.

A. de Gramont, working on the spark spectra of solids, found that the persistent lines (which he called "Raies

sensibles"):—1. Were not always the strongest lines in the spectrum of the pure metal. 2. Are present in the spark, but belong to the arc spectrum of the element, where they are generally of great intensity. 3. Are generally present also in the spectra of very hot flames (oxyhydrogen or oxyacetylene).

A number of de Gramont's lines are shown in Fig. 1.

A. de Gramont found that these conclusions hold for alloys, minerals, and fused salts, and states that his observations are in general agreement with those of Pollok and Leonard in the case of solutions, which greatly increases the value of the tables of all these observers.

The order of sensibility is that found by photography, either with a quartz or with a uviol crown glass spectrograph, and it is in the ultra-violet that the "Raies Ultimes" almost always lie. But where "Raies sensibles" are recorded in the visible spectrum they are often of high sensibility for the eye.

Modern Spectrographs, and Ways of Using Them

The instruments with which Hartley and de Gramont first worked, although quartz spectrographs, were not of the modern convenient kind. As the work done by de Gramont, Hartley, Pollok and Leonard was published, it became obvious that for general use a convenient photographic instrument was needed, and in 1909 I designed the fixed adjustment quartz spectrograph

(Fig. 2) which, with slight modifications, is that in general use at the present time. In 1912, in order to deal more readily with the very complex spectra of modern steels, a still larger size quartz spectrograph was made, giving three times the dispersion of the former one.

Now let me say a few words concerning the process of taking a spectrogram.

LIGHT SOURCE

There are four main ways of producing from a substance radiation suitable for its spectroscopic analysis: by the flame, the arc discharge, the spark discharge, and the vacuum tube discharge.

In the flame it is only certain metals which emit radiations capable of analytical interpretation. In the arc all the metals and in addition the five non-metals, carbon, silicon, boron, phosphorus and arsenic, reveal their presence by characteristic spectra. In the spark many of the non-metals, among them fluorine, chlorine, bromine, iodine, oxygen, nitrogen, sulphur and selenium, become detectable as well as the metals, and the method is applicable to solutions as well as solids, which is not

(b) A spectroscope of low dispersion and high luminosity is the best.

(c) The ultra-violet spectrum in flame spectra being too weak to have any value for analysis, a visual spectroscope is all that is required.

(d) Although in the case of sodium the phenomenon lasts a considerable time, yet in other cases such as those of potassium and rubidium it is very evanescent, and the observation should therefore be made at the instant of introducing the salt into the flame.

Arc Spectra.—Arc spectra are, I think, the most generally useful, and when electric supply at from 150 to 220 volts D.C. is available the production of the arc between metal electrodes is very simple.

When the voltage available is less than this, or when A.C. only is available most metallic arcs will not run; but the difficulty may be avoided by using carbon electrodes, and putting the substance to be examined on the lower pole.

A simple hand feed holder is connected to the supply through a resistance, a current of from 3 to 6 amperes being used. Electrodes, as pure as possible, of carbon,

FIG. 3

the case with the arc.* With the spark, "air lines"† are usually in evidence, but these can be removed by the use of a self-induction coil.

Under ordinary conditions in the vacuum tube the substance of the electrodes gives no spectrum, the lines present being only those of the rarefied gas in which the discharge takes place.

The wavelengths of the spectrum of a metal are not affected either by its state of chemical combination, or by the presence of other metals.

Flame Spectra.—Every chemist is familiar with the production of flame spectra. They are obtainable from certain metals or their salts when these are put into a Bunsen flame.

Innumerable variants of this device are to be found in the mass of literature which has accumulated since the time of Bunsen, who originated this method in 1859, but it suffices to state here that as far as analytical purposes are concerned:

(a) Flame spectra are of value only in identifying the alkali and alkaline earth metals with the addition of indium and thallium.

* The last-named eight elements do not, however, give their spectra under such conditions as to render their spectroscopic detection in a substance generally feasible.

† i.e., lines of oxygen and nitrogen.

copper or iron, or of the metal to be examined, are held in the holder, and the arc is struck by allowing the electrodes to touch and then separating them by two or three millimetres. The following procedures suffice for practically all cases likely to arise.

Metallic Specimens.—Where the specimen is in the form of metallic rods or metallic pieces large enough, these can themselves be used as electrodes.

Small metallic or other specimens, powders, precipitates, dry resinsates from solutions, etc.—Specially pure carbon electrodes are used, and a small cup is scooped out in the lower carbon. Into this the specimen is dropped and the arc struck. A variant of this procedure is to use copper electrodes, a few milligrams of the substance being placed on the lower copper pole when the latter is hot. The substance adheres to the pole, and the spectrum of its metallic components is observable for some time.

Spark spectra.—The apparatus required for producing the spark consists of an induction coil, or preferably, a $\frac{1}{4}$ -kw. transformer giving 15,000 volts on open circuit, with a condenser and self-induction coil. If alternating current is not available, a small converter must be added. These are arranged as in Fig. 3.

(To be continued)

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

ANNUAL REPORTS OF THE PROGRESS OF APPLIED CHEMISTRY—VOL. XI.

This volume of the Annual Reports (covering the year 1926) is now ready, and copies have been despatched to those who have subscribed for them.

The price of the volume is 7s. 6d. to members of the Society and 12s. 6d. to non-members. Fellows of the Chemical Society, who are not members of the Society of Chemical Industry, can purchase the book at the price of 10s.

Orders for copies, accompanied by the appropriate remittance, should be sent to the General Secretary of the Society.

DEATHS

Dodds, James M. (elected 1917), of 6, Clare Road, Cotham, Bristol. Works Manager. On March 1, 1927.

Stewart, Robert (elected 1890), of 46, Westbourne Road, Luton. Director of Messrs. B. Laporte, Ltd. On March 21, 1927.

AMERICAN SECTION

The meeting on February 11, in Rumford Hall of the Chemists' Club, was a joint meeting with the New York Section of the American Electrochemical Society and the American Section of the Société de Chimie Industrielle. Dr. Allen Rogers was in the chair.

Prof. Edward Bartow, of the University of Iowa, who spoke on the subject of "Sewage and trade wastes," described the activated sludge process, and illustrated his remarks with slides of various large-scale sewage-disposal plants. He then spoke of the treatment of waste from corn products plants, and summarised the tremendous reductions made in the population equivalent of the waste by more careful manufacturing operations. The paper will be published in full at a later date.

Following the remarks of Prof. Bartow, Prof. D. D. Jackson discussed the methods of treatment used by New York City of distribution in the surrounding water. This capacity is largely taken up at the present time, so that in the not distant future other means must be used.

Mr. E. B. Besscheyre described a proposed activated-sludge plant for New York City, and outlined the legislation regarding sewage and trade waste in other States. Mr. William R. Copeland followed with a discussion of conditions in Connecticut and the problems involved by State lines. Discussion by members and guests followed.

Seventy-five members and guests attended the dinner which preceded the meeting, and about 150 attended the meeting.

BIRMINGHAM SECTION

Mr. D. W. Parkes, B.A., B.Sc., read a paper at the meeting on March 22, his subject being "The removal and recovery of phenols from ammonia sulphate still effluents."

The author observed that the besetting problems of the production of sulphate of ammonia are the removal of the tar acids from the liquor, and the second the

recovery of the tar acids removed. The problem of the removal of the tar acids appeals chiefly to those responsible for the cleanliness of streams and rivers and for the proper working of sewage disposal plants; whilst recovery of the tar acids appeals more to the ammonia distillers, who, in due course, will probably be compelled by law to carry out some form of purification, and who hope, by recovering the phenols removed, to defray at least part of the cost of purification. Experimental work had been done on a process which aimed solely at the removal of the noxious constituents of waste liquor. Briefly, the process consisted in running the liquor down scrubbing towers up which hot fire gases are blown with a steam injector. While considerable improvement was obtained by this treatment, the results were not considered entirely satisfactory, and an attempt was made further to purify the liquor by bacterial action. The dephenolating towers reduced the phenols by 71% and the oxygen absorption figure by 42%, but did not affect the thiocyanate in the liquor. Hitherto most processes which had aimed at the recovery of the phenols had been based on the principle of washing the liquor with benzol or other solvent, and subsequent extraction of the solvent with strong soda. Another interesting proposal had been put forward—to wash the crude ammonia liquor before distillation.

In this process the waste liquor is first saturated with carbon dioxide, whereby a considerable amount of sludge is precipitated and allowed to settle out. The settled liquor is then brought into contact with activated carbon, whereby the whole or any desired proportion of the phenols is removed. At the same time there is a considerable reduction in the thiocyanate content and a drop in the oxygen absorption figure. When the carbon is saturated with phenols, it is freed as far as possible from adhering liquor, and distilled in a current of superheated steam, whereby 80% of the tar acids adsorbed can be recovered, chiefly in the form of liquid tar acids and a saturated aqueous solution. The carbon is then ready for the treatment of a further quantity of liquor. The speaker then dealt briefly with the various parts of the investigation which led to their present method of procedure.

Opening the discussion, the Chairman (Mr. Mann) emphasised the importance of the subject, and said unless something were done at an early date to cope with the trouble, some of the industries would either have to incur a very large expense or shut up altogether. He believed Mr. Parkes had struck the right line. It would appear that the chief heads he had to work upon were to account for the decomposition of phenols in the early stages where he used carbon for the first time, and to obtain a suitable carbon. That was most difficult to obtain. Brilliant promises of what the carbon would do were not realised in performance.

Dr. A. Parker said the gas industry viewed the subject with such concern that it had in operation at the present time a Gas Effluents Research Committee, working on the treatment and disposal of sulphate effluents. The programme before them was very big, and the paper had touched on one possible way of dealing with gas effluents. There were many other possible ways. The first item of importance was that of cost. Was the process likely

to be profitable, assuming there was a supply of really good active carbon. The difficulty of obtaining carbon was by no means a new one. He wondered whether Mr. Parkes could elaborate the point with regard to the decomposition of phenols in the early stages, because the same thing occurred with benzol.

Dr. E. W. Smith congratulated Mr. Parkes upon a really valuable contribution to the subject. To Mr. Parkes the gas industry must give its thanks; and more particularly to the progressive policy of Messrs. Robinson Brothers for allowing him to publish material which many might consider premature to make known. The effluent was an essential and necessary evil in the gas industry working, and there would come a time when it would have to be treated compulsorily; therefore, too much could be made of the question of cost. It was not necessary, he meant, to show a profit. A further point which arose was whether the charge for dealing with the effluent was one that should be borne by the industry itself. Gas undertakings were large ratepayers, and for the rates paid they had a right to claim consideration from the disposal methods that were adopted for domestic effluents. Another point which gas undertakings must consider was that effluent difficulties could be very largely reduced by not making as big a proportion of the oxygen absorbing bodies as were being made, unnecessarily, in the liquor products of a gas undertaking.

Mr. F. R. O'Shaughnessy said, with regard to the question of costs, that the increased cost of the treatment of sewage, receiving over 1% of this waste liquor, must be taken into consideration. When they got over 1% of the liquor in sewage, the cost of treatment went up by leaps and bounds.

Mr. Rowell pointed out that buying activated carbon was obviously costly, and the products were not too valuable.

Replying on the discussion, Mr. Parkes said he could not give any figures as to cost. They had regarded the matter from the standpoint that some process would have to be used. They knew beforehand that phenols were being removed from the liquor at a considerable loss, therefore they worked on a different process which seemed fairly hopeful. He could not give any information about the decomposition of phenol; there was no doubt it did decompose. With regard to the washing recovery processes, he believed they were in operation in some places on the Continent, but from the figures supplied he could never see how they worked out their profit. As to the determination of phenols, they could not use the distillation method. Regarding a suggestion that they might treat phenol liquors with formalin with a view to the production of synthetic resin, the trouble was that formalin and phenol in weak solutions would not combine.

CHEMICAL ENGINEERING GROUP

A joint meeting of the Institution of Mechanical Engineers and the Chemical Engineering Group of the Society of Chemical Industry took place on March 25 in the lecture theatre of the Institution, when, under the chairmanship of Sir Henry Fowler, President of the Mechanical Engineers, Dr. Ormandy read a paper on "Lubrication." Such was the interest shown in this

subject that standing room only was available for late comers.

Lubrication being a problem of liquid and solid interfaces, the author first considered the case of polar and non-polar molecules in contact with surfaces, and then gave a brief résumé of the method and experiments by which Langmuir has been able to calculate the cross-section and estimate the length of the molecule. After considering how the arrangement of the carbon atoms in the long chain compounds had a direct bearing on the problem of lubrication, Dr. Ormandy next dealt with the surface energy of solids, and showed that all solid surfaces have sufficient free energy to enable them to absorb liquids or gases, and that liquids such as oils having a low surface tension will wet these surfaces more readily than liquids possessing a high surface tension. Spreading of fatty acids etc. on clean metallic surfaces would only take place if the surface has been previously wetted. On the physical side it was shown that Hardy and his collaborators had found that the coefficient of friction between surfaces which had been wetted with thin layers of non-polar bodies immediately attained a minimum value, whereas if the surfaces were wetted with polar bodies appreciable time must elapse before this minimum was reached. With composite bodies such as mixtures of non-polar and polar oils a definite time must elapse before this minimum was arrived at, but the lag would be of much shorter duration than for the polar oil alone. This coefficient of friction between plane faces also diminishes with increase of pressure between the surfaces up to a point, after which it becomes independent of the load. The author also described experiments relating to the movements of discs and spheres through liquids, and discussed the relative importance of such factors as viscosity, flash point, volatility, and resistance to oxidation of lubricating oils. It was clearly demonstrated in the paper that the problem of lubrication is not merely a question of pressure, time and viscosity, but embodied many chemical and physical properties of the metals as well as the liquids employed.

An interesting discussion followed, in which the problem of lubrication was considered from the physical, chemical and engineering aspects, and it was suggested that the time was ripe for further united research by the chemist, physicist, and engineer and producer into this very important problem. Amongst those who took part in the discussion were Sir William Hardy, Drs. Haig, Hele-Shaw, and Watson, and Messrs. J. E. Southcombe and A. G. Marshall.

LIVERPOOL SECTION

The annual meeting of the Section was held on March 16 in the Muspratt Lecture Theatre, the University, Prof. W. H. Roberts in the Chair. The following elections were made for the session 1927-28:—Chairman, Dr. Alfred Holt; Vice-Chairman, Assoc. Prof. W. H. Roberts; Hon. Treasurer, Dr. Alfred Holt; Hon. Secretary, E. Gabriel Jones; Representative on Chemical Engineering Group, Mr. W. Ramsay Sibbald. Dr. A. C. Cumming, Mr. Edwin Thompson, Dr. E. L. Peck, and Mr. J. L. F. Vogel were elected to fill the vacant seats on the Committee.

In the secretary's report for the session, which was read and adopted, it was stated that there was a slight decrease in membership compared with last year, and an appeal was made for members to obtain new recruits. The number of associate members had decreased, and it was hoped that new ones would be enrolled. With regret, the deaths of five members were recorded: Messrs. J. M. Gibson, J. W. Kynaston (both original members of the Society), Roscoe Brunner, J. L. Lee, and A. T. Smith. Up to last month five meetings had been held, the average attendance being 50. Joint meetings were held with the Fuel Section and with the Manchester Section. The number of Liverpool members who attended the joint meeting with Manchester was disappointingly small, and it was hoped that members would not cease to support these inter-section meetings, which afforded excellent opportunities of keeping in touch with their Manchester friends to mutual advantage. In conclusion, the hon. secretary recorded his indebtedness to the chairman for his assistance and advice in connexion with his secretarial duties, and said all regretted that illness had prevented the chairman from attending some of the meetings. The Section was extremely glad he was able to preside at that meeting, the last of the session.

The chairman invited suggestions or criticism and appealed to the Section to endeavour to obtain new members.

The business meeting was followed by a joint meeting with the Liverpool and North Western Section of the Institute of Chemistry, and an address was delivered by Prof. J. C. Drummond, D.Sc., F.I.C., entitled "Biochemical aspects of the nature of life."

The differentiation between life and death, or between systems which may be regarded as living or non-living, said Prof. Drummond, has occupied the minds of philosophers from the early days of human thought. The consideration of animism founded by the great philosophers survived after the Middle Ages, and took definite shape as far as chemists were concerned in the vitalistic theories flourishing in the early part of last century. These theories were rudely shaken by the discovery of Wöhler, and have ever since lost ground. The evolution of the inorganic world stands revealed by the researches of chemists and astro-physicists. The researches of Moore and Baly have taught us something of the transition from the inorganic to the organic. At the other extreme there stretch the extensive ramifications of the evolutionary paths of plants and animals. Between lies that unexplored region which holds the secret of the transition from the living to the non-living. Some glimpses of this area are being obtained by studies of remarkable organisms, such as the ultra-microscopic viruses, and the bacteriophages of d'Herelle.

The phenomena of life may, for purposes of our argument, be taken as growth, assimilation, respiration, reproduction and movement, all of which represent complex energy exchanges, the ebb and flow of which differentiates, at any rate recognised, forms of life from inert systems. The researches of Warburg have recently shown that the phenomenon of respiration is to a large extent controlled in the cell by the presence of iron, and wherever we seek in the living kingdom we

find iron occupying an essential part in one form or another. In all cells there is an iron-containing pigment known as cytochrome, which stands in direct relationship to the great family of blood pigments known as the hæmoglobins, and evidence is accumulating to show that in the evolution of these pigments of the higher animals there has been a steady change of the molecular type so that the properties of the pigment will be adapted to the conditions under which it is to serve the organism. The specificity of the hæmoglobins is bound up with the protein part of the molecule since it has been shown that all these pigments contain the same iron-containing unit. Even more essentially a "life" process than respiration is the phenomenon of reproduction, and yet, if we examine this process from the biochemical aspect we find that even the processes of fertilisation and cell division can be controlled in the laboratory by simple physical and biochemical methods. The modern theory of heredity based on an association between inherited characters and the presence of certain structural units known as chromosomes interest us in the nature of these remarkable bodies. The chromosome of the chromatin material from reproductive cells on examination by biochemical means is revealed as being a simple nucleo-protein, and the high degree of specificity implied by the chromosome theory of heredity seems to lie in the protein moiety. The remarkable work of Dakin and his colleagues has taught us that biological specificity of proteins is probably correlated with the arrangement of amino-acids in the protein molecule, and if this view is correct it is not improbable that a large proportion of the life processes of an animal are controlled by this simple biochemical fact.

CALENDAR OF FORTHCOMING EVENTS

- Apr. 1. SOCIETY OF CHEMICAL INDUSTRY. *Joint meeting of the Chemical Engineering Group and the Institution of Mechanical Engineers*, to be held at Storey's Gate, St. James's Park, S.W.1, at 6 p.m. "Lubricating oils—laboratory tests in relation to practical results," by A. G. Marshall and C. H. Barton.
- Apr. 1. SOCIETY OF CHEMICAL INDUSTRY, *Manchester Section*. Annual General Meeting, 16, St. Mary's Parsonage, Manchester, at 7 p.m. "The work of the National Physical Laboratory," by Dr. W. Rosenheim.
- Apr. 1. WEST OF SCOTLAND IRON AND STEEL INSTITUTE. Annual Meeting. Royal Technical College, Glasgow, at 7 p.m.
- Apr. 4. SOCIETY OF ENGINEERS. Ordinary Meeting. Apartments of the Geological Society, Burlington House, Piccadilly, W.1, at 5.30 p.m. "Some aspects of reinforced concrete," by G. C. Workman.
- Apr. 4. INSTITUTION OF THE RUBBER INDUSTRY, *London and District Section*. Engineers' Club, Coventry Street, W.1, at 8 p.m. "Rubber statistics," by H. E. Miller.
- Apr. 4. SOCIETY OF CHEMICAL INDUSTRY, *London Section*. *Joint meeting with the Fuel Section*. Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. "The international conference on bituminous coals at Pittsburgh," by Dr. R. Lessing.

- Apr. 5. **SOCIETY OF CHEMICAL INDUSTRY, Birmingham and Midland Section.** University Buildings, Edmund Street, Birmingham, at 7.15 p.m. "Ultra violet light," by A. A. King.
- Apr. 5. **HULL CHEMICAL AND ENGINEERING SOCIETY,** Hull Photographic Society's Rooms, Grey Street, Park Street, Hull. Annual Meeting.
- Apr. 6. **SOCIETY OF PUBLIC ANALYSTS,** Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. (1) "The sequence of strokes in writing," by C. Ainsworth Mitchell and T. J. Ward. (2) "Some observations on the wasting of gluten from flour"; and (3) "A numerical expression for the colour of flour," by D. W. Kent-Jones and C. W. Herd. (4) "The determination of free mercury in commercial products," by H. B. Dunicliff and Kishen Lal. Informal dinner at 6.30 p.m. at the Popular Café, Piccadilly, W.1.
- Apr. 6. **INSTITUTION OF CIVIL ENGINEERS,** Great George Street, Westminster, S.W.1, at 6 p.m. Discussion on "Methods of preserving structures," opened by F. E. Wentworth-Sheilds.
- Apr. 7. **OPTICAL SOCIETY,** Imperial College of Science and Technology, South Kensington, S.W., at 7.30 p.m. Ordinary Meeting.
- Apr. 7. **OIL AND COLOUR CHEMISTS' ASSOCIATION,** Rooms of the National Federation of Paint Manufacturers, 8. St. Martin's Place, Trafalgar Square, W.C.2, at 8 p.m. "The yellowing of linseed oil," by Dr. R. S. Morrell and S. Marks.
- Apr. 7. **CHEMICAL SOCIETY,** Burlington House, Piccadilly, W.1, at 8 p.m. Ordinary Scientific Meeting. (1) "Trypanocidal action and chemical constitution. Part VI. Amphoterie α -carbamidoarylsarbinic acids," by H. King. (2) "On active nitrogen. Part III. Active nitrogen and the metals," by E. J. B. Willey.
- Apr. 8. **SOCIETY OF DYERS AND COLOURISTS, Manchester Section.** Literary and Philosophical Society, 36, George Street, Manchester, at 7 p.m. Annual Meeting. (1) "Photographic effects on cellulose acetate," by A. J. Hall and R. A. Hill. (2) "Note on the effect of light on coloured cotton fabric," by Miss Hibbert. (3) "The dyeing of cotton containing neps," by J. G. Lawrie. (4) "A new aim for the Society," by R. V. Taylor. (5) "Some notes on an emulsifying medium," by G. M. Williams.
- Apr. 8. **SOCIETY OF CHEMICAL INDUSTRY, Chemical Engineering Group.** The meeting arranged for this date has been postponed.
- Apr. 8. **INSTITUTE OF METALS, Sheffield Local Section.** The University, St. George's Square, Sheffield, at 7.30 p.m. "Refined silver for electro-plating anodes," by E. A. Smith.
- Apr. 11. **INSTITUTION OF ELECTRICAL ENGINEERS,** Savoy Place, Victoria Embankment, London, W.C.2, at 7 p.m. "The maintenance of small electric power plants." Discussion opened by T. Hodge.
- Apr. 11. **CERAMIC SOCIETY,** North Staffordshire Technical College, Stoke-on-Trent, at 7.30 p.m. Annual Meeting.
- Apr. 12. **INSTITUTION OF PETROLEUM TECHNOLOGISTS,** House of the Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m. "Jet and jetonised material," by E. H. Cunningham-Craig.

CHEMICAL SOCIETY

The Annual General Meeting was held on March 24, the President, Prof. H. Brereton Baker, C.B.E., F.R.S., occupying the Chair. The Report of the Council, Balance Sheets, and Statements of Accounts were, on the proposal of Mr. Grant Hooper, seconded by Mr. J. H. Coste, adopted; the vote of thanks to the auditors was proposed by the Treasurer, Prof. J. F. Thorpe, C.B.E., F.R.S., seconded by Dr. P. C. Austin, and acknowledged by Dr. G. W. Monier-Williams, O.B.E. Dr. O. L. Brady, Dr. A. E. Dunstan, and Dr. G. W. Monier-Williams were elected to act as Auditors for 1927. A vote of thanks to the Treasurer, Secretaries and Foreign Secretary, Council and Committees for services during the past year was proposed by Dr. J. A. Voelcker, seconded by Prof. A. Findlay, and acknowledged by Prof. J. C. Philip, O.B.E., F.R.S.

The President next presented the Longstaff Medal for 1927 to Prof. Robert Robinson, F.R.S., remarking that it is the highest honour which the Society can bestow; in expressing thanks for such encouragement, Prof. Robinson acknowledged the great assistance which he had received in his investigations from his colleagues.

For conspicuously meritorious work, particularly in the separation of the pure hormone from the thyroid gland and the synthesis of thyroxin, which is indistinguishable both chemically and physiologically from the natural product, the Harrison Memorial Prize was awarded to Dr. C. R. Harington by the President on behalf of the Harrison Memorial Prize Selection Committee. Dr. Harington, in his acknowledgement, said that his work, although chemical, had been conceived, and would be applied, in the domain of medicine.

Prof. Baker then delivered the Presidential Address, entitled "Experiments on molecular complexity." The observation that if liquids of varying types were subjected to prolonged drying the boiling points were considerably raised, suggested that the molecules increase in complexity when the catalyst (water) is removed, and that all liquids may be capable of association. Although the inability of molecules to associate together in the absence of water might be conceived, dry liquids boiling at sub-normal temperatures had not yet been obtained. The investigation, however, had now been extended to catalysts other than water, involving determinations of vapour pressure and surface tension.

Preliminary results, whilst not quantitatively reproducible, demonstrated the influence of the presence of charcoal on the vapour pressure of ether, methyl alcohol, and benzene; an extension of the investigation showed that a catalyst acts very slowly, sometimes at first even in a direction contrary to that finally observed, and that a pure liquid appears to possess no constancy of composition. However, experiments in which the vapour pressure of the liquid alone was balanced against that of the liquid with the catalyst showed an increase of the vapour pressure of the liquid in contact with the catalyst over that of the liquid alone.

Measurement of the vapour pressure of water in the presence of charcoal, platinum, or thoria showed that heating has the same ultimate effect, but that the interval

between the actual heating and the appearance of the effect varies with the different catalysts.

Ramsay and Shields' method was employed for the determination of the surface tension, the containing tubes being made of specially resistant glass. Marked changes in the molecular weight of acetic acid and water were observed, but the catalyst (charcoal, platinum black, or thoria) did not appear to produce its maximum effect immediately. Moreover, the process of filling the tube, involving boiling the liquid to remove air, evidently caused dissociation, the control liquids requiring three weeks to return to the normal molecular weight. Again, heating for a short period only generally increases the molecular complexity, whilst heating for a long period decreases it, as would be expected.

Quantitative agreement between the vapour pressure and surface tension results would not be anticipated, since the latter indicate the average complexity of the molecules, whereas the former are largely attributable to the smaller molecules present. Nevertheless, it would appear that all liquids may be regarded as analogous to a dissociable gas such as nitrogen peroxide, although their dissociation and association are much slower processes than those in gases.

The President exhibited a two-limbed tube into which, three weeks previously, there had been placed equal volumes of bromine, and, in one limb only, a piece of charcoal. In the interval bromine had distilled from one limb to another, leaving the charcoal almost dry.

A vote of thanks to the President for his services in the Chair and for his address was proposed by Prof. W. P. Wynne, F.R.S., seconded by Prof. A. Lapworth, and briefly acknowledged.

The President then announced that the following would hold office for the ensuing year: President, Prof. H. Brereton Baker, C.B.E., F.R.S.; Vice-Presidents who have filled the office of President, Prof. H. E. Armstrong, F.R.S., Prof. H. B. Dixon, C.B.E., F.R.S., Prof. P. F. Frankland, C.B.E., F.R.S., Dr. A. Scott, F.R.S., Prof. W. P. Wynne, F.R.S.; Vice-Presidents who have not filled the office of President, Prof. J. B. Cohen, F.R.S., Prof. G. G. Henderson, F.R.S., Sir Robert Robertson, K.B.E., F.R.S., Prof. R. Robinson, F.R.S., Dr. N. V. Sidgwick, F.R.S., Prof. A. Smithells, C.M.G., F.R.S.; Treasurer, Prof. J. F. Thorpe, C.B.E., F.R.S.; Secretaries, Dr. T. Slater Price, O.B.E., F.R.S.; Prof. C. S. Gibson, O.B.E.; Foreign Secretary, Prof. F. G. Donnan, C.B.E., F.R.S.; Ordinary Members of Council, Mr. M. P. Appleby, Prof. H. Bassett, Mr. E. R. Bolton, Prof. H. V. A. Briscoe, Prof. J. E. Coates, O.B.E., Prof. J. C. Drummond, Dr. F. A. Freeth, O.B.E., F.R.S., Mr. F. W. Gamble, Prof. R. Whytlaw Gray, O.B.E., Dr. J. Kenyon, Dr. T. J. Nolan, Prof. K. J. P. Orton, F.R.S., Dr. R. H. Pickard, F.R.S., Mr. B. D. Porritt, Dr. E. K. Rideal, M.B.E., Prof. J. F. Spencer, Mr. G. Stubbs, C.B.E., Prof. F. J. Wilson.

In the evening the Anniversary Dinner was held at the Edward VII Rooms, Hotel Victoria, London, the President occupying the Chair.

The Loyal Toasts having been honoured, the Right Hon. Viscount Sumner, G.C.B., proposed the toast of the Chemical Society, expressing the hope that the prosperity which had attended the Society since 1841

would long continue. In a delightfully humorous speech, he remarked that lawyers differ from chemists in their lack of desire to know more of things in the abstract, although the investigator perpetually found himself on the verge of the unknowable as well as the unknown.

The President, replying, commented happily on the international character which the gathering had acquired by the presence, as guests, of Prof. Camille Matignon and Prof. Schlenk; he regretted the absence through indisposition of Prince Ginori Conti, President of the Italian Chemical Society. During the past year the Society had sustained a heavy loss in the deaths of Dr. A. W. Crossley and Sir William Tilden, respectively the youngest and oldest Past Presidents. Earlier in the day he had given, as his Presidential Address, a purely experimental paper, saying that he shared with Sir Isaac Newton the motto: "Hypotheses non fingo." Maturer consideration led him completely to reverse that description of his attitude; he was, in fact, an inveterate maker of hypotheses which, however, he never published. Prof. Baker referred in this connexion to Liebig's account of his error in mistaking bromine, subsequently discovered, for "liquid chloride of iodine," and advised his younger colleagues: "Make as many theories as you like, but don't publish them."

Sir William J. Pope, K.B.E., F.R.S., who proposed the toast of the Guests, coupled with the names of Sir Ernest Rutherford, O.M., President of the Royal Society, Prof. Camille Matignon, representing the Société Chimique de France, and Hofrat Prof. Dr. Wilhelm Schlenk, President of the Deutsche Chemische Gesellschaft, humorously spoke of the obsolete character of the term "physics"; the President of the Royal Society was the most notable *chemist* of the first quarter of the twentieth century.

Sir Ernest Rutherford dwelt on the close relationship existing between chemistry and physics. The interaction of these branches of science would doubtless lead to a greater elucidation of atomic structure, when that complex but fundamental problem of chemical combination might be attacked. The study of the crystalline forms of elements, and afterwards of compounds, seemed to offer a promising line of advance.

Prof. Matignon and Prof. Schlenk both replied in terms of cordial goodwill.

SOCIETY OF GLASS TECHNOLOGY

A meeting was held in the University of Birmingham, on March 16, Mr. Herbert Webb in the Chair. Two papers were presented:—

"Some further developments in recuperative glass furnaces," by Th. Teisen, C.E. A new design of recuperator was described in which there was an increase in efficiency for two reasons:—(1) The greater heating surface ensured a higher temperature of the secondary air; (2) The reduction in space resulted in smaller radiation and convection losses. The recuperator comprised a main tube of special design, combining the features essential for efficiency, and certain auxiliary shapes, which together with the tube, were required for building up a unit. When built on the 2-recuperator principle, the design outlined had certain drawbacks, to overcome which a new design was developed on what

the author called his "Tetra" recuperative principle. This design had 4 recuperators instead of 2, arranged symmetrically in each corner of the base, and, for large furnaces, afforded the following advantages, compared with the 2-recuperator principle:—

(1) Short length of recuperator, enabling it to be cleaned or repaired from the front in its full length; (2) More efficient waste heat recovery; (3) In case of repair or cleaning, one recuperator could be shut off altogether and the furnace kept going with the remaining three; (4) The waste gas collecting flues and the glass pits could be arranged (nearly) symmetrically in relation to each other. For very large types, provision had been made to divide the side pockets into two, so as to make each recuperator of a pair absolutely independent of each other. The author also described a simple application of a patent system of oil firing. All new pot furnaces were designed with a view to being fired on this system in case of emergency, as it entailed only slight modification of the design of the pocket. Furnaces working on this system could be fired, either with oil alone, or with coal or producer gas in the ordinary way, combined with oil as auxiliary fuel.

"The properties of some soda lead oxide glasses," by Violet Dimbleby, M.Sc., S. English, D.Sc., Prof. W. E. S. Turner, and F. Winks, M.Sc.Tech. Prof. Turner, in presenting this paper, observed that although potash was more often used than soda in these glasses, nevertheless, the properties of one kind had a bearing on the properties of the other. The investigations made were systematic, and aimed at the determination of the effect, which was produced by increasing progressively the proportion of lead oxide at the expense of the soda. In this way it was found that successive replacement of soda by lead oxide gave glasses with progressively decreasing annealing temperature and thermal expansion. Comparison was also made with glasses containing barium oxide, which were of much commercial interest. The action of boiling water on the glasses was investigated, and the percentage loss in weight determined. It was found that lead oxide glasses were better than those containing lime, while those containing barium oxide were the worst of the series. A new set of factors was determined by which the thermal expansion of lead oxide and barium oxide glasses could be calculated. The factors originally proposed by Winkelmann and Schott in 1895, had been found to need revision, and the following were the new values: SiO_2 , 0.15; ZnO , 0.21; Al_2O_3 , 0.52; ZrO_2 , 0.69; MgO , 1.35; PbO , 3.18; CaO , 4.89; BaO , 5.2; Na_2O , 12.69; K_2O , 11.7.

The reading of the third paper on the agenda was postponed, namely, "The thermal expansion of some boric oxide containing glasses," by Prof. W. E. S. Turner and F. Winks, M.Sc.Tech.

PHYSICAL SOCIETY

At the meeting held on March 11, a paper on "A comparison of the behaviour in thermal diffusion of nitrogen and carbon monoxide, and of nitrous oxide and carbon dioxide" was communicated by T. L. Ibbs and L. Underwood, in which the thermal diffusion of the former pair of gases in hydrogen, carbon dioxide and nitrous oxide, and of the latter pair of gases in hydrogen,

oxygen, nitrogen and carbon monoxide were investigated. The thermal diffusion of ethylene and hydrogen was also examined. By thermal diffusion it is to be understood the separation which occurs in a binary mixture of gases when a temperature gradient is established in the mixture. It has been independently shown by Enskog and Chapman that the effect depends on the masses and diameters of the gas molecules, upon the proportions in which the gases are mixed, and upon the field of force of the molecules. The pair of gases nitrous oxide and carbon dioxide have practically the same molecular weights and sizes. The same is true of the pair nitrogen and carbon monoxide. Theory predicts that in such cases the effect will disappear whatever the nature of the fields of force. The molecule of C_2H_4 has the same weight as the molecule of CO and N_2 , but is different in size and the number of atoms in the molecule. As the thermal conductivities of the respective pairs are practically the same, direct observation of thermal diffusion in the pairs was difficult. The phenomenon was therefore observed of the thermal diffusion of the respective gases in the series of gases referred to above. The results confirm those predicted by theory; in all cases the heavier molecules move to the cold side and the lighter molecules to the hot side. The form of the composition-separation curves was symmetrical when the rates of masses of the component gases was small, e.g., O_2 and CO_2 . For mixtures containing hydrogen in which the mass-ratio is large the curves are unsymmetrical, the maximum separation corresponding with a mixture considerably richer than 50% in hydrogen. The thermal diffusion of a gas in nitrogen or carbon monoxide is practically the same. This is true also of the pair nitrous oxide and carbon dioxide. The separation obtained in mixtures of ethylene and hydrogen is less than that obtained in mixtures of nitrogen or carbon monoxide and hydrogen. The molecular fields of N_2 and CO are closely alike, whilst the CO_2 molecule is slightly harder than the molecule of nitrous oxide.

R. R. Nimmo discussed the "Relighting of a neon-filled lamp when momentarily extinguished at voltages below the striking potentials," and showed that the time during which the continuous discharge of a neon lamp may be interrupted without extinguishing the lamp is of the order 500 micro-seconds, and depends on the operating voltage and current in the lamp. The ensuing discussion indicated that individual lamps differ markedly amongst themselves—a result possibly attributable to the impurities present in the filling gas.

Dr. G. M. B. Dobson and I. O. Griffiths submitted a paper on "Measurements of absorption coefficients of light filters." A portion of the slit of a spectrograph is covered by the filter, and the transmitted light is incident upon a photographic plate after passing through a neutral wedge. The plate is also illumined in another part by light which has traversed the wedge only. From a knowledge of the distance between two points in the respective spectrograms, which are of the same density, the absorptive coefficient of the filter can be ascertained.

A paper by G. B. Deodhar on "Electricity of dust clouds" was taken as read.

CORRESPONDENCE

THE MERCENARY MOTIVE

SIR,—I have read your recent Editorials with much pleasure, and especially the note on Beethoven in the issue of March 25. But why spoil a delightful sonatina by intruding the jarring notes of self-interest and the mercenary motive—"the average chemist . . . must do the things and love the things which his fellow voyagers consider essential to culture" because "to live within the narrow confines of his own profession is unprofitable . . ."? We must be a sordid lot indeed if the only way to make us alive to outside interests is the hint that the boss likes it, and, anyhow, it is the thing to do.

Renaissance music with its often beautiful melodies but somewhat stereotyped or staid forms, the equally lovely melodies and more varied form of the Handel and Bach periods, developed into what, to some, seems the most happy blend of tunefulness with complexity of form and richness of harmony which characterises much of the subsequent work of the nineteenth century, and some would say that harmony has nearly vanished, and melody quite, from some kinds of present-day music.

Yet each of these has its special appeal for one or other of most of us, and rightly so. The lover of Beethoven does not care whether his liking is "profitable" (nor, by the way, whether the current welcome opportunities of revelling in the master's music are strictly artistic or partly mechanistic in origin, *i.e.*, based merely on the coincidence of the lapse of a conventional time-unit since Beethoven's biochemical mechanism ceased to operate).

These things are an allegory: freedom of taste is essential to the pursuit of culture, and the latter, whether as regards Beethoven or bridge, is *not* profitable if undertaken as a compulsory form of relaxation because it is profitable—which is a self evident paradox.—I am, Sir, etc.

T. P. HILDITCH

The University,
Liverpool

TREATMENT OF EMPLOYEES

SIR,—I was astounded to read in the report of the Imperial Chemical Industries, Ltd., published last Saturday, that the chairman (Sir Alfred Moud, Bt., P.C., M.P.) remarked that he had seen statements, although in irresponsible quarters, that the I.C.I. were not regarding the welfare of employees. That such statements are entirely baseless and untrue—to quote Sir Alfred's own words—can be easily ascertained and verified by a visit to Billingham, where the synthetic ammonia undertaking is being carried on.

In that village, the reports of wage-reduction, worse conditions of labour and the two-generations-old regard for the welfare of employees showing signs of collapse, is treated with the utmost scorn and ridicule.

Never were workmen more satisfied, better cared for and well treated—and this applies not only to servants, but to all employees.

Even in the event of decease, dependents are not forgotten. In proof of which, a very near relative of mine, who had only been in the service of the Synthetic

Ammonia Company (since associated with the I.C.I.) for about five years, died quite recently. Not only was the rent of the house he had lived in reduced, but provision was made for the immediate needs of his widow, his daughter was given employment with the company, and assistance was rendered towards providing for the future careers of two sons.

I am confident that this is not by any means an isolated instance of the generosity and full-heartedness of the firm, whose conduct towards employees has been, in some quarters, so grossly and shamefully maligned.

Yours faithfully,

HENRY ALLEN ASHTON

PERSONAL AND OTHER ITEMS

Mr. Henry Thomas Tizard, C.B., A.F.C., F.R.S., has been appointed by His Majesty the King in Council to be Secretary to the Committee of the Privy Council for Scientific and Industrial Research on the retirement of Sir H. Frank Heath, K.C.B., from that office on June 1 next.

The Institution of Mining and Metallurgy has awarded its gold medal to Emeritus Professor William Frecheville in recognition of his services to the mining industry during a long and distinguished professional career and to mining engineering education.

This week the Goldsmiths' Company is celebrating its 600th anniversary.

The late Mr. Roscoe Brunner, lately chairman of Brunner, Mond and Co., Ltd., left unsettled property of the gross value of £146,948.

The late Mr. T. Warburton, O.B.E., managing director of the Bleachers' Association, Ltd., left £65,092, with net personalty £60,770.

The late Mr. F. Whowell, J.P., a managing director of the Bleachers' Association, Ltd., left £103,975, with net personalty £63,818.

Conference of Teachers in Technical Institutions

The Annual Conference of the Association of Teachers in Technical Institutions will be held this year at Plymouth, from Friday, June 3, to Tuesday, June 7. The provisional programme includes, in addition to the business of the Conference, a number of visits. Arrangements are being made to visit, amongst other places, the Seale Hayne Agricultural College and the Marine Biological Laboratory. An important feature will be an educational and industrial exhibition in the Guildhall from June 4 to 10.

Trade Alloys

The Institute of Metals receives such numerous enquiries for the names of the manufacturers of the thousands of "trade alloys" that exist, that it has been decided to compile a list of "trade alloys," together with particulars of their composition and uses, as well as the names of manufacturers or agents in Great Britain. Persons interested are invited to forward to the Secretary, 14, Members' Mansions, London, S.W.1, the following particulars:—(1) Name of alloy. (2) Manufacturer or agent supplying. (3) Composition. (4) In what form supplied. (5) Uses.

Canadian Pulp and Paper Industry

The properties of the Mattagami Pulp & Paper Co., Ltd., have passed into the hands of the Abitibi Power & Paper Co. The Smooth Rock Falls, Ont., mill, which was acquired, has a manufacturing capacity of 50,000 tons of high-grade sulphite pulp per annum, of which 30,000 tons is bleached pulp. The timber limits taken over are approximately 965 square miles of spruce pulpwood lands.

Eucalyptus in Artificial Silk Manufacture

Some recent work in Australia is reported to have shown the possibility of using eucalyptus wood for the manufacture of artificial silk. Slight modifications only are needed in the methods actually used in producing the pulp to enable the pulp to be used in making artificial silk.

Nitrogen Fixation in the U.S.A.

Lazote, Inc., which utilises the Claude process at its Belle synthetic ammonia factory, has sued the Niagara Ammonia Co. and the Ammonia Corporation for alleged infringement of three of the Claude patents. The Ammonia Corporation owns the American rights to the Casale process, and its subsidiary, the Niagara Ammonia Corporation, is operating a Casale ammonia plant at Niagara Falls.

Chilean Nitrate and the I.-G.

It is reported that the German Dye Trust has applied for a Chilean patent to cover a process which, it is claimed, will enable the production of Chilean nitrate to be improved.

A New Anæsthetic

It is reported from Berlin that the German Dyestuffs Trust has produced a new anæsthetic, known as "E 107," which is administered rectally, produces complete anaesthesia in 7 or 8 min., and does not give rise to reflexes, relaxation being complete and the pulse normal. There seem to be no after-effects, except, in a few cases, intestinal irritation and cyanosis, and elimination takes place quickly. The chemical composition of "E 107" has not been disclosed. On account of certain disadvantages, which, it is hoped, will be overcome, the new anæsthetic will apparently not be placed on the market as yet.

New Process for making Cellulose Pulp

A group of United States financiers has bought the American rights to a process invented by a Hungarian chemist, Dr. B. Dorner, which, it is stated, enables the highest grade chemical pulp to be made on a commercial scale from maize stalks more cheaply than from wood or cotton. Three tons of maize stems (cornstalks) are required, against 2.5 tons of wood, to make a ton of chemical pulp, but the maize is waste material which costs very little, and is generally burned. The pulp is said to contain 99.3% of pure cellulose.

Swiss Exports of Dyes to Germany

According to the U.S. Trade Commissioner at Berlin. Swiss dye producers are now able to export to Germany, the exports in September and October last reaching values of 870,000 francs and 1,030,000 francs respectively. The reason, it is stated, is ascribed to the high prices charged by the I.-G.

REVIEWS

REMINGTON'S PRACTICE OF PHARMACY. By E. FULLERTON COOK, P.D., Ph.M., and CHARLES H. LA WALL, Ph.M., Pharm.D., Sc.D., F.R.S.A., and collaborators, Seventh edition. Pp. xxiv + 2090. London: J. B. Lippincott Company, 1926. Price: 45s. net.

The seventh edition of this well-known work is a valuable corollary to the issue of the Tenth Decennial Revision of the United States Pharmacopœia, 1926. It contains, in addition to the official drugs and preparations of the U.S.P., those of the National Formulary, fifth edition, 1926, and many new and unofficial preparations. As in former editions, the monographs are not arranged alphabetically, similar substances being dealt with in groups. To the sections dealing with Inorganic and Organic Chemical Compounds, new chapters have been added entitled "Theory of Inorganic Chemistry" and "Theory of Organic Chemistry." These occupy 17 and 14 pages respectively, of which two are allotted to the determination of "Ionic Dissociation," as the hydrogen-ion concentration is designated. The information in these chapters is too meagre to be of much value, and may even be misleading, as in the statement:—"The hydrazines are related to the diazo compounds except that the union between the nitrogen is by one bond, and that one of the nitrogen atoms is attached to hydrogen only," by its remaining two bonds." The words italicised are not an essential condition to a hydrazine, which may be considered as diamidogen with any or all of its hydrogen atoms replaced by radicles.

Other new chapters deal with Perfumery and Cosmetics, Commercial Law, Business Administration, Manufacturing Pharmacy, Biological Products, Serums, Vaccines and Protein Therapy. Brief mention is made of vitamins, and details are given for carrying out feeding tests on cod-liver oil for the determination of antirachitic and vitamin A potency.

The section dealing with Pharmaceutical Analysis has been considerably extended. "Urinalysis" has a chapter to itself, and the volumetric and proximate assays of the Pharmacopœia are fully explained, and in addition methods are given for the analysis of hypodermic tablets, with proposed tolerances which range from 7.5 to 10%. The method for arecoline hydrobromide tablets consists of titrating the bromine radicle by means of silver nitrate. The active constituent arecoline is not determined.

Under biological assays are given particulars of those used for digitalis, squill, strophanthus, aconite, cannabis, ergot, epinephrine and pituitary.

The formulæ for pharmaceutical preparations are given both in the metric system as in the U.S.P. and also in avoirdupois and U.S. fluid measure. The latter, it should be remembered, is not equivalent to English measure.

The edition is exceedingly well put together, the English is good and almost free from American phonetic spelling, the type is clear, and it is very readable. Printing errors are few; on page 543, W. M. Clark is given as M. W. Clark, and the brackets in the formulæ for the conversion of specific gravity to Baumé degrees on page 59 have been omitted. In the formula for epinephrine on page 1195, CH₂ should read CH₃.

Although the number of pages has been increased by 103, the thickness of the volume has been reduced materially by the use of thinner paper. The book will be found very useful for reference on all pharmaceutical matters, and although intended primarily as a handbook for the United States pharmacist, much of the information will be invaluable to pharmacists in any country.

T. TUSTING COCKING

TECHNOLOGIE DER FETTE UND ÖLE. By KARL LÖFFEL. Pp. viii + 510. Brunswick: F. Vieweg & Son, 1926. Price: paper, 35 r.m.; bound, 38 r.m.

After an opening section, comprising some 80 pages, dealing with the chemistry of glycerin, fatty acids and the fatty oils, the author proceeds to deal fully with the raw materials (and their production) from which fatty oils are derived. In considerable detail the operations of crushing and extraction of oil-bearing seeds and fruits, and the rendering of animal fats and marine animal and fish oils are dealt with, whilst the section devoted to oil refining and deodorising is very thoroughly treated. Following this, important technical details regarding the individual oil-bearing fruits and seeds, the characteristic features and uses of the oils derived from them are given; similarly, the principal features relative to tallow, butter, whale, fish and liver oils are given adequate consideration. The final section, comprising some 130 pages, deals with such manufacturing operations as the production of margarine and compound fats, oil hydrogenation, the numerous methods of saponification in use, and the distillation of fatty acids and the production of glycerin and its subsequent distillation.

The author is to be congratulated on a well-written volume dealing very fully and in a practical manner with the industries embraced within the scope of the work, whilst the numerous drawings, besides being clear, add considerably to an understanding of the subject matter. Books of this type are too often burdened with a bulk of information properly belonging to those of an analytical character, thus leading to a scanty treatment of the technological aspect of the subject matter, but the present volume is free from this defect, and is likely to prove of valuable assistance to those engaged in the fatty oil industries.

There are but few references to original technical papers, though numerous patents are quoted, mainly of German origin; this constitutes the only serious fault in an otherwise well-written, well-printed, and carefully indexed volume.

H. M. LANGTON

A HANDBOOK OF ORGANIC ANALYSIS: QUALITATIVE AND QUANTITATIVE. By Dr. H. T. CLARKE, with an introduction by Prof. J. NORMAN COLLIE, Ph.D., F.R.S. Fourth edition. Pp. xii + 363. London: E. Arnold & Co., 1926. Price: 8s. 6d.

The paucity of text-books on the examination of unknown organic compounds is good evidence of the difficulty of framing a really systematic and up-to-date course. Dr. Clarke, whose book, which first appeared in 1911, has now been enlarged and largely rewritten, is to be congratulated on his success in this direction.

Chapter I deals with preliminary investigations of organic compounds, and the only paragraph in this which could be amended is that on the test-tube method of

determining setting-point. Chapter II, describing the examination for radicles, contains a number of important reactions, which seldom find a place in the ordinary theoretical text-book. It may be mentioned in passing that primary and secondary, as well as tertiary aromatic (and only aromatic) amines form sparingly soluble hydroferrocyanides. Chapter III describes the separation of organic compounds. Chapter IV, which is exceptionally complete, consists of over 180 pages of classified tables of the common organic compounds, and gives physical constants of at least two derivatives in each case.

Chapters V and VI, covering 42 pages, represent the total space assigned to purely quantitative work, and for that reason the book seems somewhat out of balance. The author himself emphasises the importance of quantitative work in his scheme of ultimate identification, and one would have wished that more space had been given to this side of the subject. The estimation of carbon and hydrogen in nitrogenous compounds, and the desirability of a blank test prior to the estimation deserve mention in a practical text-book. The reviewer would suggest also the incorporation of estimations involving the use of nitrite, titanous chloride, and diazonium solutions, all of which are of great technical importance. The book closes with a chapter on the determination of physical properties, followed by an excellent index.

The work still remains the best of its kind, and all students of organic chemistry are indebted to its author for bringing within their reach a very useful and valuable book.

W. M. CUMMING

THE PHYSICAL CHEMISTRY OF STEEL-MAKING PROCESSES: A GENERAL DISCUSSION HELD BY THE FARADAY SOCIETY AND THE IRON AND STEEL INSTITUTE. Pp. 128. London: The Faraday Society, 1926. Price: 8s. 6d.

The reactions which occur during the conversion of pig iron and steel are of great interest to physical chemists as well as to metallurgists, since they involve equilibria between solids, liquids and gases under conditions of varying temperature and composition of the phases concerned, whilst the large scale on which they are carried out introduces new and interesting factors. The problems which they involve are of far more than academic interest, for the successful manufacture of steel demands an accurate control of the relations of metal, slag, and gas. A knowledge of the kinetics of chemical change in the steel furnace is essential to the improvement of the practice of steel making, and there are few branches of applied chemistry in which the contact between theory and practice is so close. The subject of the discussion held by the Faraday Society and the Iron and Steel Institute is therefore a very important one, and several of the papers which were read are of real value for the understanding of the reactions of the steel furnace. Many chemists have determined the equilibria between the oxides of iron and carbon and the two elements, and between the same oxides and hydrogen, but the values of different investigators have not always been concordant, largely owing to the slowness with which equilibrium is reached. Dr. McCance has undertaken the comparison of existing data, and by grouping the balanced reactions in such a way that they may be made to check one

another, by using a system of simultaneous equations, has been able to provide a test for the probable accuracy of series of observations, and by elimination has arrived at values for the equilibrium constants which have a high degree of probability. This is an excellent piece of work, and its value should be appreciated by all metallurgists. The possible equations are very numerous, and the completion of the scheme will involve much further labour. The papers by Mr. Colclough on the basic open-hearth furnace and by Mr. Sisco on the basic electric process contain much useful information. An ingenious attempt to represent the balanced reactions in a new way, without assuming any values for heats of reaction or oxygen pressures, is made by Mr. Feild, but the calculations are based on a single basic heat, and the reasoning will not be generally accepted by chemists. The other papers are also of interest, and in the course of the discussion several metallurgists were able to criticise the views submitted by the principal speakers on the basis of practical experience. This is one of the most useful of the Symposia held under these auspices.

C. H. D.

DIE TROCKNUNG UND SCHWELUNG DER BRAUNKOHLÉ DURCH SPÜLGASE. By DR. B. HILLIGER. Pp. 123. Berlin: Julius Springer, 1926. Price: paper, 10.50 r.m.

Nowhere more than in Germany has necessity been the mother of invention. Faced, during recent years, with a shortage of home-raised coal, she has fallen back upon her considerable reserves of lignite for fuel briquettes. Faced, also, with an increasing consumption of fuel oils and her own poverty in natural oil deposits, she has set to work to found an oil-producing industry by the low-temperature carbonisation of her lignite. This industry is still, at the moment, in an experimental stage, but Dr. Hilliger's monograph gives a concise review of the ground already covered.

The problem handled is that of the production from lignite of primary tar and serviceable semi-coke by low-temperature carbonisation, using hot, inert gases (generally obtained by burning producer gas) as internal heating medium, and with it is bound up the previous drying of the lignite, which, in its raw state, contains roughly 50% of moisture. The book is written from both the practical and theoretical standpoint, and contains, amongst other considerations, descriptions and illustrations of the various types of plant that have been proposed, a review of the relevant patent literature, an account of the properties of the products obtained with cost sheets for their recovery, as well as detailed mathematical calculations of the quantity of inert gas required for drying and carbonising the mechanism of internal heating, and the efficiency realized.

Whilst the initial stimulus to the low-temperature carbonisation of lignite was given by the necessity for producing fuel oils, it is evident that this can be carried out economically only if a market is found for the semi-coke simultaneously produced, and there appears to be an opening for it as powdered fuel. Little or no use has hitherto been made of the gases of carbonisation, owing to their dilution with the inert heating gases, and there is evidently scope here for increasing the efficiency of the process.

It is inevitable that, in considering this problem of lignite utilisation, which has been the particular concern of chemists and engineers in Germany, the author should refer exclusively to work done and results obtained in that country. Nevertheless, it is certain that a study of this work will be of interest and value to all who have at heart the more efficient utilisation of all classes of low-grade coals.

W. T. K. BRAUNHOLTZ

PARLIAMENTARY NEWS

Poison Gas

Sir L. Worthington-Evans informed Major-General Sir Alfred Knox that the study of gas warfare was being actively pursued in Soviet Russia. Numerous factories were already set up, or were in course of erection, which would be able to produce poison gas on a very considerable scale. No useful purpose would be served by detailing the number and location of such factories, or by indicating their present and potential output.—March 15.

Leadless Glaze

Replying to Mr. Clowes, Sir W. Joynson-Hicks said that the number of potteries with leadless glaze certificates was 193. This figure included 22 low solubility glaze factories, which had satisfied the Chief Inspector of Factories that leadless glaze was used for a substantial part of the output, and were entitled under No. 2 of the Regulations to the same exemption as leadless glaze factories. The number of potteries with low solubility glaze certificates, excluding the 22 already mentioned, was 171, making a total of 364. The information given also included results of analyses.—March 15.

Coal Exports from India

Earl Winterton informed Mr. Gardner that according to the returns, 49,088 tons of coal was exported to the United Kingdom from India in 1926. The greater part of this arrived in the first two months of the present year. Only about 44,000 tons in all appear to have arrived here, the balance having presumably been diverted on the way. The declared value at the port of import averaged 59s. per ton.—March 21.

Spirits

In a written answer to Colonel Day, Mr. McNeill stated that the quantity of spirits distilled in Great Britain during the 12 months ended January 31 in each of the years 1925, 1926 and 1927 was as follows: 34,718,000 gallons, 36,895,000 gallons, and 27,780,000 gallons respectively.—March 21.

Beet Sugar Manufacture (Drying Processes)

Mr. Guinness informed Colonel Burton that two interim reports on experiments in drying processes for manufacturing beet sugar had been published, one as a White Paper by His Majesty's Stationery Office last year, and one as an article in the Journal of the Ministry of Agriculture for February, 1927. A full technical report was in an advanced stage of preparation, and would be published with as little delay as possible. Further, he was informed that a company had purchased certain patents for a process known as crop-drying or mass-drying which had been applied to sugar beet manufacture. These patents were partly owned by the Institute for Agricultural Engineering at Oxford, and

it was expected that considerable sums would be realised which would be expended on the scientific work of the Institute. No patents had been taken out in respect of recent investigations specifically into the manufacture of beet sugar. The experimental factory which had been erected for the purpose of these investigations had been sold, and a considerable part of the proceeds expended on the investigations would be returned directly to the Exchequer.—March 21.

Beet Sugar Industry

Mr. Guinness informed Mr. Runciman that the total amount of subsidy on sugar and molasses paid to British beet sugar factories in the manufacturing season 1925—26 was £1,124,207, and for the season 1926—27 was expected to be £3,200,000. The subsidy in the coming financial year, it was estimated, would amount to £4,500,000.—March 22.

In reply to Mr. Runciman, Mr. Ronald McNeill said that guarantees had been given to sugar-beet companies under the Trade Facilities Acts in respect of loans amounting to £2,215,000. March 24.

COMPANY NEWS

BRITISH DYESTUFFS CORPORATION, LTD.

The accounts for nine months to December 31, 1926, show a profit, before providing for depreciation on plant and buildings, of £82,934, or at the rate of £110,578 per annum, as compared with £253,517 for the previous twelve months. After providing £45,000 for depreciation, against £80,000, there remained £37,934, in addition to £78,005 brought in. The proportionate decline in the profit is attributed by the directors to the coal stoppage, which involved not only a substantial increase in manufacturing costs, but a reduced demand for the company's products. It is proposed to maintain the ordinary dividend at 2½%, less tax, absorbing £71,634, leaving £44,306 to be carried forward. Shareholders who exchanged their shares for shares in Imperial Chemical Industries, Ltd., retain their dividend rights up to December 31, 1926, and will consequently participate in the dividend to be paid on April 6, 1927.

BRITISH ALUMINIUM CO.

The report for 1926 shows a net profit of £438,776, plus £24,958 brought in, making £463,735 (£550,434 for 1925). Provision for taxation and proportion of profits payable to the directors absorbs £55,866, prior lien debenture service fund £60,000, debenture stock service fund £43,223, reserve for depreciation £50,000, reserve account £100,000, and staff benefit fund £10,000, leaving £144,644. A final dividend has been proposed on the ordinary shares of 6%, making 10%, less tax, leaving £26,567 to be carried forward.

BELL'S UNITED ASBESTOS CO., LTD.

There was a net profit for 1926 of £51,303, against £50,409 for 1925. The directors propose to maintain the dividend at 12½%, by a final payment of 10%, and to place a further £2,000 to pensions account, carrying forward £43,973, against £34,961 brought in.

SALT UNION, LTD.

The thirty-eighth annual meeting was held on March 22, Mr. G. H. Cox, J.P. (chairman), presiding. Despite

the disturbances in the industrial world during the last year, satisfactory results were shown in the report of the year's trading of the company, due to their successful coal buying, to the strenuous efforts made by their officials and staff, and to the loyalty of their employees. Although the gross profit declined by £89,000, more than half of this was due to the previous year's profits being swollen by amounts which were not ordinary trading items, and which therefore could not be repeated. Shipments to India declined by over 44,000 tons, owing to the strikes and interference with the facilities for shipment. With regard to the home trade, the Salt Manufacturers' Association had continued its efforts to regulate prices and to maintain its constituents' sales so far as possible in the face of the severe competition arising partly from new producers in this country and partly from foreign salt, notably German ground rock and solar salt for fishery purposes. The total import for the past year of all foreign salt showed a decline of 2,318 tons, but the total was still over 62,000 tons. The research department had developed a special germicidal salt which was being patented, which it was claimed would prevent the pink disease in hides. With regard to the Union's chief subsidiary, the Mersey Power Company, a dividend has been declared of 5%, being the first for six years owing to the installation of the electrical power plant.

HADFIELDS, LTD.

Presiding at the annual meeting held on March 28, Sir Robert Hadfield said the increasing severity of the conditions required to be met in the chemical engineering industries was placing greater and greater responsibility on the metallurgist and the chemical engineer. High-temperature conditions demanded materials of a character quite distinct from that used in the construction of apparatus working at ordinary temperatures and pressures. The phenomenon of heat-scaling provided another example of the urgent call for new materials, and particularly for those possessing resistance to chemical action, necessarily intensified by reason of the high temperatures involved. In this connexion distinct progress had been made, and the company's heat-resisting steel had been adopted for many parts in no less than sixteen of the new cruisers constructed for the British Admiralty, as well as for important parts of aeroplanes. The remedy which would ensure peace in industry was commonsense and goodwill; if we did not check the sequence of upheavals which had disorganised our trade and commerce during recent years, we should cease to be an industrial nation, and consequently would be unable to support our population.

BENZOL AND BY-PRODUCTS CO., LTD.

Payment of one year's arrears of preference dividend of 6%, less tax, will be made on April 1. The dividend is in arrear from March 31, 1925.

JOHN KNIGHT, LTD.

Presiding over the twentieth annual general meeting on February 18, Mr. Samuel Barnett (chairman) said that, despite the general strike and the coal strike, the balance sheet for the year showed a profit sufficient to cover the usual dividends and was actually larger in amount than that shown in two out of the last four

years. Sales of their principal products showed an increase over 1925. The profit made amounted to £148,509, against £156,507 for 1925 and £144,464 for 1924. In consequence of the increased prices due to the strike, an additional £12,000 had been paid for coal, oil, and electricity. It was proposed to place £10,000 to a pension reserve. The election of Mr. A. Webber as a director was confirmed, and the retiring directors (Mr. W. L. Helm and Mr. A. H. K. Squire) were re-elected.

EVANS, SONS, LESCHER AND WEBB

The report for 1926 states that the provisions of the scheme of arrangement sanctioned on October 19, 1925, have been carried out, and, in addition, the remaining half of the debenture stock has been redeemed. Out of the surplus arising from the terms under which the new company was reconstructed, the directors have been able to liquidate the whole of the expenses of the scheme, to write off good-will and trade marks in the old company's accounts, to provide substantial reserves on property, plant and debtors, and to place to a capital reserve account £12,248. The new company therefore commences operations free of debentures and with tangible assets only. After writing off all establishment expenses, and making provision for depreciation and bad and doubtful debts, there was a trading profit for the year of £23,536. A dividend has been recommended of 6% on the preference shares, and £7,660 will be carried forward.

PINCHIN, JOHNSON & CO., LTD.

Mr. E. Robson, presiding over the annual general meeting, on March 16, said the net profits for 1926 amounted to £148,339 (including £12,000 received as compensation for cancellation of an agreement). With £30,519 brought forward, there was an available balance of £178,858. The payment of the half-yearly dividend on the preference shares paid on January 1 last, and the interim dividend of 10% already paid on the ordinary shares, was confirmed, and a further dividend of 20% actual, less tax, was declared on the ordinary shares, making 30%, less tax, for the year. The general strike and the coal strike involved the company in a serious temporary setback, but it spoke well for the basic strength of their business that within a very short period of the end of the general strike they had made good the losses entailed. The company had built up a very substantial and successful business in China and the Far East, and the disturbances in China during the year had militated against the normal profit capacity of that market.

Sales for 1926 showed a satisfactory increase, whilst for 1927 an advance had been made over the corresponding period of last year. The meeting was followed by an extra-ordinary general meeting, which passed a resolution increasing the ordinary share capital by 300,000 shares, of which only 240,000 shares were to be issued for the present, for the purpose of giving effect to the deed of covenant entered into by the company for the acquisition of the business of Messrs. Docker Bros., of London and Birmingham. The directors considered that this development will prove an immediate source of substantially increased balance-sheet strength and earning capacity to the company.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—8s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
 Bisulphite of Lime—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4 ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£36 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammonic.—£45—£50 per ton. Chloride of ammonia £37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 per ton, home market, 1-cwt. iron drums included. Sod. Chlorate.—2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
 Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
 Arsenic, Sulphide, Yellow.—2s. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 2d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithophone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—5s. 3d. per lb.
 Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 5s. per ton. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£7—£10 per ton, according to grade and locality.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—1s. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 4s. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P.
 Wood Tar.—£4—£5 10s. per ton and upwards, according to grade.
 Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carboic.—Crystals, 6½d. 7d. per lb. Crude 60's, 1s. 8d.—1s. 9½d. per gal.
 Acid Cresylic, 99/100.—2s. 4½d. per gal. Steady. 97/99.—2s.—2s. 2d. per gal. Pale, 95%, 1s. 10d.—2s. 2d. per gal. Dark, 1s. 9d.—2s. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 1s. 2½d.—1s. 3½d. per gal., ex works in tank wagons; Standard motor. 1s. 9d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s. 1d.—2s. 5d. per gal., ex works in tank wagons.
 Toluene.—90%, 1s. 1½d. to 2s. 2½d. per gal. Firm. Pure, 2s. 3d.—2s. 5½d. per gal.
 Xylol.—2s. 1d.—2s. 6d. per gal. Pure, 3s. per gal.
 Creosote.—Cresylic 20/24%—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9d.—9½d. per gal., according to quality. Solvent 90/160, 1s. 8d.—2s. 1d. per gal. Solvent 95/160, 1s. 8d.—1s. 9d. per gal. Solvent 90/190, 1s. 3½d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
 Naphthalene.—Crystals, £11 10s.—£13 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—77s. 6d.—95s. per ton, f.o.b. according to district. Nominal.
 Pyridine.—90/140.—9s. 6d.—13s. per gal. Nominal. 90/180—5s. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—8s. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.
 Acid Sulphanilic.—9d. per lb. 100% basis d/d.

Aniline Oil.—7d. per lb., naked at works.
 Aniline Salts.—7d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4d. per lb. Fair enquiry.
 m-Cresol 98/100%.—2s. 8½d. per lb. Only limited enquiry.
 p-Cresol 32/34° C.—2s. 8½d. per lb. Only limited enquiry.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—2s. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—8d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb. ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4½d.—2s. 6d. per lb. Firm and brisk.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots—1s. per oz.
 Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 4½d.—1s. 5d. per lb. Less 5%. Firmer.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallic, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. 1s. 4d.—1s. 5½d. per lb. Technical 11½d.—1s. per lb. Both in good demand.
 Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.
 Acid, Tartaric.—1s. 2d. per lb. Less 5%. Firm market.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb., Powder 1s. 3d. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—6s. 6d. per lb.
 Benzonnaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—12s. 3d.—14s. 3d. per lb. Bismuth Citrate.—9s. 3d.—11s. 3d. per lb. Bismuth Salicylate.—10s.—12s. per lb. Bismuth Subnitrate.—10s. 6d.—12s. 6d. per lb., all according to quantity. Bismuth Nitrate.—6s. 9d. per lb. Bismuth Oxide.—13s. 9d. per lb. Bismuth Subchloride.—11s. 9d. per lb. Bismuth Subgallate.—9s. 9d. per lb.
 Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 4d.—2s. 5d. per lb. Potassium.—1s. 11d.—2s. per lb. Sodium.—2s. 2d.—2d. 3d. per lb. All spot.

Calcium Lactate.—1s. 2½d.—1s. 3½d. per lb.

Chloral Hydrate.—3s. 2d.—3s. 5d. per lb., duty paid.

Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.

Creosote Carbonate.—6s. per lb.

Ether meth.—1s. 1d.—1s. 11½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—5s. per lb.

Hexamine.—2s. 4d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.).—1s. 5d. per gal. f.o.r. makers' works, naked.

Hydroquinone.—4s. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—22s. per cwt., 112 lb. lots.

Magnesium Carbonate.—Light Commercial £33 per ton net.

Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%, in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net. Synthetic, 10s. 6d.—12s. 6d. per lb., according to quantity; Liquid (95%), 12s. per lb. Detached cryst., 14s. 6d. per lb.

Mercurials.—Up to 1 cwt. lots—Red oxide, 7s.—7s. 1d. per lb., Levig. 6s. 6d.—6s. 7d. per lb.; Corrosive sublimate, Lump, 5s. 3d.—5s. 4d. per lb. Powder, 4s. 8d.—4s. 9d. per lb.; White precip., Lump, 5s. 5d.—5s. 6d. per lb., Powder, 5s. 6d.—5s. 7d. per lb., extra fine, 5s. 7d.—5s. 8d. per lb.; Calomel, 5s. 10d.—5s. 11d. per lb.; Yellow Oxide, 6s. 4d.—6s. 5d. per lb.; Persulph B.P.C., 5s. 7d.—5s. 8d. per lb.; Sulph. nig., 5s. 4d.—5s. 5d. per lb. Special prices for larger quantities.

Methyl Salicylate.—1s. 7d. per lb.

Methyl Sulphonal.—11s. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—3s. per lb.

Phenazone.—4s. 6d. per lb.

Phenolphthalein.—6s.—6s. 3d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 96s. per cwt., less 2½% for ton lots.

Potass. Citrate.—1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.O.R. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins.

Resorcin.—4s. per lb. spot.

Saccharin.—55s. per lb. Very limited enquiry.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—Pulv. 77s. 6d.—82s. 6d. per cwt. net, according to quantity. Crystals 5s. per cwt. extra.

Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal, 1s. 10d.—1s. 11d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.

Sulphonal.—7s. 6d. per lb.

Tartar Emetic B.P. cryst. or powder.—2s.—2s. 1d. per lb.

Thymol, Puriss.—11s. 3d.—12s. 6d. per lb., according to quantity. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.

Aubepine (ex Anethole).—10s. 3d. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 6d. per lb. Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.

Cinnamic Aldehyde.—Natural, 17s. 6d. per lb.

Coumarin.—10s. 9d. per lb.

Citronellol.—14s. 6d. per lb.

Citral.—9s. 6d. per lb.

Ethyl Cinnamate.—10s. per lb.

Ethyl Phthalate.—3s. per lb.

Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—19s. per lb. Geraniol.—6s. 6d.—10s. 6d. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Bois de Rose) 16s. per lb.—(ex Shui Oil) 12s. per lb. Linalyl Acetate.—(ex Bois de Rose) 18s. per lb.—(ex Shui Oil) 14s. 6d. per lb.

Methyl Anthranilate.—9s. per lb.

Methyl Benzoate.—4s. 6d. per lb.

Musk Ketone.—36s. per lb.

Musk Xylol.—8s. 6d. per lb.

Nerolin.—3s. 9d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—11s. per lb.

Rhodinol.—28s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 6d. per lb. Vanillin.—17s.—18s. 6d. per lb. Good demand.

ESSENTIAL OILS

Almond.—11s. 6d. per lb. Anise.—3s. 1d. per lb. Bergamot.—30s. per lb. Bourbon Geranium.—11s. 3d. per lb.

Camphor.—63s. 6d. per cwt. Cananga, Java, 22s. 6d. per lb.

Cassia, 80/85%.—8s. 9d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure—6s. per lb.

Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 20s. 9d. per lb. Lemon.—11s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb. Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 70s. per oz., Palma Rosa.—9s. 6d. per lb. Peppermint.—Wayne County, 10s. 3d. per lb. Japanese, 8s. 6d. per lb. Petitgrain.—8s. 3d. per lb. Sandalwood.—Mysore, 26s. per lb., Australian, 17s. 3d. per lb.

PATENT LIST

The Complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than May 21st. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on April 7th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Allis-Chalmers Manuf. Co. Crushers. 7213. Mar. 15. (U.S., 24.4.28.)

Arnot. Filters. 7386. Mar. 17.

Chappuis. Furnaces. 7454. Mar. 17. (Fr., 20.3.26.)

Hutchins. Production of lumps etc. of agglomerated material. 7106. Mar. 14.

I.-G. Farbenind. Preparation of emulsions. 7652. Mar. 19.

Jacobsen. Separation of solids from air etc. 7372. Mar. 17.
 Morris. Pulverising etc. apparatus. 7423. Mar. 17.
 Pyrene Co., Ltd. Low freezing-point solutions. 7074.
 Mar. 14. (U.S., 14.3.26.)
 Rice. Drying apparatus. 7071. Mar. 14.
 Salerni. Heating or cooling liquids, gases, etc. 7209.
 Mar. 15.

Spencer-Boncourt, Ltd., and Vaughan. Plant for recovering waste heat. 7094. Mar. 14.

Stevens. Apparatus for drying, heating, or cooling 7527.
 Mar. 18.

I.—Complete Specifications

30,636 (1925). Akt. Separator. Edge filters. (244,111.)
 31,122 (1925). Marks (Karrner Engineering Corp.). Treating hygroscopic materials. (267,215.)
 13,830 (1926). Exeelsior Feuerlöschergeräte A.-G. Producing fire-extinguishing foam. (254,285.)
 14,651 (1926). Godel. Separation and recovery of gases and vapours by solid absorbents. (267,369.)
 26,926 (1926). Schleifenbaum et Cie., and Irmer. Grinding or pulverising mills. (267,426.)
 31,130 (1926). Grueber Maschinenbau A.-G., and Pfeiffer. Ball or tube mills. (262,785.)
 *6899 (1927). I.-G. Farbenind. Manufacture of emulsions. (267,534.)
 *6966 (1927). I.-G. Farbenind. Production of catalysts. (267,554.)
 *7074 (1927). Pyrene Co., Ltd. Low freezing-point solutions. (267,561.)

II.—Applications

Anglo-Persian Oil Co., Beale, Coxon, and Dunstan. Treatment of liquid hydrocarbons. 7180. Mar. 15.
 Arnold (Standard Development Co.). Apparatus for cracking hydrocarbons. 7115. Mar. 14.
 Bowater. Manufacture of water gas. 7438. Mar. 17.
 Canning and Clark. Manufacture of coal gas. 7216. Mar. 15.
 Clark. Manufacture of gas. 7032. Mar. 14.
 Hansgirt and Stransky. Cracking hydrocarbon oils. 7474. Mar. 17. (Austria, 18.3.26.) Refining hydrocarbon oil distillates. 7475. Mar. 17. (Austria, 18.3.26.)
 Holzverkohlungs-Ind. A.-G. Fuel for internal-combustion engines. 7600. Mar. 19. (Ger., 20.7.26.)
 John. Extracting oil from coal etc. 7600. Mar. 18.
 Kousnetzoff and Mirlesse. Regeneration of lubricating oils. 7075. Mar. 14. (Fr., 7.4.26.)
 Lyne. Apparatus for gas manufacture. 7227. Mar. 15.
 Menell. Retort for distilling solid fuels etc. 7487. Mar. 17.
 Mond (Metallbank und Metallurgische Ges.). Producing rich gas and semi-coke. 7214. Mar. 15.
 Oliver. 7003. *See* XII.
 Salerni. Heat treatment of carbonaceous etc. materials. 7205. Mar. 15. Gas-scrubbers etc. 7245. Mar. 15.
 Distillation of carbonaceous materials. 7353 and 7370.
 Mar. 16. Manufacture of briquettes. 7455. Mar. 17.
 Schroter. Dewatering peat. 7586. Mar. 18.
 Wade (Silica Gel Corp.). Refining liquid hydrocarbons. 7117. Mar. 14.
 Wegelin. Production of active charcoal. 7212. Mar. 15.

II.—Complete Specifications

24,747 (1925). Evans, and Wakefield & Co., Ltd. Oils and the treatment thereof. (267,174.)
 28,329 (1925). Donnelly. Conversion of heavy or complex hydrocarbon oils into lighter oils. (243,339.)
 31,572 3 (1925). Naugle. Treating carbonaceous material. (267,240 -1.)
 12,072 (1926). I.-G. Farbenind. Manufacture of liquid fuels. (252,019.)
 13,524 (1926). Henry. Ionising-retort. (267,358.)

13,895 (1926). I.-G. Farbenind. Obtaining light oils by washing gases. (254,287.)

13,973 (1926). Todd and Sumpf. Conversion of mineral oils etc. of high b.p. into aliphatic hydrocarbons of low b.p. (267,364.)

18,530 (1926). Haddan (Gulf Refining Co.). Production of lower-boiling distillates from higher-boiling petroleum hydrocarbons. (267,386.)

32,325 (1926). Stettiner (Hamotte-Fabrik. Coking or carbonising ovens. (263,801.)

*6297 (1927). Kohlenveredlung A.-G. Producing gas. (267,505.)

*6409 (1927). Soc. Internat. Des Proc. Prudhomme-Houdry Plant for the manufacture of synthetic liquid fuels. (267,512.)

*6700 (1927). I.-G. Farbenind. Manufacture of hydrogen (267,535.)

III.—Application

Wade (Silica Gel Corp.). 7117. *See* II.

III. Complete Specification

13,525 (1926). Henry. Manufacturing benzol and like aromatic hydrocarbons. (267,359.)

IV.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of copper compounds of substantive azo compounds. 7570. Mar. 18.

I.-G. Farbenind. Metallic compounds of *o*-hydroxyazo dyestuffs. 7439. Mar. 17. (Ger., 31.3.26.) Production of vat dyestuffs. 7440. Mar. 17. (Ger., 8.10.26.)

Johnson (I.-G. Farbenind.). Production of vat dyestuffs. 7062. Mar. 14. Production of derivatives of N-dihydro-1:2:1'-2' anthraquinonazine fast to chlorine. 7562. Mar. 18.

Scottish Dyes, Ltd., Anderson, Thomas, and Thomson. Production of dyestuff intermediates. 7583. Mar. 18.

Standfast Dyers & Printers, Ltd., Jones, and Kilby. Dyes and dyeing. 7235. Mar. 15.

IV.—Complete Specifications

25,438 (1925). Imray (Soc. Chem. Ind. in Basle.). Manufacture of vat dyestuffs and intermediates. (267,177.)

11,084 (1926). I.-G. Farbenind. Manufacture of condensation products containing sulphur. (252,694.)

14,256 (1926). Carpmael (I.-G. Farbenind.). Manufacture of oxycarboxy-*p*-diammodiarylsulphones and of oxycarboxy-*p*-aminooxydiarylsulphones. (267,366.)

16,244 (1926). I.-G. Farbenind. Manufacture of tetrahalogen-4:4'-dimethylthioindigos. (254,340.)

16,674 (1926). I.-G. Farbenind. Manufacture of hexa-substituted thioindigos. (254,743.)

V.—Applications

Dreaper. Viscose solutions etc. 7640. Mar. 19.

Gminder. Obtaining fibrous material from stalks. 7485. Mar. 17.

Heymann. Artificial silk. 7238. Mar. 15.

I.-G. Farbenind. Treatment of fibres etc. 7060. Mar. 14. (Ger., 18.3.26.)

Pringsheim. Depolymerising acetyl cellulose. 7199. Mar. 15. (Ger., 15.3.26.)

V.—Complete Specifications

31,409 (1925) and 18,013 (1926). Walker. Manufacture of cellulose. (267,226.)

*31,731 (1926). Gminder. Fibres. (267,470.)

*6711 (1927). Soc. Anon. Appareils et Evaporateurs Kestner. Recovery of caustic soda from residual lyes after manufacture of artificial silk. (267,536.)

*7199 (1927). Pringsheim. Depolymerising acetyl cellulose. (267,569.)

VI.—Applications

Adolph and Pietzsch. Bleaching. 7076. Mar. 14. (Ger., 29.3.26.)

Durand et Huguenin Soc. Anon. Products for dyeing etc. textile fibres etc. 7458. Mar. 17. (Ger., 17.3.26.)

Johnson (I.-G. Farbenind.). Production of fast yellow dyeings etc. 7563. Mar. 18.

King. Dressing textiles. 7124. Mar. 14.

Standfast Dyers & Printers, Ltd., Jones, and Kilby. 7235. See IV.

VII.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of complex bodies containing mercury. 7339. Mar. 16. Manufacture of complex metallic etc. compounds. 7470. Mar. 17. Manufacture of phospho-tungsto-molybdenum compounds etc. 7496. Mar. 17.

Dalozé. Manufacture of lead carbonate. 7661. Mar. 19. (Fr., 3.7.26.)

Holzverarbeitungs-Ind. A.-G. 7541. See XX.

Krebbs. 7072. See XI.

Mulliez Frères et Cie. 7657. See IX.

VII.—Complete Specifications

28,509 (1925). Waring, and Assoc. Lead Manuf., Ltd. Manufacture of lead oxide. (267,191.)

31,008 (1925). Cederberg. Apparatus for catalytic combustion of mixtures of ammonia and oxygen. (244,134.)

31,328 (1925). Cochrane Corp. See XXIII.

31,901 (1925). Johnson (I.-G. Farbenind.). Recovery of sulphur. (267,246.)

14,274 (1926). Roessler & Hasslacher Chem. Co. Manufacture of sodium peroxide. (265,124.)

27,946 (1926). Allegem. Ges. f. Chem. Ind. Eliminating water from liquid sulphurous acid. (261,732.)

*5610 (1927). Lederer, Stanczak, and Kassler. Precipitating metal hydroxides free from iron. (267,491.)

*6477 (1927). Kyber. See X.

*6700 (1927). I.-G. Farbenind. See II.

*6711 (1927). Soc. Anon. Appareils et Evaporateurs Kestner. See V.

*6996 (1927). Merck & Co. Iodine compositions. (267,557.)

*7072 (1927). Krebs. See XI.

VIII.—Complete Specifications

29,606 (1926). Brit. Thomson Houston Co., Ltd. Moulding silica. (262,110.)

1845 (1927). Brit. Thomson Houston Co., Ltd. Treating silica articles. (264,863.)

IX.—Applications

Asphalt Cold Mix., Ltd., Gabriel, and Levy. Bituminous emulsions. 7471. Mar. 17.

Gardiner. Preservation of timber. 7644. Mar. 19.

Kahl, and Rutgerswerke A.-G. Production of labile bitumen emulsions. 7598. Mar. 18. (Ger., 13.8.26.)

Mulliez Frères et Cie. Manufacture of lime or cement products etc. 7657. Mar. 19. (Fr., 20.3.26.)

Scheidhauer & Giessing A.-G., and Ackermann. Manufacture of bricks. 7393—4. Mar. 17. (Ger., 17.3.26.)

IX.—Complete Specifications

31,184 (1925). Spuckman. Making hydraulic cement. (244,756.)

20,029 (1926). I.-G. Farbenind. Manufacture of acidproof cementing-compositions. (267,396.)

*6477 (1927). Kyber. See X.

X.—Applications

Bradbury & Hall. Aluminium alloy. 7429. Mar. 17.

Cole. Protecting iron from rust. 7681. Mar. 19.

Cörsalli. Melting metals. 7665. Mar. 19. (Ger., 19.3.26.)

General Motors Corp. Electrolytic deposition of chromium. 7594. Mar. 18. (U.S., 30.6.26.)

Kelly. Alloys. 7411. Mar. 17.

Krupp A.-G. Non-magnetic cast iron. 7535. Mar. 18. (Ger., 9.7.26.) Sintered hard metal alloys etc. 7536 and 7542. Mar. 18. (Ger., 25.10.26.)

Oberhoffer and Piwowarsky. Production of high-grade iron etc. 7315 and 7327. Mar. 16. (Ger., 18.3.26 and 15.7.26.) Production of alloys. 7532. Mar. 18. (Ger., 18.3.26.)

Twynam. Recovery of tin from scrap etc. 7388. Mar. 17.

X.—Complete Specifications

27,887 and 27,922 (1925). Rheinische Metallwaren- und Maschinenfabrik. Case-hardening of steel articles. (242,978 and 244,431.)

32,934 (1925). Automatic & Electric Furnaces, Ltd., and Wild. Heat-treatment of iron and steel. (267,253.)

1732 (1926). Guertler. Silver alloys. (267,263.)

20,777 (1926). Metals Protection Corp. Chromium plating. (267,080.)

23,510 (1926). Mitchell. Extrusion of metals. (267,412.)

28,338 (1926). Carpmæl (I.-G. Farbenind.). Treatment of minerals, slags, or the like. (267,433.)

*6477 (1927). Kyber. Manufacture of iron phosphide and fused cement. (267,518.)

*6740 (1927). Michelsen. Conversion of slags. (267,539.)

*6842 (1927). I.-G. Farbenind. Decomposing titanium ores. (267,547.)

XI.—Applications

Burlison and Dereham. Galvanic batteries. 7056—7. Mar. 14.

Comp. Lorraine de Charbons, Lampes, et App. Electriques. Manufacture of electric cell carbons. 7452. Mar. 17. (Fr., 16.2.27.)

Cornish. Electrolyte for rectifying alternating electric current. 7409. Mar. 17.

General Motors Corp. 7594. See X.

Krebs. Apparatus for electrolysing solutions of alkali chlorides. 7072. Mar. 14. (Ger., 15.3.26.)

Pechkranz. Electrolyser diaphragms. 7311. Mar. 16. (Switz., 14.5.26.)

XI.—Complete Specifications

30,845 (1925). Leitner. Electric accumulators. (267,205.)

20,605 (1926). Weissmann. Electric cells. (262,049.)

*7072 (1927). Krebs. Apparatus for electrolysing solutions of alkali chlorides. (267,560.)

XII.—Application

Oliver. Manufacture of concentrated emulsions of oil and water. 7003. Mar. 14.

XII.—Complete Specification

24,747 (1925). Evans, and Wakefield & Co., Ltd. See II.

XIII.—Applications

Alecock, Weber, and Laporte, Ltd. Titanium pigments. 7181. Mar. 15.

King and Threlfall. Materials for forming impregnating-agents etc. 7198. Mar. 15.

Sichel Kommandit-Ges. Manufacture of colour-binding means. 7217. Mar. 15. (Ger., 10.5.26.)

Trist. Composition for inking printing-rollers. 7685. Mar. 19.

XIII.—Complete Specifications

28,509 (1925). Waring, and Assoc. Lead Manuf., Ltd. See VII.

30,881 (1925). Whatmough. Manufacture of lake colours or pigments. (267,207.)

XIV.—Applications

Anode Rubber Co., Ltd. (Klein). Production of caoutchouc. 7341. Mar. 16.

Anode Rubber Co., Ltd. (Klein, Gábor, and Szegvári). Production of coherent caoutchouc etc. products. 7330. Mar. 16.

Carlsson. Regeneration of vulcanised rubber. 7248. Mar. 15.

Fessel. Manufacture of rubber. 7450. Mar. 17.

XVI.—Complete Specification

30,832 (1925). Owen. See XIX.

XVII.—Complete Specifications

31,505 (1925). Morgan. Extraction of juice from sugar cane. (267,234.)

31,575 (1925). Naugle. Refining raw sugar melts etc. (267,242.)

XVIII.—Application

Commercial Solvents Corp. Butyl-acetonic fermentation process. 7111. Mar. 14. (U.S., 3,426.)

XIX.—Application

Beus and Veen. Preserving food. 7037. Mar. 14.

XIX.—Complete Specifications

22,214 (1925). Matzka. Preserving fruit juices etc. (267,058.)

30,832 (1925). Owen. Dehydrating vegetable substances or organic products. (267,203.)

31,492 (1925). Kohman. Manufacture of bread. (244,480.)

22,983 (1926). Iscovesco and Adams. Vitamine-rich products. (267,410.)

XX.—Applications

Burgess and Morgan. Tellurium compounds for therapeutic etc. purposes. 7030. Mar. 14.

Commercial Solvents Corp. 7111. See XVIII.

Holzverkohlungs-Ind. A.-G. Concentrating volatile aliphatic acids. 7541. Mar. 18. (Ger., 17,526.)

I.-G. Farbenind. Production of aldehydes. 7061. Mar. 14. (Ger., 19,326.) Manufacture of condensation products. 7322. Mar. 16. (Ger., 16,326.)

Rupe. Manufacture of unsaturated aldehydes. 7460. Mar. 17. (Switz., 22,326.)

XX.—Complete Specifications

22,355 (1925). Carpmæl (Bayer & Co.). Manufacture of pharmaceutical products. (267,169.)

6167 (1927). Carpmæl (Bayer & Co.). Manufacture of quinoline derivatives. (267,457.)

*16,060 (1926). Eckermann. Decreasing the toxic action of cocaines. (267,463.)

XXI.—Application

Tarbin. Colour photography. 7489. Mar. 17. (Ger., 1,227.)

XXII.—Application

Luis. Explosives. 7573. Mar. 18.

XXIII.—Application

Du Pont de Nemours & Co. Disinfectants. 7595. Mar. 18. (U.S., 18,326.)

XXIII.—Complete Specifications

31,328 (1925). Cochran Corp. Production of base-exchange substances. (245,092.)

8916 (1926). A.-G. f. Stickstoffdünger. Purifying boiler feed-water. (250,574.)

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Argentina*: Paper (B.X. 3322). *Belgium*: Pig iron (291); steel castings, rolled steel (292); pharmaceutical goods (293). *Brazil*: Tinplate, galvanised iron sheets, iron and steel (320). *British India*: Tinplate (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Bulgaria*: Rubber, tinplate, iron, metallurgical coke (297). *Canada*: Quartz mining supplies (286). *France*: Soaps (299).

New Zealand: Cast iron (287). *Northern Ireland*: Artificial silk yarns (288). *Poland*: Tin, nickel, copper, mercury (316). *South Africa*: Leather belting, impregnated rubber belting (B.X. 3355). *Turkey*: Gas and oil engines, pumps, indiarubber goods, refrigerating machinery (317). *United States*: Colloidal clay, high-grade china clay, ball clay (B.X. 3347).

Milan Sample Fair

The eighth Milan Sample Fair will be open from April 12 to 27. About 6000 exhibitors are showing, the total area taken being 300,000 sq. metres. Fourteen of the most important nations have erected permanent pavilions.

News from Advertisements

A chemical engineer, experienced in the production of acetate silk, is wanted for abroad (p. viii).

A mineral analyst with British, Colonial and Chinese experience of buying ores desires responsible appointment (p. viii).

An artistic bungalow is offered for sale (p. viii).

EDITORIAL

The Oil and Colour Chemists

WE have become so accustomed to pleasant company and good cheer when the members of the chemical fraternity dine together that we have high expectations when a further dinner is held. Indeed, it might well be claimed that chemists were facultative Frothblowers long before that august body had been thought of. The dinner of the Oil and Colour Chemists was no exception amongst our pleasant memories, and we were once more blessed in that our expectations were not disappointed. There were some good speeches, there was music of a discrete, carminative kind, and the ailments were provided by the Hotel Cecil. There were one or two features which were peculiar to the evening. Sir Frank Heath, who, as our readers are aware, is severing his connexion with the Department of Scientific and Industrial Research, announced, in the course of an interesting speech, that the occasion was the last on which he would speak as the representative of the Department. The splendid work which Sir Frank Heath has done and his powers as an organiser and as an administrator are demonstrated by the Department itself. No words of ours could add anything to his reputation or to the gratitude which he has earned equally from science and from industry. The Society of Chemical Industry was, as one would expect, well represented, as the President, Mr. F. H. Carr, C.B.E., and two Past-Presidents, Dr. E. F. Armstrong, F.R.S., and Mr. W. J. U. Woolecock, C.B.E., were present as guests of the Association. Mr. Carr, in his speech, referred to the new Research Association of British Paint, Colour and Varnish Manufacturers, and pleaded earnestly for the long view to be taken in planning out the research programme, for fundamental researches, which alone could ensure the future and steady progress of industry. Dr. Armstrong paid a well-deserved tribute to the President of the Association, Mr. C. A. Klein, and in a punning allusion, said there was nothing small about him except his name. Prof. H. E. Armstrong, who was also a guest, spoke by special invitation of the President, and sang the praises of linseed oil and white lead for outside work. Previously in the evening his distin-

guished son, Dr. E. F. Armstrong, had sung the song of cellulose lacquers, although in not so definite a major mode, and had pointed out that nobody has yet discovered what linseed oil really is. We were completely puzzled by these remarks, and the pleasure of our evening, otherwise delightful and interesting, was threatened by "a depression over Iceland" which arose from our inability to provide a solution.

Spectrum Analysis

Mr. Twyman's paper on "Metallurgical spectrum analysis" is published at a time when our attention has been otherwise directed to optical research and achievements. The Newton celebrations have reminded the whole nation of the life of a man who made important discoveries in mathematics and astronomy, almost founded the science of optics, took an intelligent interest in chemistry, philosophy and religion, and reformed our coinage. As Mr. Twyman points out, Newton's discovery of the dispersion of light was the first step towards spectrum analysis; other steps were taken in this country by that singular man Wollaston, by Brewster and Talbot, and more recently by Fowler, all of whom have made notable advances in this science. Mr. Twyman is acknowledged as an expert on the subject, and his paper, read before the Birmingham and Midland Section a month ago, is an admirable account of the use of this method of analysis as a speedy method of detecting and estimating the impurities and components of alloys. The division of spectra into flame spectra, arc spectra, spark spectra, and so on is convenient in practice: theoretical investigations indicate that it is the outer electrons which have most to do with the production of spectra, that the flame and arc spectra are produced by the normal atom, that the spark spectrum is produced by atoms which have been deprived of one electron, and that other anomalous spectra can be emitted in suitable circumstances by atoms which have lost two or even three electrons. Within our recollection the study of spectrum analysis has made astonishing progress. It must be thirty years or more since Sir William Ramsay delighted us by showing us in his laboratory the recently

discovered spectrum of helium; since then the spectra of a few of the simpler elements have been resolved into the well-known series of Lyman, Balmer, Paschen, and Brackett, or the modifications of one or more of these suggested by Rydberg, Hicks and others. The practical side of spectrum analysis has hardly made so much progress as the theoretical side; Mr. Twyman's paper shows us how the practical side should be developed and can be developed.

The American Petroleum Industry

Petroleum production in the United States is steadily increasing every year, and notwithstanding the fact that some prophets thought that 1923 would prove the peak year of production, after which a decline would be noticeable, we find that, during 1926, three further important and highly productive new fields have been found in Smackover, Panhandle and Semmore. Quite a number of other small pools have also been found, with the result that not only was the high production of previous years maintained, but a record achievement in production of about 770,000,000 barrels has been realised. Other countries have also increased their production considerably, including Rumania and Russia, and in view of such high production in America, Prof. Ise's recently published book on the United States oil policy is of particular interest. The book itself is reviewed in another column, and one cannot help but agree with Prof. Ise's long-sighted view, that the profligate use or misuse of such a valuable product as petroleum should be deprecated. One, however, wonders whether sacrifices which we may make in our generation for generations to come may not after all retard progress considerably. Are we properly grateful to past generations for not having used up all the tallow in their candles to provide us with enough to light our way? or should we be accused of profligacy for not using candles for lighting to-day and using up valuable natural resources such as either coal or oil which are being used for the manufacture of electric light? Prof. Ise is of opinion that, as the United States has supplied the whole world with oil, they may find themselves in a difficult position later on, when perhaps they may have to go abroad for oil. Would it be so very dreadful if we suggested that in a generation or two oil itself may be placed in the same category as we now place the tallow candle of a generation or two ago? And supposing the United States should have to go abroad for its oil? Would not the United States, whose great prosperity is being accepted as a matter of course, be always in the position of being able to get what she wants when it comes to a question of competitive buying? Would she not be even then in a better position than the rest of the impoverished world? Prof. Ise suggests that the United States should have an equal share with other countries, perhaps more particularly with England and France, of any oil to be found elsewhere, and suggests that the United States Government should press for recognition of such a claim; but is the United States Government prepared to pay, both in life and treasure, for the protection and retention of potential fields found in other countries? This question of "the open door"

does not somehow coincide with their own "Monroe Doctrine," and we do not think that Government pressure or Government interference will be of great assistance to trade. American business men are as capable of taking care of themselves abroad as they are in their own country, and seeing the vast capitalistic resources which they control, Prof. Ise can quite safely leave it to them to see that future generations are not left in want. There is, however, another aspect, and that is, just as the last decade or two in the last century and the first quarter of the present century has seen such great scientific progress, so it may well be assumed that science will advance with as rapid strides during the next half century, and that fifty years hence we may regard oil as a very obsolete fuel, whether cheap or otherwise.

Applied Research

Dr. H. Moore, in his address to the British Non-ferrous Metals Research Association, deals with many subjects, including that ever-present one, the mating of pure science with utilitarian demands. We think his address is well worth study: with the greater part of it almost everyone must agree. It seems hard to believe that in metallurgy or chemistry anyone will now consider that research in applied science is inferior to research in pure science, but it is wise to give due emphasis to the point as Dr. Moore does. His advice on the procedure of applied research will, we think, be useful. We are sorry to read the advice that all information, whatever its source, should be examined critically, and that serious errors are to be found in scientific papers published in the most reputable periodicals, while text-books are almost notorious in this respect. We are sorry to read this because, although we have ourselves on sundry occasions encountered statements in reputable periodicals and text-books which we were unable to believe, we attributed this mainly to our own lack of faith, and it is disturbing to find that really competent judges, for instance, directors of research, also find it difficult to believe statements which you may find in many of those scientific treatises, without which no gentleman's library is complete. If you are buying a horse in Yorkshire, a lead-mine in Wales, or an overcoat in Houndsditch, you may disregard nine-tenths of what the vendor has to say: the remaining tenth will be found to be untrue. With due modification of the proportions, and excepting statements appearing in this JOURNAL, and those made by our own particular friends, we should advise those who undertake research on scores of simple problems we have heard of to adopt the same mental attitude; by all means read something of what is supposed to be known about the problem, but do not assume that a process is possible because it is described or is impossible because it conflicts with the views of every sane man. Ramsay would never have discovered helium or Mme. Curie radium had they not been unwilling to believe what everyone else did believe. And if the truth were known, it may well be that Perkin was told in his early days that his proposed method of making quinine was no good and would turn out to be a waste of time.

METALLURGICAL SPECTRUM ANALYSIS

By F. TWYMAN, F.R.S.

(Continued)

Solids, including powders.—The specimens for sparking are held in clips in an adjustable holder. This holder suffices for metals, alloys or conducting minerals. If the specimens consist of non-conducting powders (such as those of slags, precious stones, stony minerals, glasses, precipitates or residues from solutions), there should be added a small cup of platinum about 20 mm. diameter and 5 mm. deep, held in the lower clamp by a wire of the same metal, the cup being heated in the flame of a Meker burner. A stout platinum wire leads the spark from the upper clamp to the platinum cup, in which the powder or powdered mineral is mixed and fused with about four times its weight of sodium or lithium carbonate—these salts being chosen because of the simplicity of their spectra.

Liquids.—If the samples are in the form of solutions, the sparking tubes of Hartley or of Pollok may be

The set of photographs develops up like that shown in Fig. 4, in which the top spectrum is of tin supposed to be pure, the middle is a commercial tin under examination, and the bottom is of lead, the metal whose presence or absence is in question. It will be seen by the presence of the sensitive lines of wavelengths 2614, 2663, 2803 and 2833, not only that the commercial tin contains some lead, but also, as shown by line 2833, that a trace of lead is present in the supposedly pure metal. It is not, of course, necessary to adopt this precise arrangement of spectra, but it is one that is very frequently convenient.

If examinations for the presence of other metals require to be made on the same sample or if other samples are to be tested, the same plate can be used by racking the dark slide to a fresh position, and as many as six strips (that is, eighteen spectra in all), will easily go on a single plate.

In this way, and in other ways which I will not stop to describe, the entire metallic constituents in an alloy, mineral, ash, or whatnot, can be readily and quickly identified.

FIG. 4.

adopted (see "Wavelength Tables for Spectrum Analysis," by F. Twyman, Adam Hilger, Ltd.).

So much for how the sample is made to emit the light. Next I will describe very briefly the means of identifying the lines of the various elements.

COMPARISON SPECTRA

Here is a photograph (Fig. 4) in which the spectra of several samples are shown close together. These spectra are taken one after the other on the same plate without any readjustment of the spectrograph. If there are any constituents common to two or more of the samples the spectrum lines of those constituents will appear in the corresponding spectra. Spectra so arranged are called "comparison spectra."

To ascertain whether a substance contains a specified metal—Three spectra are taken, of which the first is that of any metal which is known to be present in considerable quantity, or if none such be known then one of the purest iron obtainable; the second that of the sample under test; while the third is that of the metal whose presence or absence is to be determined.

PART II.—QUANTITATIVE SPECTRUM ANALYSIS

Variation of intensity with content

We have seen how Hartley, with his co-workers, endeavoured to found a quantitative method of spectrum analysis on the observation of the amount of dilution to which a solution could be submitted before the disappearance of certain distinctive lines which he called "persistent" lines. The method has the disadvantage that a solution must be made up and the avoidance of the making-up of solutions is among the advantages of spectrum analysis.

Of recent years, therefore, attempts have been made in the laboratory of Adam Hilger, Ltd., and elsewhere, to found a method of quantitative analysis on observations of the varying intensities of the spectrum lines with the proportion of the corresponding ingredients. It is true attempts of the kind were made many years ago, and were not very successful. Recent attempts, however, have been more so.

If we take any range of percentages of particular impurities in a particular metal we shall find that there are certain lines which do not alter much in intensity, whilst

there are usually other lines which alter rapidly in intensity. Obviously, in attempting a quantitative determination of a substance which is present in approximately say, 10%, we should utilise for our observations not the lines which do not alter in intensity round about that percentage, but those which do. These are not generally the persistent lines or "raies sensibles" and, since there has been no large accumulation of data relative to these variable lines of a character similar to that accumulated by Hartley, de Gramont, and so forth for the persistent lines, each observer will usually, for the time being, find it necessary to accumulate the data for himself. A certain amount of such information has been collected in the laboratory of Adam Hilger, Ltd., and I will now give a brief account of some of the examples of quantitative analysis the routine of which has been worked out.

The instrument used by us is the quartz spectrograph, usually the size shown in Fig. 2. Either the arc or spark spectrum is used for this work, and in most cases the arc method is both simpler to use and more sensitive in detection.

A convenient form of arc is obtained by using two electrodes of the metal under examination, and maintaining an arc about $\frac{1}{16}$ in. in length by a current of about 3 amps. This can be obtained, using a D.C. supply of 220 volts and placing in series with the arc a lamp resistance having three or four 50-c p. carbon filament lamps in parallel. It is preferable to have both electrodes of the same material, as in that case no impurities except those in the material are introduced. If only one piece of a sample of metal is available, such as copper, it is advisable to use the sample as positive electrode and a rod of the purest copper obtainable as negative electrode. In the same way for analysing steel samples the negative electrode would be pure iron. This method has the disadvantage that the intensities of the impurity lines are less than would be the case if both electrodes were of the same material.

In the case of the spark, using an A.C. supply of 150 volts and transformer as described above, a satisfactory spark will be obtained (about $\frac{1}{16}$ in. in length) by placing 4 lamps in the lamp board, and thus is the procedure which has been regularly adopted.

The most suitable shape of spark electrodes is wedge-shaped, so that they can be mounted in the holders with the edges of the wedge parallel to, and in line with the axis of the collimator. This arrangement gives a steady image on the slit. Whatever the shape of the electrodes, however, it is advisable to mount them in the holders, so that the discharge takes place either in this manner, or from two points, so as to obtain an image on the slit which does not wander.

Where the sensitive lines used in analysis lie towards the ultraviolet end of the spectrum the ordinary condensed spark generally proves satisfactory, but when the lines occur towards the visible part of the spectrum trouble arises from the "air lines" (lines due to oxygen and nitrogen) which may mask the lines of the material, especially if these are faint. To remove these air lines from the spectrum a self-induction coil is placed in series with the spark.

This method of quantitative spectrographic analysis

is based on the appearance and variation of intensity of selected lines in the spectra of standard samples. As the percentage of impurity increases, other lines than the sensitive lines of de Gramont begin to appear, these lines showing an increase in intensity as the amount of impurity increases. These lines are readily identified by photographing a comparison spectrum of the impurity itself. It has been found, as explained above, that the actual "raie ultime," or "raie sensible," which appears when only traces of the impurity are present, is not always the best line to use in quantitative work. Any lines which appear with certain percentages of the impurity, and show a systematic variation of intensity can be used, and those are best which vary most rapidly with variation of percentage.

In the preparation of standard alloys containing definite percentages of each metal, the Ajax-Northrup induction furnace is recommended by the Bureau of Standards (B.S. Sci. Paper No. 444. "Practical Spectrographic Analysis"—Meggers, Kiess and Stinson.) Homogeneity of the alloys and minimum loss from volatilisation and freedom from contamination are then ensured. The purity of the metals used in the preparation of these synthetic alloys can, of course, be checked by spectrographic methods.

Having standard samples whose impurity contents are accurately known, their arc spectra are photographed in juxtaposition on a Hilger medium quartz spectrograph E3. The wavelength scale (which is photographed directly on to the plate) facilitates the identification of the sensitive lines in the spectra: but to make the identification still easier, a further spectrum can be photographed, namely, that of a sample of the metal for which estimations are to be carried out. In the various spectra these sensitive lines will decrease in intensity as the percentage of impurity is decreased, and in some cases will disappear. Hence, using these spectra as standards, spectra of any samples of a like composition can be compared with them and estimations made within the range of the standard samples. It sometimes happens that a sensitive line due to the impurity occurs fairly close to a line of the metal containing that impurity. In this case the estimation is considerably simplified, as the line due to the main bulk of the metal serves as an intensity standard, and any errors which may arise from differences in exposures and developing are eliminated.

This procedure has been clearly pointed out by W. Gerlach; it is identical with that used in the laboratories of Adam Hilger, Ltd., wherever possible.

Two lines of the impurity are not compared with one another, but one (or more) lines of the impurity B with one (or more) neighbouring lines of the substance containing it, as far as possible equal in intensity. A single ideal case will serve to illustrate this. Near a spectrum line λB of the impurity B occur three lines of the main substance A, $\lambda_1 A$, $\lambda_2 A$, and $\lambda_3 A$. Adopting these three lines as standards one finds that the intensity of the λB line

At 0.1% B is equal to $\lambda_1 A$
 „ 0.2% B „ $\lambda_2 A$
 „ 0.05% „ $\lambda_3 A$

Then in the analysis of the substance $A + x\% B$ the

quantity x is determined from the brightness of the B line relative to $A_1 A_2 A_3$. This method is already well developed, and gives results whose accuracy increases as the range between the standards decreases. Also it is independent of photographic effects."*

As a result of spectrographic investigations which have been carried out in the Hilger laboratories with various metals, it may be stated that one can distinguish between 0.001%, 0.01%, 0.1% and 1.0% of any metallic impurity by such comparisons of the intensities of the lines; while in favourable cases a very much higher accuracy is attained. The estimation is, of course, very rapid—one half hour will suffice for the whole procedure of photography, developing, and estimation; and the plate forms a permanent record of the whole metallic contents of a sample.

The tables of de Gramont are useful whether the arc or spark be used, since the lines which are persistent in the spectrum of the spark are persistent also in that of the arc. At the same time it should be observed that where one is dealing with a small quantity of metal of high melting point (such as iron or nickel) in a metal of low melting point (such as copper or aluminium) the arc is not so sensitive as a means of detection of impurity, the reason probably being that there is an insufficient quantity of the vapour volatilised in the arc, the temperature of which is low as a result of the low boiling point of the main bulk of the metal.

Specific Examples

Impurities in copper Bismuth is one of the most injurious elements that can be present in copper. It induces extreme brittleness in the copper, so much that not more than 0.005% of bismuth can be tolerated. According to W. Stahl (*Metall. u. Erz.*, 1925, **22**, pp. 421

2) as little as 0.02% Bi in copper renders copper hot-short, while 0.1% renders it cold-short, although the effect can be reduced to some extent by the addition of the requisite amount of antimony or arsenic. Bismuth occurs in the form of films between the copper crystals, and this is the reason of the brittleness.

Other impurities present in copper such as arsenic and iron seriously affect the electrical conductivity. Although the copper obtained by electrolytic refining is of exceedingly high purity, impurities are unavoidably introduced during subsequent remelting and casting.

When the amount of arsenic is small, it cannot be identified as a separate constituent under the microscope, but exists in what is called a solid solution. The consequence is in this particular case of arsenic in copper, that the mechanical properties of copper are not adversely affected until the amount of arsenic becomes considerable. On the other hand, the effect on the electrical conductivity is very great, because the presence of the arsenic atoms in the crystals themselves destroys the complete regularity of their structure and interferes with the passage of the electrons which carry the electric current." (Dr. Rosenhain, 5th Autumn Lecture to the Institute of Metals, September 1, 1926.)

The main difficulty in the chemical analysis of copper with respect to bismuth is that the method consists of

a very large number of manipulative processes, which necessarily reduce the chances of accuracy. The determination takes very considerable time, and in view of the small quantity which is usually present, and also in view of the fact that the methods are partly gravimetric, any great degree of accuracy is difficult to attain. In most instances it is desired to know rapidly what the percentage of bismuth in copper may be, so that rapid decisions regarding material can be reached, and the chemical methods are too tedious for this purpose to be achieved.

These chemical processes can be replaced by the comparatively simple spectrographic method, which is based on the intensity of the bismuth lines, wave-lengths

Fig. 5

3067.7 and 2898.0 Å, which appear in the arc spectra of copper samples containing bismuth.

The determination of calcium in magnesium. In the use of magnesium for light alloys it is customary to add calcium to retard the rapid oxidation of the molten surface during foundry operations. If much less than 0.1% be present, the calcium has but little of this desired effect, while if it is present in excess of 0.2% it is not only in excess of requirements but appears to be objectionable.

The accurate determination by chemical means of such small quantities of calcium is an extremely laborious process, and is also subject to uncertainty on account of the masking effect of the relatively large quantity of magnesium.

The quantitative spectrographic determination is, however, both rapid and reliable. A condensed spark

* Zur Frage der richtigen Ausführung und Deutung der Quantitativen Spektralanalyse, Zeits. f. anorg. und allg. Chemie. Band 142 Heft. 3 u. 4.

discharge is passed between two pieces of magnesium under test, a Hemsalech coil included in the circuit. Fig. 5 shows the increase in intensity of the calcium lines 3933.7, 3968.5 and 4226.7 Å as the percentage of calcium in the magnesium increases. This photograph was obtained on a Hulger E.3 spectrograph with 3 minutes' exposure for each spectrum.

The determination of aluminium in brass. Aluminium in brass increases the hardness of the material. Furthermore, brass containing aluminium is generally found difficult to forge. Beyond these facts, however, aluminium imparts a characteristically light colour to brass even when present in only small quantities, and this colour renders the brass unacceptable to many people.

Further examples of the quantitative spectrographic analysis of non-ferrous metals are given in "Practical Spectrographic Analysis" (Bureau of Standards Scientific Paper No. 444--Meggers, Kiess and Stimson); among them are:—

(a) *Analysis of tin used as fusible safety plugs for steamboat boilers*:—"The requirement that only minute quantities of the elements may be present in the metal used for plugs renders the chemical analysis difficult. When only small quantities of lead and zinc or bismuth and copper are present, they may both respond to the same chemical test for one of them, thus giving a wrong analysis. No such confusion is possible in the spectroscopic analysis, and from a study of the intensities of

FIG. 6.

The difficulty in connexion with the determination of aluminium in brass, by chemical methods, is that it is a long and tedious process entailing a number of operations, whereas the spectrographic method is comparatively rapid.

Spark spectra of tin-antimony alloys.—Two minutes' exposure of the condensed spark discharge between small pieces of tin-antimony alloy samples is given. The increase in intensity of the sensitive antimony lines as the amount present increases to 30% in stages of 5% is shown in Fig. 6.

Determination of small quantities of impurities in lead.—The bismuth line 3067.7 Å and the copper doublet 3247.5 and 3274.0 Å can be used for the quantitative determination of small quantities of these metals.

the raies ultimes and other sensitive lines in the spectrum it is possible to determine very closely the amount of each present in the alloy."

(b) *Analysis of gold.*—"Chemical analysis for the determination of base metals in gold bullion, must of necessity be done by wet methods most carefully carried out on very large amounts of metal when only minute traces of the base metal are involved."

(c) *Analysis of platinum.*—"It is well known that certain physical properties of metals are extremely sensitive to traces of impurities which are not readily detected by chemical methods. This is of exceptional importance in the case of platinum which finds such wide use in precision measurements of temperature."

Spectra of various alloys illustrating the method are

FIG. 7.

reproduced and a detailed account of the technique and mode of procedure is given.

(3) STEEL ANALYSIS

The determination of chromium and manganese.—In obtaining the photographs reproduced, one minute's exposure of the arc between steel samples was given in each case, using a violet glass spectrograph, E. 43.

It is difficult to maintain a steady arc between ferro-chromium electrodes (containing 69.5% Cr) and thus the series of spectra of chromium steels reproduced in Fig. 7 has been obtained by using the sample as the positive electrode and a pure iron rod as negative electrode. In using pure iron as one electrode care has to be taken not to allow a bead of molten iron to adhere to the sample under investigation, otherwise the spectrum will be that of practically pure iron.

In the case of the series of spectra of manganese steels (reproduced in Fig. 8), both electrodes were of the same

Fig. 9

sample, and greater variations in intensity were obtained in this way.

The lines of chromium and manganese which are found to be useful are as follows:

(a) Chromium. The group of lines 5208.4, 5206.1 and 5204.5 Å, shows an increase of intensity as the percentage of chromium increases, and it occurs in a region of the spectrum which is comparatively free from iron lines. These lines are given as sensitive lines by de Gramont.

(b) Manganese. The group of lines

4761	4754.1
4762.5	4783.5
4766.0	4823.6
4766.6	

gives the best variation of intensity with increasing percentage of manganese present in the steel. This group also occurs in a region of the spectrum comparatively free from iron lines. The lines 4823.6, 4783.5, and 4754.1 Å are given as sensitive lines in the spark spectrum by de Gramont, but the remaining lines are sensitive under these conditions to the same extent as the sensitive lines, although not classified as such.

The determination of carbon in steels.—Fig. 9 was obtained by photographing the spark spectra of carbon, and of ferro-manganese and ferro-chromium containing 6.84% and 5.54% carbon respectively. A distinct increase in intensity in the "raie ultime" 2478.6 Å of carbon is observed. A 5 minutes' exposure was given in each case, using the medium quartz spectrograph, E.3.

Some doubt has been expressed as to the utility of such spectrographic analysis of steels. There is no difficulty whatever in estimating manganese or chromium in steel by chemical methods with a high degree of accuracy and without doubt that the determination is correct. But the comparatively rough quantitative estimations by spectrogram are obtained with great rapidity, and information as to all the other metals present is given at the same time. The method is well adapted to the sorting out of steels and checking purposes.

A visual instrument has been designed for the purpose of rapidly estimating nickel and chromium in steels. This instrument enables the presence of nickel and of chromium in samples of steel (e.g., steel bars or steel scrap) to be detected immediately, even by an unskilled observer. Not only so, but a few days' experience with bars of known nickel or chromium content will enable the observer to state the approximate percentage present—as, for instance, 1%, 2%, or 4%.

The instrument has no adjustments, the observation of nickel and chromium respectively being provided for by two eye-pieces, in the one of which is seen the most distinctive nickel lines, and in the other the most distinctive chromium lines. These lines are seen and identified by a circle around each, and by their position in relation to the iron lines grouped immediately around them, and the instructions for use of the instrument contain a description whereby the observer unfamiliar with the spectrum may find the lines without difficulty.

The arc is struck by touching both rods simultaneously with a third rod of iron or carbon steel (insulated by pushing over one end of it a piece of ordinary rubber tube). Removal of this rod strikes the arc, and the observer at the spectroscope is able immediately to state whether or no the sample contains an important quantity of nickel or chromium. With the aid of three or four standard samples containing various percentages of nickel and chromium, he can soon accustom himself to state also the range of percentage within which the nickel or chromium content lies.

VISCOSE SILK CARTEL

According to a statement in the *Financial Times*, the Belgian artificial silk firm Tubize has reached an agreement with Courtaulds, Snia Viscosa and the Vereinigte Glanzstoff Factory Company, under which minimum prices will be fixed for sales to Germany, without, however, instituting a mutual commercial management. The Vereinigte Glanzstoff Company denies the reports that there have been discussions concerning the linking up of the Nederlandsche Kunst-Seide factory and the Glanzstoff-Bember group with the International Artsilk Convention.

THE NITROGEN INDUSTRY IN THE UNITED STATES

By H. WIGGLESWORTH

"The Atmospheric Nitrogen Industry," by Dr. Bruno Waeser, recently published in English from a translation made by Dr. E. Fylenman, Chief Chemist to J. F. Crowley & Partners, should attract unusual attention at this time, when the subject is so often referred to in connexion with commerce, agriculture and explosives.

Some responsibility for accuracy must fall on the author of such an important work, and it is to be regretted that many statements quoted must be due either to clerical errors or wholly false reports.

The writer of this article has been identified for over thirty years with the development of the American chemical industry, and cannot, therefore, refrain from commenting upon some of the misleading statements, more particularly those dealt with in Chapter XI, Part I, entitled "The development of the nitrogen industry in the U.S.A."

For example, on page 260, it is stated that in 1914 6,000,000 tons of chemicals were manufactured in the United States of the value of \$2,500,000. Does anyone know of any chemical product that can be mined or manufactured for 40 cents a ton? In 1917, it is stated that the tonnage was 46,000,000 tons of a value of \$57,000,000, or \$1.25 per ton, which is obviously preposterous.

On page 261 it is stated that potash fertiliser from Nebraska was sold in the United States at \$12.50 per ton. Where were such sales made? The freight alone from Nebraska to the consuming centres would almost amount to that figure.

On page 286 it is stated that the General Chemical Company acquired a considerable influence in the National Aniline & Chemical Company during the war, the latter company having been founded with German capital. This must surely be classed as a wild assumption, as the National Aniline & Chemical Company was built, and had for years been controlled by, the Schoellkopf family, the senior and head of which, as well as all his brothers, was born in America. Furthermore, it would have been seized by the Alien Property Custodian if it were even half-German.

It is further stated on this page: "In 1920 a formal amalgamation took place of the General Chemical Company, the Barrett Company, the Semet Solvay Chemical Company, and the National Aniline Company. The new company is said to have a capital of \$150,000,000." Is it then implied that the German influence continued?

Any financial house in Berlin, Frankfort, or other important German city would give the complete facts, and not the surmises that are quoted to guide the reader.

Page 282, with repetition in pages 300 and 485, states that the U.S.A. Government's nitrate plant No. 1 at Sheffield, Alabama, which was to have operated a Haber process, was a "complete failure." Quite contrary was the case.

The Haber process owned by the Badische Aniline & Soda Fabrik was developed on Haber's exposition

that the synthetic reaction equilibrium of ammonia made it uneconomic to attempt the manufacture of synthetic ammonia at pressures less than 200 atmospheres. Hoping to control this industry, they had successfully secured world-wide patents that allowed claims, giving them an apparent monopoly of pressures over 100 atmospheres.

The General Chemical Company, therefore, set out to determine whether pressures under 100 atmospheres could be employed economically, notwithstanding the Badische's contention. They had naturally followed closely the research dealing with combining nitrogen, and in 1912 had created a special laboratory for synthetic ammonia studies. By 1916 they had made such progress in the operation of a pilot unit that they concluded to appropriate about \$1,000,000 for a larger manufacturing unit, which was to be erected at one of their works in the vicinity of New York.

Before the apparatus had been delivered in 1917, by which time the United States had entered the World War, the Government solicited the privilege of erecting an ammonia unit of 10 tons daily capacity, to determine whether the process had reached a stage that would justify its adoption for war purposes. Subsequently two additional units were decided upon as the Government's confidence had grown while the working plans progressed.

The first unit was only just coming into operation at the time of the Armistice, and was not run for any length of time thereafter, as after many months' discussion it was found impossible to effect arrangements free from Government interference that would render success possible.

The No. 1 ammonia plant erected at Muscle Shoals was designed to operate at pressures below 100 atmospheres, and employed a catalyst never before used anywhere. It can hardly, therefore, be properly classified as a Haber process. Secondly, it did produce enough ammonia to satisfy the experts of its success. Only certain mechanical defects needed correction, and these the General Chemical Company undertook to carry out at their expense if given reasonable time to perfect the changes.

This is the explanation of the so-called "failure." The real facts, however, are that in the opinion of the experts of the General Chemical Company the process fully justified expectations, and this conclusion was accepted by their directors.

The Atmospheric Nitrogen Corporation was therefore formed in 1920 with the co-operation of the Solvay Process Company, as their broad interest in coke and ammonia was deemed of greater importance for future development than the selection of a site such as Muscle Shoals, where cheap power was the only factor.

As Director of Research and Development in the General Chemical Company until the end of 1921, and responsible for the success of the synthetic ammonia venture, I feel called upon to give the above facts, which are well known and easily verified.

The superb work of Mr. de Jahn and his assistants should be widely known. He has been the American pioneer in this field, and was responsible for the design and construction of the first plant built in America at

Syracuse. Never has a chemical plant worked more successfully from the first. The studies carried out under his direction, commencing in 1912, demonstrated conclusively that with pressures of less than 100 atmospheres it is possible to secure reactions carrying higher ammonia contents in the combined gas than was practised by the Badische Company. These important practical results are the more notable when considering former misgivings as to such high pressures at such high temperatures. His work has brought out unexpected and definite facts that are invaluable, particularly in connexion with hydrogen-nitrogen mixtures produced from coke or other fuels.

I believe there can be no dispute in the following facts: -

1. No plant has been erected before or since where hydrogen was produced from coke of a purity that made it possible to use the same catalyst year in and year out. To this day, Badische, Casale and Claude are known to change their catalyst every few months, and have had to work out a mechanical operation to simplify this very serious objection.

2. Notwithstanding Haber's contention that the synthetic equilibrium requires approximately 200 atmospheric pressures to be successful, the Badische, in actual operations, have found it advantageous, as already stated, to use high velocities, giving them less than one-half of the NH_3 contents in the gases leaving the converters than is the case at Syracuse, where lower pressures are employed. So the very theory, so far as conversion equilibria are concerned, has over a period of five and a-half years, shown that the Badische's original economic contentions were not justified.

3. It is now quite possible to control temperatures in single units having a capacity of 60,000 lb. synthetic ammonia or over in 24 hrs.

Dr. Waeser, in his preface, states that he has been able to deal with the literature up to the middle of March, 1921, up to which time, as is well known, Germany was the only factor in the production of synthetic ammonia.

The translator, however, says that Dr. Crowley deals with the considerable developments since the war. It is surprising, therefore, in 1926 to find such meagre references to the United States and France. Dr. Crowley lays stress on what he calls the most outstanding development of recent years - the progress of the Casale process, though that has dealt only with the combination of nitrogen and hydrogen, with little or no attention to the production of cheap hydrogen by the various processes, notwithstanding that hydrogen is the all-important element in the manufacture of synthetic ammonia.

Claude's work, also of the utmost importance, is hardly referred to, though Claude has not limited himself to the Badische pressures, but has gone enormously higher. The 1000 atmospheres he employs call for great engineering skill and indomitable courage. That he has splendidly overcome the difficulties incident to lubrication, joints and valves is well known. He therefore has the most compact and economical conversion apparatus.

It should not, however, be overlooked that high- or low-pressure synthesis concerns only about one-fifth or less of the operations and plant cost. The rest of the plant is concerned with the production of hydrogen and its purification and ammonia absorption. The advance in production of pure hydrogen is undoubtedly one of the most significant and important developments that has occurred.

There has not been a free exchange of costs under operating conditions that makes certain whether high pressures or low pressures will produce the cheapest ammonia with raw materials at the same cost. Casale has apparently concluded that Claude's high pressures are the safest to follow, for he has gradually increased his pressures, and has attempted to obtain some rights to his control of temperature by patent.

The fact that he has increased his pressures close to those employed by Claude has resulted in a suit for infringement on the Claude patent, brought by the Dupont Company, who are the sole licensees to the Claude process through their subsidiary, Lazote Inc., in U.S.

The contention that the United States farmer does not use nitrogen enough has only a theoretical justification. The farmer uses all the fertiliser he finds it profitable to use, so nitrogen must be supplied at a price that induces wider use. That goal will be reached gradually - as the advantages are proved under different conditions.

The high export duties charged by Chile have been a contributing factor towards the successful pursuit of the synthetic process of ammonia manufacture. Had there been no export duty, there might be no synthetic process in Germany, and perhaps the Great War would have been of short duration. The fact that Chile has imposed a heavy export tax has therefore fixed a temporary, economic limit in the use of nitrogen as a fertiliser.

The synthetic process is now forcing Chilean Government policies in this matter, and to some extent their action will determine the rapidity with which synthetic ammonia will be employed in the manufacture of fertilising materials.

The outstanding fact to-day is that Germany no longer has a monopoly in this field, since four giant financial groups are operating large plants with complete success and employing different mechanical systems. I refer, of course, to the Imperial Chemical Industries, Ltd., through their ownership of the Billingham plant, the Dupont Company owning Lazote Inc., and the earlier plant of the Allied Chemical Company of New York. They will progress even against the mighty Interessen Gemeinschaft of Germany. Each of these companies depends at present upon the manufacture of hydrogen from fuel of some sort, none of them having as yet seen fit to employ electrolytic hydrogen on a large scale, which is the source of hydrogen employed by Casale in the small plants using his process.

It is rumoured, however, that the Norsk Hydro are planning to erect a plant that will employ electrolytic hydrogen on a large scale in Norway, where they have the cheapest water power in the world, and therefore good reason for using it.

The synthetic process for the manufacture of ammonia is now therefore an accepted commercial fact in England, America and France, and Germany has no longer a monopoly in its production.

The following estimate from *Chemical and Metallurgical Engineering* gives the status of the air-nitrogen industry in America at June, 1926 :—

Company	Plant	Process	Capacity per day
Atmospheric Nitrogen Corp.	Syracuse, N.Y.	de Jahn	30
Lazote Inc.	Belle, W. Va.	Claude	20
Niagara Ammonia Co.	Niagara Falls, N.Y.	Casale	15
Mathieson Alkali Works	—	—	10
Pacific Ammonia Co.	Seattle, Wash.	F.N.R.L.	3
Koppers & Hasselacher	Niagara Falls, N.Y.	—	3
Belle Alkali Co.	Belle, W. Va.	—	1

METHODS OF RESEARCH IN APPLIED SCIENCE*

By H. MOORE, D.Sc.†

The view that research in applied science is necessarily inferior to research in pure science is unsound. The one essential difference is in aim. In the one case the object is the extension of scientific knowledge with no practical application in view, in the other case the goal is definitely utilitarian. The more advanced types of research in applied science may be quite as fundamental as any work in pure science, demanding quite as much knowledge, skill, initiative, and originality.

Before he begins his research the investigator should make his mind perfectly clear as to the aim or object of the work, as distinct from its subject. It is only too easy to choose a subject of work and to embark on a programme of experiments, without any clear idea of where the work is intended to lead. The investigator should make sure that his ideas as to subject and aim are in complete accordance with those of the authority selecting the research, and that the object is one which can be sought with some hope of success. Frequently a distinction can be drawn between the immediate aims and the ultimate object, which, as the definitely practical one, should never be lost sight of, though the immediate aims may present greater attraction to the scientific mind. As work proceeds, a problem may assume a different aspect and some re-statement of the aim may be necessary. In any case, a research worker should see that throughout the progress of his work its main object remains the controlling factor in its development.

When the problem is one directly concerning manufacture, the views of the industry are important. It will sometimes be found that different makers of the same product state the facts of the case differently, do not agree in their statement of the problem, and have divergent views about its extent and importance. It is well worth while going into these points carefully with different technical representatives of the industry, and the investigator will be ill-advised to reject altogether the apparently irreconcilable accounts he is given. Above all, he should never take the line that he knows all about it and has come to teach the manufacturer his

job. At the beginning of a practical research the attitude of the investigator should be that of a learner, not a teacher.

When his mind is clear as to the object and scope of the research, the investigator should make himself familiar with all available information bearing on the problem. How and what to read is a big question, and only one or two points can be mentioned here. Purely metallurgical literature is not enough; there is much essential matter to be found in physical, chemical, engineering, and even trade publications. The indexes of periodicals such as the "Journal of the Institute of Metals" are most useful for tracing information, but are never complete and exhaustive. Abstracts should be regarded as indicating where information is to be found, and not as reliable sources of information. A really useful knowledge of French and German is far too rare among metallurgists.

I wish to stress the importance of unpublished information, particularly when manufacturing processes are in question. The technical staffs of works often have valuable data, which can be obtained at the cost of some effort, tact and patience, with great benefit to the progress of a research. Manufacturing processes should be studied at first hand and, in suitable cases, in several different works, where there are certain to be differences in details if not in main features. Workmen can give information not obtainable elsewhere, and chatting with them while seeing some manufacturing operation is often profitable. It will be seen that I contemplate a fairly free entry of the research worker into the works making the product he is studying. This close association of research with manufacture I consider extremely important. The collaboration should be on terms of openness, freedom and equality. All information, whatever its source, should be examined critically. Serious errors are to be found in scientific papers published in the most reputable periodicals, while textbooks are almost notorious in this respect. An excellent plan, when the first survey of previous work and information is completed, is to write it up in essay form. You can only be sure you have clearly understood what you have read or been told when you can reproduce it in your own words.

Before experimental work is begun every endeavour should be made to estimate the kind and amount of work demanded and, consequently, what personnel, equipment and material will be needed. These should be viewed in close relation to the resources likely to be available. It is possible in many cases to adjust the scale of a research to the resources available, and while not embarking on such a full programme as one would like, to make a really useful attack on the problem within fairly narrow limits of expenditure. Much economy of time, effort and material may be achieved by careful planning in advance. It is wasteful to carry an investigation to a point at which some special apparatus, material or information is wanted, and then to have to wait weeks or months while it is being obtained, if the need for the special facilities could have been foreseen. What is required is to see the research as a whole, to plan the various items of work to fit well together, keeping the ultimate aim constantly in mind, to see that

* From an address given to a conference of research workers of the British Non-ferrous Metals Research Association, Oriol College, Oxford, January 1927.

† Director of Metallurgical Research, Woolwich

nothing essential is omitted or needlessly delayed, and to ensure that everything necessary is within the resources available. Throughout, the investigator should endeavour to see as far ahead as possible. Economy in purchase and use of apparatus and material is well worth constant attention. Economy of time and work of scientific personnel is also an important element in success. These matters should be regarded in a business-like way. Finance is a vital matter to all Research Associations. It is their duty to carry on their work with the smallest expenditure consistent with efficiency, and then investigators should co-operate whole-heartedly.

Usually only the opening work of a research can be planned in detail at the beginning, the later work being in broad outline which is expanded into detail as the work proceeds. The detailed programme should keep well in advance of the experimental work. In the case of a research into some occurrence the cause of which is obscure it often pays to start at the same time several more or less competitive lines of work. For instance, when we began work at Woolwich on the cracking of lead cable sheathing there was little to guide us. We began, almost simultaneously, work on the examination of many samples of cracked sheathing and of lead in other forms which had cracked, the mechanical properties of lead at different temperatures, the effect of prolonged stress with and without simultaneous corrosive action, crystal growth and recrystallisation, the effect of impurities in lead, and the resistance of lead and some of its alloys to fatigue. Several of these different lines of work led to the view that the cracking was failure by fatigue, and that the fatigue resistance of lead could be greatly increased by small amounts of alloy elements. Work was then concentrated on a more detailed study of the fatigue of lead and its alloys and on the manufacture, heat treatment and properties of certain binary and ternary alloys which promised to be largely if not wholly immune from the cracking. Had we worked only on the supposed analogy with season cracking, which at first seemed the most likely to provide the explanation, we should have been much longer in arriving at the truth.

There are many temptations in the path of the research worker in applied science. One is to follow a line of scientific investigation which is full of interest in itself, but does not help the main investigation. New and unexplained peculiarities in microstructure, in equilibrium diagrams, and in physical properties obviously call for further work, but unless it will assist the Research Association it is not justifiable to include it. Another temptation is to devote one's energies to mere technique and its improvement. A special variety of this concentration on technique for its own sake is the construction of new apparatus, an occupation which has a dangerous fascination for all of us. Given sufficient funds, it is easy and pleasant to fill a laboratory with physical apparatus capable of doing remarkable things. It is also expensive in time and money, and not infrequently actually delays the progress of the research it was originally intended to assist. The advantages of simplicity, and the danger of subordinating the end to the means should never be forgotten.

The importance of business-like methods in scientific research is sometimes neglected, and the idea is met that the research worker is an inspired genius who must choose his own more or less erratic methods of working. Everybody does not work at his best in precisely the same way, but the trained scientific worker should excel in orderly and systematic habits. The details and results of experiments, the records of conferences, discussions, visits to works, works trials, information derived from literature and elsewhere, should be written up as soon as possible in a clear, accurate, concise, and accessible form. All records should be fully intelligible to others, and it is worth while, at least, aiming at legibility in notes. Man is not only mortal, but mobile, and never knows at what stage his work may have to be continued by somebody else. The value of dating everything that is written can hardly be over-estimated, and the habit is easily cultivated.

The progress of a research should be frequently reviewed. The investigator should watch for the emergence of new facts which may alter its aspect or render some projected work unnecessary. A research that proceeds precisely according to plan is inclined to be a dull affair, and if it gives nothing but what was expected at the outset it is certainly not of the highest type. What is most important is to note any results pointing in a different direction from what was anticipated. Fresh hypotheses may have to be formulated, and a subsidiary programme arranged to test them.

It is difficult to realise the meaning of experimental results while they remain as laboratory notes, and it is advisable to write up all work done, at fairly short intervals. This writing up frequently leads to fresh ideas and to the detection of unsuspected effects, which can be specially watched for in later experiments. While conclusions should be drawn, as far as they are justified, in these progress reports, early generalisations on insufficient data should be avoided, and undue speculation is to be discouraged. Hypotheses should be within verifiable limits. It is well to use with caution the idea most fashionable at the moment, and to beware of employing the latest advances in physics for the construction of highly speculative hypotheses to explain some ordinary experimental result or observation. The simplest explanation should always be sought.

Difficulty in discarding preconceived ideas disagreeing with experimental results, and the inability to devise some plan to account for discordant results, arise from the natural conservatism of the human mind and the failure to do the necessary hard thinking. Few people ever do any real thinking. Most of those who think at all only do it rarely. The constant facing of difficulties, worrying at a problem from all angles until it becomes clear, requires effort, but is essential to successful research. A conviction that an early guess at the solution of a problem must be right often has a greater hold over the investigator's mind than he realises, and is highly dangerous in research work. The investigator should always be ready to receive new ideas, not at their face value, but critically and fairly. Sound judgment, hard and clear thinking, and an open mind are the requisites for drawing right conclusions from unexpected

results, and for forecasting the future development of the work.

Ultimate success has not been reached in a practical research until manufacture has changed in some way in consequence of it. When the regular output of a manufactured product is better in quality or more abundant or cheaper in cost, as a result of research, success has really been achieved. The application of research results in manufacture depends on the investigator only partially, but to a greater extent than he commonly realises. If he keeps before him the importance of successful application he will appreciate many points that he would otherwise miss—the practical difficulties of applying his suggestions, the need for putting his results in a form to appeal to manufacturers, the advantages of co-operating with manufacturers and understanding their point of view. It is not early enough to consider these matters when his work is finished; sound views on the practical application of his research will and should influence the whole of his work, from his preliminary collection of information and statement of the problem to the end.

THE MINERALISATION OF AMMONITE SHELLS.

By C. O. HARVEY, B.Sc., A.R.C.S.

Ammonites, remarkable for the multiplicity of their species during Jurassic times, are commonly found in a state of mineralisation which has involved the replacement of the carbonate of lime of the shell by iron pyrites, a process which at first sight appears to be very difficult of explanation by simple chemical reactions.

Fossils in this state are found in abundance in the Lias shales of Hauxsker Cliffs and in other parts of Yorkshire, and examination of a number of specimens has shown that, whereas partially pyritified shells are commonly found to contain crystals of calcite, the massively-mineralised specimens frequently contain crystalline gypsum, an observation which suggests that, during mineralisation, calcium carbonate is converted into (and possibly removed in solution as) calcium sulphate.

There is no lack of suggestions, some of them supported by experimental evidence, as to chemical reactions which may bring about the formation of iron pyrites and marcasite under natural conditions. Feld (*Z. angew. Chem.*, **24**, 97) states that, when sulphur and ferrous sulphide are formed together in a neutral or weakly acid medium and in the presence of reducing agents, combination to iron disulphide may gradually take place in the cold, the application of heat bringing about rapid completion of the reaction. He has also prepared iron disulphide by the action of hydrogen sulphide upon ferrous thiosulphate. Allen (*Mining Sci. Press*, 103, 113–114) states that pyrites and marcasite may be produced by the reduction of ferrous sulphate by carbonaceous material, and also as follows:—

The generation of hydrogen sulphide is commonly attributed to bacterial action upon ferrous sulphate and the proteins of decaying organic remains.

These theories do not explain the perfect replacement, particle by particle, of the calcium carbonate of ammonite shells by iron disulphide. Several theories accounting for this phenomenon appear to be possible, and attempts have been made to test their probability or otherwise experimentally.

Calcium carbonate may be replaced by ferric hydroxide (+ some basic ferric sulphate) by immersion in a solution of ferric sulphate, and, assuming the presence of excess of the ferric salt, the formation of iron disulphide may proceed as follows:—

No definite evidence supporting this theory has been obtained, though experiments have been carried out with shells, mixtures of ferric hydroxide and ferric sulphate contained in the pores of pipeclay tubes etc., and with equimolecular proportions of ferric sulphate and ferric hydroxide. The failure to obtain iron disulphide even upon heating in vacuo for several hours may possibly be due to the acidity developed during the reaction with hydrogen sulphide.

Two minerals, Raimondite and Illohanite (basic sulphates of iron) have been credited with formulae in which the ratio $\text{Fe}_2\text{O}_3 : \text{SO}_3 = 2 : 3$, and it seemed possible that such compounds might give rise to iron pyrites in one stage, as follows:—

Unfortunately, the existence of such compounds has been definitely disproved (Pickering, *J.C.S.*, **37**, 807. Cameron and Robinson, *J. Phys. Chem.*, 1907, **11**, 641. Posnjak and Merwin, *J. Amer. Chem. Soc.*, 1922, **44**, 1965. Applebey and Wilkes, *J.C.S.*, 1922, 337 T), and it was found that the addition of calcium carbonate to dilute solutions of ferric sulphate produced adsorption compounds approximating to the formula $2\text{Fe}_2\text{O}_3 \cdot \text{SO}_3$.

The last suggestion, which is thought to be the most probable explanation of the phenomenon, involves the reduction of very dilute solutions of ferric sulphate by hydrogen sulphide, the solution containing excess of hydrogen sulphide over that quantity required for the quantitative production of ferrous sulphide. Such solutions, containing ferrous sulphate, hydrogen sulphide, free sulphur, and sulphuric acid, will not deposit sulphide of iron in appreciable quantity unless some basic substance is present to neutralise the free acid, and the acid produced by the formation of these sulphides.

The occurrence of calcium carbonate, in the form of ammonite shells, in the vicinity will cause neutralisation locally, the shell being gradually replaced by ferrous sulphide, which, being slowly formed in the presence of colloidal sulphur and reducing agents, may readily change to the disulphide. It therefore seems possible that, under natural conditions, the replacement may take place in one stage as follows:—

Pure iron disulphide has been obtained experimentally in a manner analogous to the above suggested natural process by boiling the mixture resulting from the addition of a small quantity of calcium carbonate to excess of a solution of ferric chloride previously saturated with hydrogen sulphide. As was anticipated, when excess of calcium carbonate was added, the product was a mixture of ferrous sulphide, iron disulphide, and residual calcium carbonate.

CANADIAN INDUSTRIAL NOTES

The Canadian Fishing Co., Ltd., which has fourteen canneries in British Columbia, is erecting a large fish-reduction plant at Koprino Harbour, Quatsino Sound, N.W. Vancouver Island. The plant will have a daily capacity for the reduction of 125 tons of pilchards to fish oil, fertiliser, etc. This company has fish reduction plants at a number of its canneries to take care of salmon offal. At present there are fifteen fish reduction plants on the west coast of Vancouver Island, converting pilchards into fish oil etc.

The Distillers' Corporation of Montreal, Ltd., has merged with the Distillers' Company of Great Britain. The president of the Canadian subsidiary is Wm. H. Ross, chairman of the British company; vice-president, S. Broufman, Winnipeg. The Canadian company has an incorporated capital of \$2,500,000. The plant of the latter company is located at Ville la Salle, near Montreal, P.Q.

The salient features of the Shawinigan Water and Power Co.'s financial statement, recently presented at the annual meeting, were that the net revenue was the highest in the history of the company, being equal to 9.48% on the common stock at the end of the year, which was \$27,500,000. But the capital had been \$25,000,000 for ten months of the fiscal year, so the net average revenue would be over 10%. Reserves and surplus increased by over \$2,000,000 in the past year, and this account now stands at over \$8,850,000. The construction of the transmission line from Ile Malgoue to the city of Quebec was progressing favourably. Dealing with conditions, Mr. J. E. Aldred, president, expressed some concern about the ultimate supply of wood for pulp and paper mills, and entertained the opinion that, unless strong measures are taken to establish a policy of forest conservation, a time might come when no supplies would be available for the mills.

The Gatineau Power Co., a subsidiary of the Canadian International Pulp and Paper Co., has acquired two new electric power plants, the Bonhomme, on Blanche river, and that of the Papineauville Electric Co., on the Ottawa river. By the purchase of these two plants the Gatineau Power Co. has acquired important water rights on the Blanche, Ottawa and Nation rivers. The company now controls sources of available electrical energy amounting to nearly one million horse-power lying between Aylmer and Hawkesbury and Hull and Bitabee in the Ottawa district.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

ANNUAL GENERAL MEETING, JULY 4 to 8, 1927

ACCOMMODATION

Members who intend being present at the Annual Meeting, and who have not yet booked their rooms, are strongly urged to do so without delay, as hotel accommodation in Edinburgh during July is being rapidly reserved.

No single bedrooms are now available in the North British Station Hotel—the Headquarters of the Society—and only a few double rooms (with two beds) are still available.

Single room accommodation for both men and women is still available in the University Hostels. Immediate application for such should be made to the Hon. Secretary of the Section—Dr. W. T. H. Williamson, 13, George Square, Edinburgh.

A list of other hotels was published in *CHEMISTRY AND INDUSTRY* for February 4, 1927, p. 105.

RAILWAY FACILITIES

The Railway Companies of Great Britain (except the Metropolitan, the Metropolitan District, and London Electric Railway Companies) have agreed to issue tickets at the ordinary single fare and one-third for the double journey to persons travelling to Edinburgh to attend the meeting. Tickets will be available from Saturday, July 2, to Saturday, July 9.

It is urgently requested that all persons going by rail to Edinburgh for the meeting will take advantage of this concession.

BRITISH CHEMICAL ABSTRACTS INDEX, 1926

In accordance with intimation previously made, the Index to the Abstracts for 1926 will cover both Pure and Applied Chemistry. Members of the Society of Chemical Industry who are also Fellows of the Chemical Society will receive only one copy of the combined Index.

The Index is in active preparation, and will be issued as soon as possible.

ANNUAL REPORTS OF THE PROGRESS OF APPLIED CHEMISTRY—VOL. XI.

This volume of the Annual Reports (covering the year 1926) is now ready.

The price of the volume is 7s. 6d. to members of the Society and 12s. 6d. to non-members. Fellows of the Chemical Society, who are not members of the Society of Chemical Industry, can purchase the book at the price of 10s.

Orders for copies, accompanied by the appropriate remittance, should be sent to the General Secretary of the Society.

CHEMICAL SOCIETY'S LIBRARY

Members of the Society of Chemical Industry are reminded that they are entitled to consult the Library of the Chemical Society, Burlington House, Piccadilly, W.1, and to borrow books therefrom.

The Library is open daily from 10 a.m. to 9 p.m. Saturdays from 10 a.m. to 5 p.m. The Library is closed on Bank Holidays, the day following, and on other such occasions as the Council may direct.

DEATHS

Cawley, George (original member), of "Nippon," Cedar Road, Sutton, Surrey, Chemical Engineer. On March 3, 1927.

Rennie, Dr. E. H. (original member), of the University of Adelaide, South Australia, Professor of Chemistry. On January 8, 1927.

Turney, Sir John (elected 1887), of Trent Bridge Leather Works, Nottingham, Tanner. On March 17, 1927.

CHEMICAL ENGINEERING GROUP

Another paper entitled "Lubricating oils—Laboratory tests in relation to practical results," by A. G. Marshall and C. H. Barton, was read before a joint meeting of the Chemical Engineering Group of the Society of Chemical Industry and the Institution of Mechanical Engineers, which took place on April 1, at the Institution of Mechanical Engineers. Mr. F. H. Rogers, Chairman of the Group, presided.

The authors, in introducing their subject, pointed out that investigation into it had been carried on in two distinct ways:—by the theoretical or laboratory method in which attempts were made to determine the behaviour of an oil as a lubricant by testing its oiliness, coking, oxidation and other properties; and by the practical method, in which the lubricating properties were tested under actual conditions. After examining, in a Deeley machine, the "oiliness" of certain mineral oils and the effects of the addition of varying amounts of fatty oils, these oils were used to lubricate a specially designed piston testing machine driven by an electric motor with a swinging field which enabled a measure of the torque applied to be obtained, whilst the friction was measured by the rise in temperature of the jacket water. Further tests to see if temperature affected "oiliness" were made on an engine in which the cylinder was not water-jacketed, the temperature being registered by a pyrometer imbedded in the wall, as well as experiments on specially constructed bearings in which the abrasion was determined by loss in weight of the rubbing surfaces. As a result of all these experiments the authors state that an oiliness measurement cannot be relied upon as an indication of the general practical value of the oil, that oiliness has no influence on engines in any respect of friction or wear, and that substances added to give this oiliness can do more harm than good.

The carbonisation of the oil was then considered, the tests made on an air-cooled engine being compared with the forecasts obtained from laboratory tests. Other tests compared the behaviour of the lubricating oil on the crank case with that which would be predicted by laboratory tests, and the conclusion was drawn that although the formation of decomposition products in service is important in lubricating oil quality, the laboratory tests, at present, do not evaluate this factor correctly. Viscosity and its effect on the lubricating qualities of oils was investigated by the authors, who have

come to the conclusion that there is no justification for judging oil by its viscosity changes above 70° F.

A very large number of gentlemen desired to take part in the discussion which followed. Unfortunately time did not permit of all these gentlemen being heard, but they were asked to send in their contributions to the discussion to enable them to be published in the Transactions of the Chemical Engineering Group.

EDINBURGH AND EAST OF SCOTLAND SECTION

At the annual business meeting of the Edinburgh and East of Scotland Section, Mr. W. A. Williams in the chair, the following elections were made:—Chairman: Major R. Bruce, M.C., F.I.C.; Vice-Chairman: Dr. W. T. H. Williamson; Hon. Secretary and Treasurer: Mr. W. M. Ames, M.A., B.Sc., A.I.C. The vacancies on the Committee were filled by the election of Professor J. Read, Mr. W. A. Williams, Dr. W. O. Kermack, Dr. W. N. Stokoe, Mr. James Strathan, and Mr. James Sandilands.

GLASGOW SECTION

The annual business meeting was held on March 25, in Messrs. Ferguson and Forrester's Restaurant, Glasgow, with Mr. S. H. B. Langlands in the chair.

The reports of the hon. local secretary and treasurer were read and adopted. Attention was specially directed to the increased attendance at the meetings during the session, and to the fact that the student associates were joining the Society whenever they became ineligible for the associateship.

Mr. D. A. MacCallum presented his report as the representative of the Section on the Glasgow Chamber of Commerce, and it was agreed to continue the representation.

The following elections were made to fill vacancies on the local committee: Chairman, Mr. S. H. B. Langlands; Vice-Chairman, Mr. Douglas A. MacCallum; Hon. Local Secretary, Dr. J. A. Cranston; Members of Committee, Messrs. W. G. Hiscock, C. M. Keyworth, J. W. Mitchley, E. M. Melville and W. H. Nuttall; Chamber of Commerce Representative, Mr. D. A. MacCallum.

A vote of thanks was accorded to the retiring members of committee, and thereafter a joint smoking concert with the local section of the Institute of Chemistry was held, at which the Glasgow University Alchemists' Club, the Andersonian Chemical Society, and the Ardeer Chemical Club were present as guests.

MANCHESTER SECTION AND CHEMICAL ENGINEERING GROUP

A very well-attended meeting of the Manchester Section, the Chemical Engineering Group, and the North Western Section of the Institution of Mechanical Engineers was held in Manchester, on March 31, at which Dr. W. R. Ormandy further discussed the paper on "Lubrication," read on March 25 in London at the Joint Meeting of the Group and the Institution of Mechanical Engineers. In the discussion Mr. L. G. Radcliffe, Chairman of the Manchester Section, expressed the Section's sense of the importance of joint meetings of workers in different scientific and industrial fields.

MANCHESTER SECTION

The annual meeting was held at the Textile Institute on April 1, Mr. L. Guy Radcliffe, M.Sc.Tech., F.I.C., being in the chair. Messrs. M. F. S. Choute, J. R. Hannay, W. Hubball, H. Levinstein, D. M. Paul, and F. H. Terleski were elected members of the committee.

The hon. secretary, Mr. A. McCulloch, A.I.C., presented his report of the proceedings of the Section during the year. A new feature which had been introduced was the holding of a meeting in collaboration with the Fuel Section of the Society and with those societies which were directly co-operating with the Fuel Section. Concurrent with this meeting, on November 26 last, a National Coal Products, Chemical and Engineering Exhibition was open from November 16 to November 27. Although the period in which the exhibition was held coincided with the coal strike, which detracted very considerably from the success which would otherwise have attended this effort, the opinion of the Sectional Committee and of the exhibitors, as well as of those who attended the exhibition, was that it was distinctly successful. On May 6 a joint meeting was to be held with the Fellows of the Chemical Society resident in Manchester. This was a distinct innovation, and had been arranged primarily to further the good relations which already existed between the Chemical Society and the Society of Chemical Industry. It was hoped that, in some measure, it would give support to the scheme of collaboration between the societies, whereby Fellows of the Chemical Society might read papers at the meetings of the local sections of the Society of Chemical Industry. Nine papers had been read at the six meetings held during the Session. The membership of the Section was about 500.

The chairman announced that Prof. F. L. Pyman, who had been persuaded to fill the chairmanship of the Section for the ensuing session, had found himself compelled to withdraw from that position as he was about to take up an industrial post. For the same reason he had relinquished his positions as a Professor of Technological Chemistry at the Manchester University and the College of Technology.

The ordinary monthly meeting of the section was then held, and Dr. W. Rosenham, F.R.S., Superintendent of the Metallurgy Department of the National Physical Laboratory, gave a description of the work done at the laboratory.

Dr. Rosenham first described the origin of the National Physical Laboratory, and said that the purpose of the Laboratory was to aid the application of science, especially of physics in all its branches, to national and industrial needs. In spite of some early opposition, based upon unfounded fears and jealousies, it rapidly made its usefulness felt, and proved of great importance during the war. Even before the war, however, it had grown so large and important that the financial responsibility was more than the Royal Society could undertake, and the transfer of financial responsibility to the Government was suggested. This was carried out at the end of the war, and the Laboratory is now a part of the Department of Scientific and Industrial Research, although an Executive Committee appointed by the Royal Society still retains the scientific management. The Laboratory

now has seven departments, a scientific staff of over 130, and a total staff of over 500. Similar national laboratories exist in most of the more important countries of the world. The "Reichsanstalt," near Berlin, is one of the best-known, while the United States Bureau of Standards is probably the largest, but the National Physical Laboratory holds a foremost place among such institutions, and represents one of the finest organisations for scientific standardisation, testing and research in the world.

The lecturer then gave a brief sketch of some of the more striking activities of the Laboratory, dealing in turn with examples of the three great branches of work. In regard to standardisation, mention was made of the precision gauges used by engineers, of survey tapes, of weights, chemical glassware, and even of taximeters. Measurement down to the one millionth of an inch is now becoming a routine matter. Thermometers, including thousands of clinical thermometers and all types of precision thermometers and pyrometers, are standardised, whilst in another division of the Laboratory attention is given to X-rays and protective measures for those engaged in their use. Electrical meters and instruments of all kinds are standardised in great numbers, and much fundamental work has been done in the more accurate determination of the fundamental electrical units, the ampere and the volt. Means for testing insulating materials under electrical pressures up to one million volts are now being installed.

A long list of examples of the testing and research work of the Laboratory was given. Among these may be mentioned the recent work on the acoustics of buildings, whereby the behaviour of a hall can be predetermined by the use of small models and the photography of minute sound-ripples. Suitable adjustments can then be made to bring the hall to a satisfactory state for the hearing of speech or music. Interesting work on wireless waves was also mentioned, and in the latter part of the lecture the work on metals and alloys was briefly outlined. Recent achievements of the Laboratory relate to the production of gas-free metals by simple means, the production of new alloys capable of giving high strength at very high temperatures, and the production of a series of metals - iron, manganese, chromium, silicon and the rare metal beryllium - in a far higher state of purity than had previously been attained.

NOTTINGHAM SECTION

The seventh meeting was held on March 30, Dr. E. B. R. Prideaux in the chair. Prof. A. R. Ling delivered a lecture on "Accessory agents in biochemical and physiological reactions."

The lecturer referred to the important work done recently on hormones, vitamins and enzymes. These, he said, were carbon compounds, some of them containing nitrogen, phosphorus and sulphur, together with mineral matter. Hormones seemed invariably to contain nitrogen and sometimes sulphur. Vitamins, in so far as they had been investigated chemically, contained carbon and hydrogen. Enzymes, at one time thought to contain proteins as an indispensable constituent, had been obtained free from protein, yet no enzyme preparations had been obtained free from nitrogen.

Hormones appeared to be comparatively simple substances, and two of them at least had been obtained synthetically, whilst there is great hope that others might be made in the laboratory. Thus the chemist had—and still hopes to extend his success—opened up another source of supply for these substances which were present only in the minutest traces in living tissues. It was too early to speculate what the chemist might do in regard to producing vitamins *in vitro*, but here it would seem that by the application of certain forms of energy, e.g., ultra-violet light, to organisms and their foods, one at least of these obscure substances might be produced. Enzymes will probably defy the chemist in his efforts to produce them *in vitro*, and here again we must look to the physicist for help.

Hormones would appear to be definite chemical entities. Bayliss and Starling observed in 1901 the manner in which the pancreas is excited to activity and came to the conclusion that a chemical agent, belonging to a class of substances some of which were previously known, is concerned in bringing about this activity. Hormones were produced in one organ and carried by the blood stream to another on which their effect was manifested. Characterised by the property of serving as messengers, by which the activity of certain organs was co-ordinated with that of others, W. B. Hardy proposed the name hormone (I arouse to activity). The hormone of the suprarenal gland, adrenaline, was first obtained in a crystalline state by Takamine in 1901, and it was first synthesised by Stolz from catechol in 1903. The hormone of the thyroid gland (thyroxine) has been synthesised recently by Harington.

The hormone of the pituitary gland and of the endocrine gland of the pancreas, insulin, were also dealt with, and the work of Mr. F. H. Carr on the manufacture of the latter substance was described. It was then pointed out that adrenaline, thyroxine, and the hormone of the pituitary gland acted in the opposite direction to insulin, which promoted the storage of sugar as glycogen in the liver and depleted the blood sugar. In normal health, therefore, there was a balance between the first three named hormones and insulin.

The lecturer next dealt with vitamins, five of which now known were described. He mentioned the work of Drummond on the isolation from cod liver oil of vitamin D, and also the work of Rosenheim, Webster and Drummond on the production of this vitamin by irradiation of certain sterols with ultra violet light, which culminated in the discovery by Rosenheim and Webster that vitamin D, or at all events an anti-rachitic substance, could be obtained from ergosterol or an unsaturated sterol of similar constitution. This sterol could be made either from ergot or from a substance extracted from yeast by ether.

Enzymes are substances or mixtures of substances in the presence of which a reaction capable of proceeding slowly is accelerated. Prof. Ling described the work of Robison on ossification and dentition by an enzyme present in bone named phosphoric esterase which brought about the deposition of calcium phosphate by its action on calcium hexose-phosphate.

Attention was drawn to the fact that alcoholic fermentation of sugars has been shown by Harden to occur

through the medium of hexose-phosphate, and it was suggested that polysaccharides such as starch etc. were probably formed also through the medium of hexose-phosphates. The deposition of calcium phosphate has been found to require a hydrogen-ion concentration of p_H 9.0–9.2, whereas the formation of polysaccharides would probably take place at p_H 4.5–6.4.

The recent work on oxidation and reduction in the organism was next considered, and the synthesis of glutathione by Stewart and Tunnicliffe from glutamic acid was alluded to.

The author concluded by drawing attention to the great services rendered in this department of physiology by research work from the pure chemist, some of the substances for which previously they had to depend entirely on the living organism having been synthesised *in vitro* by organic chemists.

OTTAWA SECTION

Dr. Harold Hibbert, Professor of Industrial and Cellulose Chemistry, McGill University, addressed a joint luncheon meeting of the Ottawa Valley Graduates' Society of McGill, and the Ottawa sections of the Society of Chemical Industry and Canadian Engineering Institute, in the Chateau Laurier, Ottawa, on February 23, upon "Borderland science and its bearing on industry and civilisation." Dr. F. W. C. Mohr presided.

Dr. Hibbert defined borderland science as the intermediate and indefinite sphere lying between two or more branches of specific sciences. He maintained that development and advancement in many industries, and scientific achievements, could only be accomplished by the cultivation of borderland science, illustrating the progress which had followed in industry, therapy, preventive medicine, etc. by the scientific co-operation of the physicist, engineer, physiologist, pharmacologist, and bacteriologist with the chemist. The development of Canada, and civilisation in general, in the next fifty years depended on the progress attained in this sphere of scientific co-operation. The speaker presented numerous examples of successful developments in industry, engineering, medicine, and other branches of science entirely due to co-operation with the chemist. The prosperity of Canada depended on its natural resources and their intelligent development, and he suggested a number of lines by which this could be advanced. He was of the opinion that Canada would never truly develop until its agriculture was regarded and treated as a chemical industry.

At the regular meeting on March 17, with Mr. A. E. MacRae presiding, a paper was read by Mr. C. E. Watson on the subject "Driers, as applied to paints and varnishes." Investigation on the action of driers is of comparatively recent growth, but the results are promising, and are displacing rule of thumb methods in mixing paints and varnishes. Driers are substances which accelerate the atmospheric oxidation which takes place at the double bonds of the unsaturated glycerides of the drying oils. When linseed oil is blown, which may be considered as a speeded-up air drying, it shows practically no change in viscosity or film formation for the first 10 hrs., but after that period a progressive increase of

viscosity is apparent. Then peroxides are formed, and the increase of viscosity and film formation proceeds auto-catalytically. Insoluble colloidal phases are formed which tend to orientate at surfaces and so form the dried film.

Although many driers are known, considerations of utility and cost narrow the field to compounds of lead, manganese and cobalt. These vary in their solubility in oils, and also do not produce similar end results: thus it is found advantageous to use combinations of them. The best proportions have been found to vary within narrow limits and are small in amount, because of this, painters are very apt to put too much drier in their mixes, thinking they will speed up drying, but with quite opposite results.

These investigations brought out the fact that there were very many variables, but the findings of some six years have been averaged so that they will apply quite well to practically any of the drying oils as they come on the market.

CALENDAR OF FORTHCOMING EVENTS

- Apr. 8. **PHYSICAL SOCIETY**, Imperial College of Science, South Kensington, S.W., at 5 p.m. (1) "A carbon dioxide measuring instrument based on sound-velocity measurement," by E. Griffiths. (2) "The scattering of X-rays and the J' phenomenon," by B. L. Worsnop. (3) "The characteristics of thermionic rectifiers," by Prof. C. L. Fortescue.
- Apr. 8. **SOCIETY OF DYERS AND COLOURISTS, Manchester Section**, Literary and Philosophical Society, 36, George Street, Manchester, at 7 p.m. Annual Meeting. (1) "Photographic effects on cellulose acetate," by A. J. Hall and R. A. Hill. (2) "Note on the effect of light on coloured cotton fabric," by Miss Hibbert. (3) "The dyeing of cotton containing neps," by J. G. Lawrie. (4) "A new aim for the Society," by R. V. Taylor. (5) "Some notes on an emulsifying medium," by G. M. Williams.
- Apr. 8. **SOCIETY OF CHEMICAL INDUSTRY, Chemical Engineering Group**. The meeting arranged for this date has been postponed.
- Apr. 8. **INSTITUTE OF METALS, Sheffield Local Section**, The University, St. George's Square, Sheffield, at 7.30 p.m. "Refined silver for electro-plating anodes," by E. A. Smith.
- Apr. 11. **INSTITUTION OF ELECTRICAL ENGINEERS**, Savoy Place, Victoria Embankment, London, W.C.2, at 7 p.m. "The maintenance of small electric power plants." Discussion opened by T. Hodge.
- Apr. 11. **CERAMIC SOCIETY**, North Staffordshire Technical College, Stoke-on-Trent, at 7.30 p.m. Annual Meeting.
- April 11. **INSTITUTE OF BREWING, London Section**, Engineers' Club, 39, Coventry Street, W.C., at 7.45 p.m. "Methods of refrigeration in the brewery and their practical application to beer chilling," by J. McOustra.
- Apr. 12. **INSTITUTION OF PETROLEUM TECHNOLOGISTS**, House of the Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m. "Jet and jetonised material," by E. H. Cunningham Craig.
- Apr. 13. **ELECTROPLATERS' AND DEPOSITORS' TECHNICAL SOCIETY**, Northampton Polytechnic Institute, St. John Street, Clerkenwell, London, E.C.1, at 8.15 p.m. "Strains in electrodeposited metals," by R. H. T. Barklie.

OIL AND COLOUR CHEMISTS' ASSOCIATION

The ninth annual dinner of the Oil and Colour Chemists' Association was held at the Hotel Cecil, London, on March 30. Mr. C. A. Klein, the President, was in the Chair.

Dr. E. F. Armstrong, F.R.S., proposing "The Oil and Colour Chemists' Association," said that although it was discovered 500 years ago that linseed oil would carry a pigment and make a paint, nobody had yet discovered what linseed oil really is. Personally, he had urged university friends to investigate the structure and chemistry of linseed oil, but had never yet succeeded in finding a university professor who was willing to do it. There was thus considerable work awaiting the Research Association, although in the list of problems to be tackled he did not see much mention of linseed oil. After referring to the value of the work of the Department of Scientific and Industrial Research, Dr. Armstrong said that chemistry, and particularly organic chemistry on its industrial side, had taken on an entirely new lease of life; progress was making rapid strides, and in no branch of organic chemistry was the progress so rapid as in the oil and colour branch. It was a toss up whether the application of paint and colour to surfaces would not enter upon an entirely new development, for the use of the new cellulose lacquers and artificial resins might very well, within a few years, entirely change our ideas as to protection against corrosion and as regards decoration. The Association had made progress during the past year largely owing to the co-operation of the Society of Chemical Industry, the Federation of Paint Manufacturers, the Institute of British Decorators and the Institution of the Rubber Industry, and two other very important factors in the work of the Association were the progress made by the British Engineering Standards Association with regard to standardisation of paint materials, and the start made by the Research Association. When we realised that 20 years ago the vehicles, gums, resins and solvents, on which the industry is entirely dependent were natural products, with the enormous variations which ordinarily occur, it was obvious that the progress of the industry lay largely in the study of the vagaries of these products, because there was little knowledge of the fundamental principles involved. To-day the problems of the industry were being investigated in two ways, first, the detailed investigation of the fundamental properties of the raw materials, as instanced by the work of Dr. Morrell on linseed oil and drying oils, and the work of Eyre on flax, in regard to the control of natural products, and secondly, the synthetic chemist was endeavouring to produce alternatives and not merely substitutes in the narrow meaning of the word. Personally, he considered that the future of the oil and colour industry lies very largely in the application of synthetic organic chemistry to many of the problems. Mention had been made of cellulose lacquers. The consumption of this material in the United States in 1925 was said to be 11,000,000 gallons, a fact which should cause us to think in this country. As to paint products generally, however, he made no apology for any of the English products. We can and do produce products of excellent quality, but if we are to maintain that supreme position we must apply more and more science.

Sir Alexander Gibb, President of the Institution of Chemical Engineers, responding to the toast of "The Guests," proposed by Dr. J. J. Fox, said his Institution was always at the service of the Oil and Colour Chemists' Association.

Mr. F. H. Carr, C.B.E., President of the Society of Chemical Industry, who also responded to the toast, said chemistry as a whole is very complex, and the progress of applied chemistry is dependent upon the inter-connexion between the various sections. Therefore the Society of Chemical Industry did not desire the oil and colour, or any other department of applied chemistry, to become disconnected from the Society, because the progress of applied chemistry depends on all branches learning from each other. Societies such as these constituted the university in which their post-graduate training continued throughout their lives, and it was the object of the Society of Chemical Industry to promote that knowledge and to create that thought which constitutes the force by which industry alone can evolve, and the industry of this country would have to evolve to something very much greater than it is at present if the nation is to take its proper place in the world in generations to come. It was not asked that the other associations should lose their individuality in any sense; on the other hand, it did not desire to see wasted effort and unnecessary overlapping in publications on matters in which they were all concerned. Referring to the Research Association of British Paint, Colour and Varnish Manufacturers, he expressed the profoundest hope that the longest possible view would be taken, and that the researches would be as fundamental as could possibly be afforded. Success or failure depended upon taking a view which would not leave them disappointed if they did not get results in one year or two years, or even five years.

Prof. H. E. Armstrong, who was specially asked by the President to speak, congratulated the Association on the progress it had made since its first annual dinner, and referred to the President as a far too modest man who had rendered immense service to the industry. Personally he had been fighting the battle of white lead for a good many years, and would go so far as to say that whatever they might have heard about cellulose varnish, in the end, for outside work, white lead and linseed oil will carry the day. The public generally had never yet been properly informed on this subject, and it was very important that it should be more protected than it is in this matter.

Sir Frank Heath, Department of Scientific and Industrial Research, proposing the final toast of the evening, "The Research Association of British Paint, Colour and Varnish Manufacturers," said there was a certain sadness attaching to this occasion, because it would be the last time that he would have the opportunity of speaking as the representative of the Department of Scientific and Industrial Research. The success of that Department, however, was due entirely to the fact that its policy was directed by a body of scientific men, and he hoped this would always be the case.

Mr. S. K. Thornley, Chairman of the Council of the Research Association of British Paint, Colour and Varnish Manufacturers, replied to the toast, and acknowledged

the great assistance that had been given to the Research Association by the Department of Scientific and Industrial Research and also by a large number of scientific men who had come forward and helped with advice and assistance. He specially mentioned Dr. Fox, Dr. Lowrie, Dr. H. H. Morgan, Dr. Morrell, and Mr. Klein in this connexion. He expressed the hope the time would come when some of the nice things said with regard to the Oil and Colour Chemists' Association would be said of the Research Association. At the moment it had not got to that stage. The Research Association wanted more members, although as compared with most other associations formed in the same way he thought it was getting along very well. There was an assured income of about £5500 per annum, but in the early stages there were bound to be very heavy overhead charges. Perhaps out of the first £4000 subscribed, half would be required for rents, rates, taxes and equipment, leaving only £2000 for salaries of staff. After these items were met, however, every £1000 would be spent in getting the best men and the best brains possible, and that was why it was so very important to increase the income of the Research Association. It had been stated that the Research Association was not being supported by the colour makers. That, however, was wrong, because the figures showed that the actual subscriptions received from the three classes of members, viz., colour makers, paint makers and varnish makers, were almost identical. Again, it had been stated that the Research Association was making a mistake in not stating what it was going to do. It was suggested that if a definite programme was laid down, there would be a lot more members join. That, however, he felt would be fundamentally wrong, because it was absolutely essential that the people who joined the Association and found the money should have some say as to the nature of the work to be done and the direction in which research should be prosecuted. He could not conceive the work of the Association being done on any other lines. It was suggested, apparently, that if the Association stated it was going to investigate cellulose paints, more members would be obtained. It might be that one or two would join, but such a statement would not bring in a single colour maker, because they might say it would take five years to investigate cellulose paints and that there would be no time to deal with colour. It was a fact that there were some manufacturers who had not joined the Association. In some cases he believed he knew their reasons, and in other cases the firms had their own research staffs and felt that they did not need the Research Association. These few firms were large and prosperous firms, and he wished to put it to them most strongly that, even if it were true that they do not need the Research Association, they should support the Association in the best interests of the trade, regardless of their own interests.

BAUXITE IN FRANCE

A Bill has been put forward with the object of reserving the French national production of bauxite so that the ever-growing needs of the French aluminium industry may be filled.

OBITUARY

DR. F. B. POWER

Dr. Frederick Belding Power, Ph.D., LL.D., who died of heart failure, on March 30, at Washington, D.C., U.S.A., will best be remembered by British pharmacists as Director of the Wellcome Chemical Research Laboratories, a position he held from the founding of the Institution in 1896 until 1914. By early training a pharmacist, Dr. Power retained his interest in pharmacy throughout his life-work in England, Germany and America, and his death removes a figure of international influence in pharmaceutical and chemical research.

Born on March 4, 1853, at Hudson, New York, Dr. Power commenced his association with pharmacy at an early age. Five years later he was working as a practical pharmacist in Chicago. From Chicago he moved to Philadelphia and was connected with the business of the late Professor Edward Parrish, a notable pharmacist and lecturer of those days, whose name is linked inseparably with the compound syrup of phosphates commonly known as Parrish's Food. In 1871 he graduated in pharmacy at Philadelphia and was awarded the prize in chemistry. In 1876 we find him in residence at the University of Strasburg, where he took his degree in 1880, after acting as assistant to the famous Professor Flueckiger during 1879. Returning to America in 1881, he became Professor of Analytical Chemistry at the Philadelphia College of Pharmacy. Two years later he was called upon to establish the school of pharmacy at the University of Wisconsin, where he occupied the chair of Pharmaceutical Chemistry and Materia Medica.

In 1896, at the invitation of Mr. Henry S. Wellcome, Dr. Power came to England as first Director of the Wellcome Chemical Research Laboratories. In this way a close personal friendship dating from boyhood was renewed. Mr. Wellcome and Dr. Power were classmates at the Philadelphia College of Pharmacy, at which time neither could have foreseen that they would later be associated in research work for years. Under his direction no less than 168 scientific papers from the Wellcome Chemical Research Laboratories were communicated to learned societies, and during this period Dr. Power gained a wide reputation as a research chemist particularly in the field of plant chemistry, which he made peculiarly his own. One of his most important researches was his investigation of the constituents of chamomilla and hydnocarpus seeds, which ultimately formed the foundation on which has been built up the modern treatment of leprosy.

In 1911 Dr. Power returned to America, where he was appointed Director of the Phytochemical Laboratory of the Bureau of Chemistry at Washington, D.C., a post he held until his death.

Dr. Power's scientific work made him the recipient of many honours. In 1908 the University of Wisconsin conferred upon him the honorary degree of Doctor of Laws, and in 1913 he was awarded the Hanbury Gold Medal. In appreciation of this honour he was presented by his colleagues and associates with an illuminated address. In 1921 Mr. Wellcome, founder of the research institution bearing his name, presented Dr. Power with a gold medal bearing the doctor's profile

portrait in relief and commemorative of his distinguished services to science. Dr. Power was an honorary member of many scientific societies and institutions, and in America was recognised as one of the leading pharmacognosists. He was a Fellow of the Chemical Society of London and a Member of the corresponding Societies in America and Berlin. Corresponding Member of the Royal Society of Pharmacy of Brussels; Honorary Member of the Philadelphia College of Pharmacy; Vice-President of the Society of Chemical Industry, 1904-6, and he served on the Council and Publications Committee of this Society. He was awarded the Ebert Prize in 1877, 1892, and 1920.

Dr. Power served on the Committee of the United States Pharmacopoeia, and in 1920 was elected Vice-President of the United States Convention. One of the last honours that was bestowed on him was his appointment, by the President of the United States, as a member of the National Research Council on the Committee of Federal Relations.

PERSONAL AND OTHER ITEMS

Lord Gamford has been elected president of the Federation of British Industries in succession to Sir Max Muspratt.

Mr. Henry Mond has been elected to a seat on the board of Barclays Bank, Limited.

Professor F. L. Pyman, Ph.D., D.Sc., F.R.S., has resigned his chair of technological chemistry in the University of Manchester and the College of Technology, as he has been appointed head of the research laboratory of Boots Pure Drug Company.

Dr. J. W. Mellor, D.Sc., Principal of the Pottery Department of the North Staffordshire Technical College, conducted under the auspices of the City and County Councils, was entertained at luncheon by the Council of the North Staffordshire Chamber of Commerce on Wednesday last week, in recognition of his nomination as a Fellow of the Royal Society. Sir Francis Joseph, who presided, observed that Dr. Mellor had brought to his work an original mind and an immense power of application. He was the Secretary of the Ceramic Society and a Director of the British Refractories Research Association, but his chief claim on the goodwill of science was due to his authoritative and standard work—a "Treatise on Inorganic Chemistry." Business men, Sir Francis Joseph added, were paying increasing attention to the value of scientific research as an adjunct to their businesses, and North Staffordshire owed much to men who had laboured on the technical side of the pottery industry.

Dr. A. M. Smith, B.Sc., has been appointed lecturer in agricultural chemistry in the University of Manchester and Adviser under the Ministry of Agriculture Advisory Scheme.

Dr. John E. Teeple announces his intention to retire from his post as Vice-President and Director of the American Potash & Chemical Corporation. He will continue his connexion with the organisation as consulting chemical engineer.

Mr. M. C. Whitaker has announced his intention to retire from his post as President of the U.S. Industrial Chemical Co., and Vice-President of the U.S. Industrial Alcohol Co. The retirement will take effect at the Annual Meeting of the Corporations in April. He will continue his connexion with the organisation as a Director and as Consulting Chemical Engineer.

We regret to announce that Prof. D. A. Gilchrist, who retired a few weeks ago from the chair of agriculture at Armstrong College, Newcastle, died suddenly on April 4, at the age of 67. Prof. Gilchrist's detailed work on the use of phosphatic fertilisers at the famous Cocker Park has greatly influenced agricultural science, and the loss of his services to agricultural education and development will be deeply felt.

The late Mr. J. F. Moseley, J.P., senior director of David Moseley & Sons, Ltd., the Manchester firm of rubber manufacturers, left £226,028, with net personalty £207,175.

The late Mr. W. J. Emery, colour manufacturer, of Stoke-on-Trent, left £6,501, with net personalty £4,289.

Artificial Silk Exhibition

The second annual exhibition of British artificial silk goods was opened at Holland Park Hall on April 4 by Sir Burton Chadwick, M.P., Parliamentary Secretary to the Board of Trade, who said that the chief impression left upon his mind, after going round the exhibition, was the great beauty of British workmanship. Proposing the toast of "The British Artificial Silk Industry" at a luncheon at the Hotel Cecil, he said that the artificial silk industry was one of the outstanding industrial developments of the age, and formed one of the brightest constellations in our industrial firmament of the future. From the wide view he was able to take from the Board of Trade department of British trade generally, he could say that the artificial silk industry stood in the forefront both in production and in quality, and it could stand up to all competitors. At the exhibition that morning orders amounting to at least £10,000 had been received. He was told that British artificial silks led the world. Their foreign competitors might produce low-grade and cheap quality yarns, but they had not so far attained the uniformity of product nor the quality that distinguished British yarns. Dr. E. F. Armstrong proposed the toast of "The Dyers and Finishers," and said that the achievement with regard to artificial silk was only the forerunner of many great achievements, and he asked them to give all the encouragement they could to research work. Mr. H. Sutcliffe Smith acknowledged the toast.

Mercury from Coal Tar

Dr F. W. Aston contributes a letter to *Nature* of April 2, in which he deals with the isotopic constitution of mercury derived from coal tar. Mr. W. Kirby, of the South Metropolitan Gas Co., had furnished a sample of the mercury, which appears in the lightest of the fractions distilled, and occurs to the extent of about one part in seven millions of undistilled tar. Dr. Aston obtained a number of mass spectra, in which the groups of isotopic lines were indistinguishable from those of ordinary mercury.

Hydrogenation of Coal

The Joint Standing Committee for Research of the University of Birmingham, in a report on last session, deals with researches in progress in the Mining Laboratory, particularly in relation to hydrogenation, spontaneous combustion, and the research for the control of atmospheric conditions in hot and deep mines.

Regarding hydrogenation of coal, it is pointed out that progress has been made in the investigation into the conversion of coal into oil. A considerable amount of work has been carried out to obtain information regarding the type of coal most suitable for treatment in this way, i.e., the type which will give the highest oil yield. Specimens of coal ranging from lignite to anthracite, and including cannel coals from different sources, have been tested in detail with valuable results. Comparative tests have been carried out in the high-pressure autoclave using nitrogen in place of hydrogen, and also by carbonisation under atmospheric pressure. These experiments have shown that the carbonaceous material which yields the greatest amount of tar and oil by carbonisation at low temperatures does not necessarily give the largest yield by hydrogenation.

The large amount of product—definitely a product of hydrogenation—formed during the tests on some coals and the possibility of the conversion of this into oil by further hydrogenation points to the necessity for more detailed investigation of the physical and chemical nature of this product. Other experiments carried out during the past year have included the treatment of bright coal (clarain) from the Warwickshire thick coal in the form of an exceedingly fine powder suspended in water (material ground in colloid mill) at various temperatures up to 360° C. and pressures up to 245 atmospheres. The work includes hydrogenation tests on the various portions into which coal may be separated by the solvent action of pyridine and chloroform (α , β and γ compounds) and by means of phenol. The residue obtained after extraction with phenol of Warwickshire thick coal, vitrain (slate seam), has been tested in the high-pressure autoclave, viz., the standard hydrogenation procedure, with instructive results.

Third Census of Production (1924)

COAL

The following data are extracted from the "Preliminary Reports," of the Third Census of Production (1924):—During the year 1924 the total quantity of coal mined amounted to 265,429,000 tons, valued at £250,306,000, compared with 266,459,000 tons in 1907, valued at £119,507,000. In addition, 16,000 tons of coal was raised in collieries which were mainly in process of development during the year, and the selling value of this output was £12,000. Other products, including iron ore, iron pyrites, fireclay, other minerals raised, brought the total value to be added in 1924 to £1,140,000. Exports of coal in 1924 amounted to 79,340,000 tons, which includes 17,689,000 tons shipped for the use of steamers engaged in the foreign trade in 1924, compared with 82,220,000 tons exported in 1907, which figure included 18,519,000 tons shipped for the same purpose in that year. Exclusive of 8,000

tons of imported coal retained in the United Kingdom, 186,089,000 tons was retained in Great Britain during 1924, as against 184,340,000 tons in 1907. The net output of the coal mines covered by the above statement amounted in value to £209,820,000, which represents a net output per person employed of £175 in 1924, and £127 in 1907. The number of persons employed in the industry was 1,175,733 in 1924, and 837,785 in 1907. The total capacity of the engines engaged in the industry during 1924 was returned as 3,341,460 h.p., compared with 2,293,256 h.p. in 1907. The capacity of electric generators at collieries was 778,363 kw. in 1924.

COKE AND BY-PRODUCTS

In 1924, 12,803,000 tons of coke were produced, valued at £16,859,000, being 4% greater and 57½% higher in value than the amount produced in 1907, which totalled 12,322,000 tons, valued at £10,304,000. Tar products in 1924 amounted to 500,000 tons, valued at £1,430,000, and the total value of the whole year's output, including the various by-products, was £24,389,000. By-products included sulphate of ammonia (21·1% N.), 185,000 tons (£2,257,000); anthracene (as 40% paste), 66,000 cwt (£23,000); benzol (50% liquid), 37,900,000 gall. (£1,819,000); carboic acid (60%), 28,000 cwt. (£19,000); crude naphtha, 1,812,000 gall. (£87,000); naphthalene, 191,000 cwt (£54,000); pitch, 151,000 tons (£423,000); tar oil, creosote oil and other heavy coal-tar oils, 17,132,000 gall. and 1,669,000 cwt. (£507,000); toluol (90%), 320,000 gall. and 29,000 cwt. (£25,000); other distillation products were valued at £160,000; waste heat, including gas sold, valued at £465,000; electricity sold was valued at £117,000, and all other products at £144,000. The yield of coke per ton of coal carbonised was, in 1907, 12 cwt., but increased in 1924 to practically 13½ cwt. In 1907 18% of the coke ovens in use were by-product ovens and 78·5% were beehive ovens, whilst in 1924 the figures are reported as 75% by product ovens and 21% beehive ovens. During 1924 the quantity of coke exported was one-seventh of the quantity made in that year, and its average value f.o.b. was 32s. 6d. per ton. The net output of the works was £5,001,000, and the net output per person employed was £270 in 1924, as against £273 in 1907. In 1924 the total number of persons employed in the trade was 18,548, compared with 10,958 in 1907. The total capacity of engines at the works was returned as 76,733 h.p., and the capacity of the electric generators in the industry in 1924 was 37,264 kw.

The contrast between the movement in the value of coke and that in the value of coal is related to the greatly increased importance of the by-products obtained in the distillation of coal. In 1907 the value of the by-products represented only 7% of the gross output of coke ovens; in 1912 they represented 18%, and in 1924 31% of the gross output. In 1907 a ton of foundry coke had an average sale value at the works of 16s. 9d., and the by-products obtained per ton of coke were worth, on the average, 1s. 3d., making a total of 18s. In 1924 a ton of foundry coke had an average value of 26s. 4d., and the by-products obtained per ton of coke were worth 11s. 9d., making a total of 38s. 1d., or an increase of 111½%.

In the Report on the First Census the tar produced for sale amounted to 0·6% in weight of the coal carbonised; in 1912 it amounted to about 1½%, and in 1924 it was over 2½% of the corresponding weight. The value per ton of the tar sold in 1924 was nearly 3½ times that shown in the 1907 records. Whereas the sale of tar in 1907 added little more than 1% to the proceeds of the sale of coke, in 1912 the addition was 8½%.

From the point of view of sale value, sulphate of ammonia was the most important of the by-products both in 1907 and in 1924. In the former year it added 4·4% to the value realised from the coke made; in 1924 the addition was 13·4%. The weight of sulphate of ammonia produced was, in 1907, about one-sixth of 1% of the weight of the coal used; in 1924 it was 1% of the weight of the coal. The value per ton recorded for sulphate of ammonia disposed of by coke works in 1907 was about £11 5s., and in 1924 about £12 4s.

In order of importance benzol ranks next to sulphate of ammonia, and the output reported at coke ovens in 1907 was little more than one-ninth of a gallon per ton of coal carbonised. In 1912 the average yield was four times that of 1907, and in 1924 the average was about 2 gallons per ton of coal, or between four and five times that of 1912. The average value was 5d. per gallon in 1907 and 1s. per gallon in 1924.

The output of tar oil, creosote and other heavy tar oils in 1907 was about 5 gallons per 100 tons of coal carbonised; in 1912 it was not far from four times this amount, and in 1924 it was about 90 gallons per 100 tons of coal. In 1907 the average value of these oils was under 3d. per gallon, and in 1924 about 7d. per gallon.

With a somewhat smaller amount of coal carbonised in 1924 than in 1907 the pitch recovered was thirty times as much, and the value of 24s. per ton of 1907 is replaced by an average value of 56s. per ton in 1924.

In contrasting the yield of coke and of the leading by-products of coal distillation in 1924 with that obtained in 1907 the possible differences in the average quality of the coal carbonised must not be ignored. It is obvious, however, that the main feature calling for attention is the alteration in practice, indicated both by the difference in the type of oven used and by the greater recovery of products which were mainly wasted in 1907.

MANUFACTURED FUEL

During the year 1924 the quantity of manufactured fuel produced amounted to 1,271,000 tons, valued at £1,774,000, and in 1907 the amount totalled 1,670,000, valued at £1,205,000. Exports were 1,067,000 tons, valued at £1,549,000, representing about 84% of the total quantity manufactured in the year. In 1907 exports amounted to 1,481,000 tons, valued at £1,092,000, being 89% of the quantity made in that year. Only a very small quantity of manufactured fuel was imported in either year. The net output of the factories in the trade was £401,000, and the net output per person employed was £239 in 1924, and £174 in 1907. The number of persons employed in 1924 and 1907 respectively was 1,675 and 1,537. The total capacity of engines during 1924 was 8,442 h.p., against 5,344 h.p. in 1907. The capacity of electric generators for the same periods respectively was 1,983 kw., and 239 kw.

REVIEW

THE UNITED STATES OIL POLICY. By Prof. J. ISE, Ph.D., LL.B. Pp. x + 547. New Haven: Yale University Press; London: H. Milford, Oxford University Press, 1926. Price 35s. net.

One would naturally expect that a serious book such as "The United States Oil Policy," written by Prof. John Ise, would be well worth perusing, and in that one is not disappointed. If there were nothing else in that book but the history of petroleum in the United States, from the early days of 1859 up to date, these chapters alone would be worth the production of the book, but the chapters on "Waste of oil," and "Waste of capital and energy," are outstanding features, and should really form a monumental lesson to the exploiters not only of oil, but of any other natural resources.

The book is replete with interesting details. Chapters are devoted to the discussion of the various laws governing the disposition and leasing of the Public and Indian oil lands, and all the chapters are plentifully annotated with references.

Professor Ise is, however, professionally engaged in lecturing on economics in the University of Kansas, and the whole book has, of course, been written from the politico-economic point of view. The purpose for which it has been written is the curtailment of waste of oil in the present generation for the sake of conservation of oil for future generations. With that laudable sentiment one cannot, of course, quarrel, but it is a very mute question whether Government interference in restriction of trade can ever be the panacea. However private ownership may have erred in the past, private enterprise, with all its muddling from the point of view of the politico-economist, can never equal the "trust"-like immobility of a Government Department. One need only recollect that the State Government attempted in 1914 to curtail the exploitation of the Cushing field by a shut-down order. That order became abortive in results, and the politico-economist found that ordinary economic laws are more powerful, and that artificial price structures are stupid and untenable.

If a Government could prevent drilling altogether, there might be some chance of conserving the oil not broached, but to shut down a field which has already been pierced by the drill is very risky and of doubtful utility, as the loss of gas pressure, the amount wasted by seepage to other strata, and water flooding from both below and above the surface may be doing more incalculable damage than overproduction.

The Swan Song of Prof. Ise throughout the book is that oil is being sold too cheaply, and that over-production is the reason of the oil being sold at a cheaper price than oil is actually worth. The late Lord Bearstead lately expressed the whole question of prices and supply and demand by saying that "an article is worth what it will fetch." However much Prof. Ise may bemoan the cheapness of oil, he must not forget that the almost phenomenally speedy development of the United States industrially was in no immeasurable degree due to that cheap oil, and were it not for cheap fuel at the commencement of an industry the industry could not have grown with such rapidity.

In that respect, therefore, one cannot agree that

"cheapness of oil was unfortunate." Cheap liquid fuel has enabled the United States to develop its railway systems and has enabled it to carry railway tracks over arid wastes where probably no other fuel existed or was obtainable. To the existence of cheap fuel is due that development of motor transportation in the United States which the author himself says "was the most rapid and spectacular economic development in all history." The development of the motor industry has meant phenomenal development of subsidiary and supplemental industries, since the motor industry requires as raw materials steel, copper, aluminium, leather, upholstery fabrics, rubber, glass, etc. Cheap fuel, which enabled the motor industry to develop like that, is probably the principal cause of highway improvements, the boasted efficiency of the American business man, and there is no doubt that that same cheap fuel has caused a considerable revolution and change in the economic life of the citizens of the U.S.A.

Natural resources are not the only riches of a country, and if by means of the use of some of the natural resources a country can conserve the greatest of all riches, and that the man-power, the utilisation of such inanimate natural resources should be an off-set against any "waste" of such a commodity, and Prof. Ise's objection as "waste" to the uses of powerful motor cars by "Fat-bellied Bankers" and for the joy rides of the Bourgeoisie, are mere academic complaints.

A further waste of oil which Prof. Ise draws attention to is the waste of fuel which is being burned under boilers in ships. Here too, this "waste" is the interregnum stage of development. Industrially, there can be no question that oil fuel on board ship represented a stage of higher development as compared with the old low-pressure coal-fired boiler, and the scientist, striving for efficiency, has realised that fuel oil can be more economically used, and with greater efficiency in an internal combustion engine, whilst the use of oil in internal combustion engines, which, so far as we have gone at present, is the most economical use of oil, is developing rapidly, and more and more ships are fitted with this latest development in prime movers. We would have never reached this stage if it had not been for "cheap" fuel.

One has seen it stated so often that when prices rule high, governed as they probably are by economic laws of supply and demand, people complain of profiteering, and when the same laws cause a fall in prices people say that this is proof that prices had no business to have been up. If one is to condemn profligacy then despondency should merit the same condemnation, and, judging by the prophecies of the various authorities, the United States is in no imminent danger of having to depend upon outside sources for a great number of years.

On the whole Prof. Ise is to be congratulated on a very studious and painstaking work.

COMPANY NEWS

BRUNNER, MOND AND CO., LTD.

The Rt. Hon. Sir Alfred Mond, Bt., M.P., presiding over the annual meeting held on March 29, stated that the reduced gross profit shown in the accounts was due to the facts, first, that the balance sheet was for a nine

months' period, and, secondly, to the loss from the long-continued coal strike. The coal strike had meant a difference of £500,000 to the company in increased cost of fuel and decreased trade. In this connexion, the company raised its prices slightly in agreement with its customers, but it carried the greater part of the burden in continuing its works on imported coal. It did this because it regarded it as its duty, both to the industries of the country and to its customers, to continue production even under such very unfavourable circumstances. There was an increased revenue from investments which partly compensated for the reduction in trading profits. Also, in spite of the bad year, £150,000 had been placed to depreciation, against £200,000 for the previous year. The new works at Wallerscote, the completion of which had been delayed by the strike, were now operating successfully. Dividends were declared for the nine months ended December 31, 1926, as follows. To the holders of preference shares at the rate of $7\frac{1}{2}\%$ per annum, less income tax and less the interim dividend paid in December last, and to the holders of preference shares at the rate of $7\frac{1}{2}\%$ per annum, less income tax and less the interim dividend paid in December last.

BRITISH ALUMINIUM CO., LTD.

The seventeenth ordinary general meeting, held on March 31, was presided over by Major R. W. Cooper, who said that Mr. A. W. Tait, the chairman of the company, was absent through ill-health, and the vice-chairman, Colonel S. H. Pollen, was abroad. The net profit for 1926 was £438,776, against £550,434 for 1925, the increased costs of operation arising from the general strike and the coal strike accounting for the reduced amount. In certain directions there were satisfactory developments in the demand for the company's products, one being the use of aluminium for electrical conductors, with the result that the electrical industry was becoming one of the more important outlets for the metal. The total weight of aluminium sold for such purposes last year exceeded that of any previous year, and was double that of 1925. Other favourable developments were the use of aluminium for marine work, and the increasing use of alloys for pistons and cylinder heads of motor engines. Further, the properties of aluminium for cooking and other domestic utensils were more widely recognised than ever. Extended uses of the metal and its alloys demanded unremitting attention to metallurgical research and experiment, and the present high standard of the metal must be maintained by continual watchfulness and skill on the scientific, as well as on the productive, side of the industry. Further additions had been made to buildings and plant, the chief expenditure being on extensions of the Burretsland alumina factory and at the rolling mills.

STEWARTS AND LLOYDS, LTD.

The thirty-seventh ordinary general meeting, held on March 31, was presided over by the chairman, Mr. A. C. MacDiarmid. Towards the end of 1925 the iron and steel trade of the country appeared to be emerging from the long and difficult period through which it had been passing since the collapse of the post-war boom, but the hopes entertained at the last meeting were shattered by the general strike and the coal stoppage. During the period May to December

the company's collieries, ore fields, blast furnaces, steel works and some of its tube works were almost entirely shut down. The directors decided that, in spite of the difficulties, the right policy was to carry on the production side of the business as far as was feasible, and the company was successful in keeping a number of its principal tube plants working fairly regularly during the whole period. The direct loss inflicted upon the company by the strike was estimated at £300,000. Despite these difficulties, the volume of tubes made and sold during 1926 was within a few tons of the turnover of 1925, the record year for production. Intensive and successful work was being carried on with the object of developing and opening up existing and new markets and sources of demand. The works were now fairly well employed, the sales for the first part of this year exceeding previous returns for a similar period. The appropriation of the profits made during the year was on conservative lines, and the carry-forward was increased by £11,000. The company had acquired for a small sum a quarter share in a company called the Nascent Carbon Metal Co., formed to acquire and develop the patents of Mr. H. Edwin Coley. Mr. Coley had discovered a method of extracting certain metals from their ores at a greatly reduced cost, and the company had erected a plant on a commercial scale at its Coombs Wood works, the results obtained proving that the discovery may be one of great value. A scheme had been instituted enabling the staff and workmen to purchase and hold, on easy terms, deferred shares of the company, the number of shares now held, or in course of being subscribed for, amounting to 48,427, divided among 2,180 subscribers.

UNITED GLASS BOTTLE MANUFACTURERS, LTD.

The net profits for 1926 totalled £39,709 (against £100,552 for 1925), and with £11,353 brought in and £17,103 provision for taxation etc. not now required, there was an available balance of £98,165. After again providing £15,000 as special depreciation in respect of capital reorganisation and placing £3,557 to the staff benevolent fund, the directors have provided for the year's preference dividend, and propose to carry forward the increased balance of £43,622. Mr. G. E. Alexander, O.B.E., for many years managing director of the company, has been elected to occupy the dual position of chairman and managing director.

BRITISH OIL AND CAKE MILLS, LTD.

A trading profit is recorded for 1926 of £251,518, which, with £38,144 interest, £374,506 dividends on investments, and transfer fees, makes a total of £664,496. After making all charges, the net balance is £218,037, compared with £188,422 for 1925. With £113,750 transferred from preferential dividend reserve and £33,619 brought in, there is available £365,406. A dividend of 10%, less tax, is proposed on the preferred ordinary shares ($2\frac{1}{2}\%$ for 1925), and £33,633 will be carried forward.

ANGLO-PERSIAN OIL CO., LTD.

At 5% actual, the interim dividend for the year to March 31, 1927, is the same as that for the preceding year, but is payable on the capital increased by the 50% capitalised bonus distributed in November last.

DUNLOP RUBBER CO., LTD.

The profits for 1926, after providing for depreciation, amounted to £2,711,418 (against £3,207,611 for 1925), and were struck after allowing for the dividend on the preference shares of No. 2 D.R. Cotton Mills absorbing £97,500. A dividend has been recommended of 20%, being an increase of 5% over the previous year. It is proposed to place £500,000 to reserve, leaving £665,000 to be carried forward, compared with £593,091 brought in. The trading was adversely affected by the coal strike, the increased expenditure on coal and power alone exceeding £100,000.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LTD.

The twenty-eighth ordinary general meeting was held on April 1, Mr P. Malcolm Stewart, chairman, presiding. After briefly reviewing the company's widespread interests, the chairman said that since the meeting in 1925 when emphasis was placed on the necessity for improving the earning capacity of the fixed assets by modernising the largest works, they had created at Bevan probably the finest cement works in Europe, with a present annual capacity of 375,000 tons, and with cement shipping facilities second to none in the world. In addition, the chamber kilns at the Crown works had been replaced by a rotary kiln plant, and both the Bevan and Crown factories were running smoothly and producing cement of excellent quality at a low cost of manufacture. With the completion of the reconstruction now commenced, of the Swancombe works, the company will have an annual productive capacity exceeding 1,250,000 tons from efficient rotary kiln plant. Despite the dislocation of business brought about by the coal stoppage, the company's sales organisation was successful in selling in the home market a larger tonnage of cement than ever previously accomplished. It was evident that the extensive propaganda undertaken by the company during the last few years in showing the advantages of concrete for constructional purposes was bearing fruit. Regarding the prospects for the current year, the demand was well up to expectations for the spring period, and the factories were on full time.

TAR RESIDUALS, LTD.

This company, which has just been registered, consists of an amalgamation of the tar products business of Messrs Simon Carves, Ltd., 20, Mount Street, Manchester, with Messrs. Walter Waugh & Co., Ltd., of London, and Messrs. Walter H. Brown & Co., Ltd., of London. The new business will be carried on in the same manner and under the same management as the old, three directors of each company constituting the board. The London office of Tar Residuals, Ltd., will be at 4, Lloyd's Avenue, and the Manchester office at 20, Mount Street.

RIO TINTO CO., LTD.

This big copper and sulphur mining concern will maintain the dividend at 50%, for the year, by making a final payment of 30s. per share on the ordinary capital of £1,875,000. The gross profit for 1926 was £1,400,789, the net profit being £1,041,046 (excluding £150,000 transferred from taxation suspense account), compared with £1,457,627 and £1,027,190, respectively, for 1925. After placing £500,000 to reserve, making that fund £1,000,000, the sum of £153,449 will be carried forward.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial—Cryst., £34 per ton; **Powder,** £36 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali—£6 15s. per ton, f.o.r. Special terms for contracts.
Bisulphite of Lime—£7 19s. per ton, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; **Contract,** £8 10s. per ton d/d., 4 ton lots.
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; **Granulated,** £19 per ton; **Powder,** £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5 12s. 6d.—£5 17s. 6d. per ton, carr. paid.
Copper Sulphate.—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; **Pyridinised Industrial,** 2s. 7d.—3s. per gal.; **Mineralised,** 3s. 6d.—3s. 10d. per gal., 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. **Potass. Bichromate.**—4½d. per lb. **Potass. Chlorate.**—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammoniac.—£45—£50 per ton. **Chloride of ammonia** £37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. **Sod. Bicarbonate (refined).**—£10 10s. per ton, carr. paid. **Sod. Bichromate.**—3½d. per lb. **Sod. Bisulphite Powder 60/62%.**—£17 per ton, home market, 1-cwt. iron drums included. **Sod. Chlorate.**—2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.r. London, casks free. **Sod. Sulphate (Glauber's Salt).**—£3 12s. 6d. per ton. **Sod. Sulphide conc. solid 60/65.**—Spot £13 5s. per ton, contracts £13 carr. paid. **Sod. Sulphide cryst.**—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. **Sod. Sulphite, Pea Cryst.**—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6d.—1s. 5½d. per lb., according to quality.
Crimson.—1s. 3d.—1s. 7½d. per lb., according to quality.
Arsenic, Sulphide, Yellow.—2s. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£46—£55 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 2d. per lb.
Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
Lamp Black.—£35 per ton, barrels free.
Lead Hyposulphite.—9d. per lb.
Lithophone, 30%.—£22 10s. per ton.
Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity
Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.

Sulphur Chloride.—4d. per lb., carboys extra.

Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.

Thiocarbanilide.—2s. 1d.—2s. 3d. per lb., according to quantity.

Vermilion, pale or deep.—5s. 3d. per lb.

Zinc Sulphide.—1s. 1d. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 5s. per ton. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.

Charcoal.—£7—£10 per ton, according to grade and locality.

Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.

Red Liquor.—9d.—1s. 16° Tw. per gal.

Wood Creosote.—1s. 9d. per gal., unrefined.

Wood Naphtha.—Miscible, 4s. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P.

Wood Tar.—£4—£5 10s. per ton and upwards, according to grade.

Brown Sugar of Lead.—£41—£42 per ton.

TAR PRODUCTS

Acid Carbohc.—Crystals, 7½d. per lb. Crude 60's, 1s. 8d. 1s. 9½d. per gal.

Acid Cresylic, 99/100.—2s. 4½d.—2s. 6½d. per gal. Steady, 97/99.—2s.—2s. 2d. per gal. Pale, 95%, 1s. 10d. 2s. 2d. per gal. Dark, 1s. 9d.—2s. per gal.

Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.

Benzole.—Crude 65's, 1s. 2½d.—1s. 3½d. per gal., ex works in tank wagons; Standard motor, 1s. 9d.—2s. 4d. per gal., ex works in tank wagons; Pure, 2s.—2s. 1d. per gal., ex works in tank wagons

Toluole.—90%, 2s. 1d. to 2s. 2d. per gal. Firm. Pure, 2s. 3d.—2s. 4d. per gal.

Xylol.—2s. 1d.—2s. 2d. per gal. Pure, 3s. per gal.

Creosote.—Cresylic 20/24%,—10½d. per gal. Standard specification, 6½d.—9d. per gal. Middle Oil, 7½d.—8d. per gal. Heavy, 8½d.—9d. per gal. Salty, 7d. per gal., less 1½%.

Naphtha.—Crude, 9d.—9½d. per gal., according to quality. Solvent 90/160, 1s. 8d.—2s. 1d. per gal. Solvent 95/160, 1s. 8d.—1s. 9d. per gal. Solvent 90/190, 1s. 4d. per gal.

Naphthalene Crude.—Drained Creosote Salts, £8 per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.

Naphthalene.—Crystals.—£13 10s. per ton. Quiet. Flaked, £12 10s.—£13 per ton.

Pitch, medium soft.—90s.—95s. per ton, f.o.b. according to district. Nominal.

Pyridine.—90/140.—9s. 6d.—10s. per gal. Nominal. 90/180—5s. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—8s. per lb.

Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.

Acid H.—3s. 3d. per lb. 100% basis d/d.

Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.

Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.

Aniline Oil.—7d. per lb., naked at works.

Aniline Salts.—7d. per lb., naked at works.

Anthranilic Acid.—6s. per lb. 100%.

Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—4d. per lb. Fair enquiry.

m-Cresol 98/100%.—2s. 8½d. per lb. Only limited enquiry.

p-Cresol 32/34° C.—2s. 8½d. per lb. Only limited enquiry.

Dichloraniline.—2s. 3d. per lb.

Dimethylaniline.—2s. per lb. d/d. Drums extra.

Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.

Dinitrochlorbenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

α-Naphthol.—2s. per lb. d/d.

β-Naphthol.—11d.—1s. per lb. d/d.

α-Naphthylamine.—1s. 3d. per lb. d/d.

β-Naphthylamine.—3s. per lb. d/d.

p-Nitraniline.—1s. 9d. per lb. d/d.

m-Nitraniline.—3s. per lb. d/d.

o-Nitraniline.—5s. 9d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb. d/d.

R. Salt.—2s. 2d. per lb. 100% basis d/d.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—7½d. per lb., naked at works.

p-Toluidine.—2s. 2d. per lb. ex works, naked.

m-Xylidine Acetate.—2s. 6d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 5d.—2s. 6d. per lb. Firm and brisk.

Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 3d. per oz.; 500 oz. lots—1s. per oz.

Acid, Boric B.P.—Cryst. £41 per ton. Powder £45 per ton. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 4½d.—1s. 5d. per lb. Less 5%. Firm.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. 1s. 3½d.—1s. 5d. per lb. Technical 11½d.—1s. per lb. Both in good demand.

Acid, Tannic B.P.—2s. 9d.—2s. 11d. per lb.

Acid, Tartaric.—1s. 2d. per lb. Less 5%. Firm market.

Amidol.—9s. per lb. d/d.

Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.

Amidopyrin.—8s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—Lump 1s. per lb. Powder 1s. 3d. per lb.

Atropine Sulphate.—11s. per oz. for English make.

Barbitone.—6s. 6d. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth

Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—

8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—

8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb.

Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Sub-

chloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—

7s. 9d.—8s. per lb. Extra and reduced prices for

smaller and larger quantities respectively; Lique-

Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—

1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—Crystal £24 per ton, Powder £25 per ton, carr. paid any station in Great Britain in ton lots.
Bromides.—Ammonium.—2s. 4d.—2s. 6d. per lb. Potassium.—2s. 4d.—2s. 6d. per lb. Sodium.—2s. 2d.—2d. 4d. per lb. All spot.

Calcium Lactate.—1s. 3½d.—1s. 4½d. per lb.
Chloral Hydrate.—3s. 2d.—3s. 5d. per lb., duty paid.
Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
Croosote Carbonate.—6s. per lb.
Ether meth.—1s. 1d.—1s. 1½d. per lb., according to sp. gr. and quantity. Ether purif. (Aether B.P. 1914).—2s. 3d.—2s. 4d., according to quantity.

Formaldehyde.—£39 per ton. Ex wharf in barrels.
Guaiacol Carbonate.—5s. per lb.
Hexamine.—2s. 4d.—2s. 6d. per lb.
Homatropine Hydrobromide.—30s. per oz.
Hydraetine Hydrochlor.—English make offered, 120s. per oz.
Hydrogen Peroxide (12 vols.).—1s. 5d. per gal. f.o.r. makers' works, naked.

Hydroquinone.—4s. per lb.
Hypophosphites.—Calcium 3s. 6d. per lb., for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron. Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—22s. per cwt., 112 lb. lots.
Magnesium Carbonate.—Light Commercial £33 per ton net.
Magnesium Oxide.—Light Commercial £67 10s. per ton, less 2½%; Heavy Commercial £22 per ton, less 2½%, in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 18s. 9d. per lb. net.
Synthetic, 11s.—12s. 6d. per lb., according to quantity.
Liquid (95%), 12s. per lb. Detached cryst., 14s. 6d. per lb.
Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig. 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.

Methyl Salicylate.—1s. 9d. per lb.
Methyl Sulphonal.—11s. per lb.

Metol.—11s. per lb. British make.
Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.
Phenacetin.—3s. per lb.
Phenazone.—4s. 6d. per lb.
Phenolphthalein.—6s.—6s. 3d. per lb.
Potass. Bitartrate.—99/100% (Cream of Tartar) 96s. per cwt., less 2½% for ton lots.

Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
Potass. Ferriyanide.—1s. 9d. per lb. in cwt. lots.
Potass. Iodide.—16s. 8d.—17s. 2d. per lb.
Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.
Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins.

Rosorcin.—4s. per lb. spot.
Saccharin.—55s. per lb. Very limited enquiry.
Safol.—2s. 4d. per lb.
Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
Sod. Ferrocyanide.—4d. per lb., carr. paid.
Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.
Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net, according to quantity.

Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal, 1s. 10d.—1s. 11d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.

Sulphonal.—7s. 6d. per lb.
Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 3d. per lb.
Thymol, Puriss.—11s. 6d.—12s. per lb., according to quantity. Natural.—14s. 9d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. 3d. per lb.
Aubepine (ex Anethole).—10s. 6d. per lb.
Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.
Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 3d. per lb.
Cinnamic Aldehyde.—Natural, 17s. per lb.
Coumarin.—10s. 6d. per lb.
Citronellol.—14s. 6d. per lb.
Citral.—8s. 3d. per lb.
Ethyl Cinnamate.—10s. per lb.
Ethyl Phthalate.—3s. per lb.
Eugenol.—9s. 6d. per lb. Geraniol (Palmarosa).—17s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Bois de Rose) 15s. per lb.—(ex Shui Oil) 10s. 6d. per lb. Linalyl Acetate.—(ex Bois de Rose) 18s. per lb.—(ex Shui Oil) 14s. 6d. per lb.
Methyl Anthranilate.—8s. 6d. per lb.
Methyl Benzoate.—4s. 6d. per lb.
Musk Ketone.—35s. per lb.
Musk Xylol.—8s. 6d. per lb.
Nerolin.—3s. 9d. per lb.
Phenyl Ethyl Acetate.—12s. per lb.
Phenyl Ethyl Alcohol.—10s. 6d. per lb.
Rhodinol.—27s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 6d. per lb. Vanillin.—18s. 6d. per lb. Good demand.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—3s. 1d. per lb. Bergamot.—30s. per lb. Bourbon Geranium.—12s. per lb.
Camphor.—67s. 6d. per cwt. Cananga, Java, 30s. per lb. Cassia, 80/85%.—8s. 6d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 2s. 3d. per lb., Ceylon, Pure, 1s. 10d. per lb. Clove, pure—6s. per lb.
Eucalyptus, 75/80%.—2s. per lb. Lavender.—Mont Blanc 38/40%, 21s. per lb. Lemon.—10s. 6d. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb. Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 70s. per oz., Palma Rosa.—9s. per lb. Peppermint.—Wayne County, 19s. 3d. per lb. Japanese, 8s. 6d. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood.—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than May 28th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on April 14th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Baxter, Bruce, and Cox, Ltd. Method of subdivision of colloid or plastic materials. 8378. Mar. 26.
Bentley, Coates, and Riley & Sons. Manufacture and treatment of colloidal materials. 7975. Mar. 23.

British Furnaces, Ltd. (Surface Combustion Co.). Furnaces etc. 7940, 7942, 8072-4. Mar. 22 and 23.

Calder. 7889. See XXIII.

L.-G. Farbenind. Drying agent for gases. 8303. Mar. 25. (Ger., 7.6.26.)

Parker, and Vickers, Ltd. Rotary drying and cooling cylinders. 8032. Mar. 23.

Smith (Surface Combustion Co.) Furnaces etc. 7940 and 7942. Mar. 22.

I.—Complete Specifications

4389 (1926). McGowan and Hunter. Emulsifying apparatus. (267,681.)

8844 (1926). Ljungstrom. Furnaces. (267,723.)

12,153 (1926). Soc. L'Air Liquide. Apparatus for bringing liquids and gases into contact. (262,042.)

19,251 (1926). Crossman. See II.

28,538 (1926). Simpson. Mixing-machine. (267,840.)

29,253 (1926). Union A.-G. für Metallind. Centrifugal separators. (262,096.)

31,439 (1926). Alexander. Apparatus for purifying liquids centrifugally. (267,858.)

II. Applications

Bamber. Gas-producers. 8174. Mar. 24.

Barker (Cunningham) Mechanically-operated gasanalysers. 8196. Mar. 24.

Burmah Oil Co., Ltd. (Allan and Moore). Wax sweating and crystallising apparatus. 8358. Mar. 26.

Calder. 7889. See XXIII.

Easton and Henneage. Fuels for gas-producer plants. 8271. Mar. 25.

Fairweather (Amer. Coalfield Corp.). Fuel. 7905. Mar. 22.

Groné. Converting heavy hydrocarbons into light hydrocarbons. 7750. Mar. 21.

Humphreys & Glasgow, Ltd. Purification of gas. 8376. Mar. 26. (U.S., 24.6.26.)

Johnson (L.-G. Farbenind.) Production of fuel gases. 7920. Mar. 22.

Jones. Fuel for internal combustion engines etc. 8027. Mar. 23.

Koppers Co. Manufacture of coal products. 8268. Mar. 25. (U.S., 25.3.26.)

Misch. Generating gas. 7776. Mar. 21.

Northrup. Conversion of heavy petroleum oils into lighter oils. 7742. Mar. 21.

Stanciliffe. Apparatus for distilling and cracking oils. 8121. Mar. 24.

Sutcliffe. Apparatus for distillation of coal etc. 8386. Mar. 26.

II. Complete Specifications

4747 (1926). L.-G. Farbenind. Manufacture of articles from molten carbon. (254,679.)

9244 (1926). Travers and Clark. Manufacture of gas (267,724.)

12,461 (1926). Allgem. Ges. f. Chem. Ind. Refining mineral oils with liquid sulphur dioxide. (267,071.)

18,114 (1926). Soc. Luxembourgeoise des Hydrocarbures, and Brimeyer. Cracking oils and tars. (267,776.)

19,251 (1926). Crossman. Drying-apparatus for briquettes etc. (267,784.)

*26,226 (1926). Still. Coke ovens. (267,881.)

*5567 (1927). Smeets-Solvay Co. By-product coke ovens. 267,906.)

*7474 (1927). Stransky and Hansgig. Cracking hydrocarbon oils or their distillates. (267,958.)

*7475 (1927). Stransky and Hansgig. Refining low-boiling distillates of hydrocarbon oils. (267,959.)

III.—Complete Specification

18,114 (1926). Soc. Luxembourgeoise des Hydrocarbures, and Brimeyer. See II.

IV.—Applications

L.-G. Farbenind. Substituted aromatic sulphonic acids. 8146. Mar. 24. (Ger., 7.4.26.) Manufacture of alkylated etc. arylsulphonic acids. 8285. Mar. 25. (Ger., 27.3.26.)

Johnson (L.-G. Farbenind.). Production of vat dyestuffs. 8138. Mar. 24.

IV.—Complete Specifications

4843 (1926). Soc. Chem. Ind. in Basle. Manufacture of intermediate products and dyestuffs of the anthraquinone and anthracene series. (249,480.)

12,143 (1926). L.-G. Farbenind. Manufacture of condensation products of the anthraquinone series. (252,029.)

*7322 (1927). L.-G. Farbenind. Manufacture of condensation products from aromatic hydrocarbons etc. (267,940.)

V.—Applications

Brandwood. Application of artificial silk coatings to yarns. 8214. Mar. 25.

Rimman. Producing cellulose etc. from straw, esparto, etc. 8029. Mar. 23. (Sweden, 7.4.26.)

Silberad. Manufacture of artificial filaments. 7989. Mar. 23.

Soc. Chem. Ind. in Basle. Manufacture of artificial threads. 8147. Mar. 24. (Switz., 24.3.26.)

Soc. Chim. Usines du Rhône. Apparatus for manufacture of cellulose acetate. 8170. Mar. 24. (Fr., 10.5.26.)

V.—Complete Specifications

28,990 (1925). Eichenbrun. Production of artificial silk, filaments, etc. (213,350.)

31,689 (1925). British Enka Artificial Silk Co. Manufacture and use of artificial silk etc. (244,496.)

4113 (1926). Pellerin. Manufacture of a cellulose product having the appearance of wool. (263,727.)

VI.—Applications

Clavel. Weighting natural silk. 8148. Mar. 24.

Durand & Huguenn. A.-G. Dyeing animal fibres. 7939. Mar. 22. (Ger., 22.3.26.)

Hadfield and Hadfield. Treating textile yarns etc. 7713. Mar. 21.

L.-G. Farbenind. Dyeing mixed textile goods. 7938. Mar. 22. (Ger., 22.3.26.)

Soc. Anon. Etabl. Petitdhier. Colour printing on fabrics. 8270. Mar. 25. (Fr., 7.5.26.)

VI.—Complete Specifications

1528 (1926). L.-G. Farbenind. Obtaining fast discharges on fast dyes. (246,183.)

5382 (1926). Johnson (L.-G. Farbenind.). Dyeing and printing cellulose esters. (267,695.)

*7060 (1927). L.-G. Farbenind. Treatment of fibres etc. (267,924.)

*7458 (1927). Durand & Huguenn. Products for dyeing or printing. (267,952.)

*7938 (1927). L.-G. Farbenind. Dyeing mixed textile goods. (267,985.)

*7939 (1927). Durand & Huguenn. Dyeing animal fibres. (267,986.)

VII.—Applications

Andreas. 8254. See IX.

Carpmael (L.-G. Farbenind.). Absorbing ammonia etc. from gases. 7786. Mar. 21.

Holzverkohlungs-Industrie A.-G. Concentrating raw pyro-ligneous acid. 8300. Mar. 25. (Ger., 25.5.26.)

VII.—Complete Specifications

8381 (1926). Toniolo. Manufacture of nitric acid (267,721.)

12,638 (1926). L.-G. Farbenind. Utilising residue obtained in reduction of molten crude phosphates. (252,367.)

*20,797 (1926). Petersen. Manufacture of sulphuric acid. (267,885.)

*5571 (1927). Bachmann. Producing active silicic acid. (267,907.)

*6107 (1927). Dupire. *See* XI.

*7657 (1927). Mulliez Frères et Cie. *See* IX.

VIII.—Application

Hartford-Empire Co. Glass furnaces. 7888 and 7890. Mar. 22. (U.S., 6.4.26 and 3.8.26.)

VIII.—Complete Specifications

23,731 (1926). Gen. Electric Co., Ltd. Readily fusible glasses and enamels. (267,815.)

32,848 (1926). Bicheroux. Manufacturing raw plate glass. (263,847.)

IX.—Applications

Andreas. Burning cement, lime, etc. 8254. Mar. 25. (Ger., 31.3.26.)

Gunn. Preserving wood etc. 8234. Mar. 25.

Parker, and Vickers, Ltd. Rotary cement kilns. 8034. Mar. 23.

IX.—Complete Specifications

22,842 (1925). Universal Rubber Pavoirs, Ltd., and Brown. Bituminous mixtures for roads. (267,317.)

29,113 (1925). Bubla. Apparatus for impregnating wood. (267,579.)

*7393-4 (1927). Ackermann, and Scheidhauer & Giesing A.-G. Manufacture of bricks. (267,949.)

*7057 (1927). Mulliez Frères et Cie. Manufacture of lime or cement products and the like. (267,971.)

X.—Applications

Brownson, and Kynoch, Ltd. Annealing metal. 8262. Mar. 25.

Coley. Reduction of ores etc. 7898. Mar. 22.

I.-G. Farbenind. Refining iron. 8354. Mar. 26. (Ger., 1.4.26.)

Ireland. Iron alloy. 8065. Mar. 23.

Kelly. Silver alloys. 8305. Mar. 25.

Smith (Naam. Vennoots. Elementenfabr. Utrecht Battery Co.). Coating metals etc. with dissimilar metals etc. 8298. Mar. 25.

Stimson. Treatment of ores. 7831. Mar. 22.

X.—Complete Specifications

23,145 (1925). Greff. Smelting oolitic ores and slimes. (240,165.)

29,436 (1925). Molybdenum Corp. of America. Compositions for alloying molybdenum with other metals. (245,422.)

33,008 (1925). Bracy. Furnaces for roasting sulphide and other ores. (248,711.)

4776 (1926). Kuehnrich. Heat-treatment of alloy steels. (267,687.)

9089 (1926). Krupp Grusonwerk. Working-up ores etc. containing volatilisable metals. (252,679.)

10,220 (1926). British Thomson-Houston Co. Protecting metals against oxidation at high temperatures. (250,975.)

14,335 (1926). Metallbank u. Metallurgische Ges. Desulphurising fine iron pyrites. (254,691.)

18,515 (1926). Krupp Grusonwerk. Extraction of lead and zinc from ores etc. (256,601.)

*7532 (1927). Piwowarsky and Oberhoffer. Production of technical alloys of diverse structural condition and properties. (267,964.)

*7665 (1927). Corsalli. Melting metals. (267,972.)

*7315 (1927). Piwowarsky and Oberhoffer. Production of high-grade iron or steel. (267,939.)

XI.—Application

Metter. Lead accumulators. 8176. Mar. 24. (Ger., 20.3.26.)

XI.—Complete Specifications

31,494 (1925). Leitner. Electric accumulators. (267,588.)

31,250 (1926). Internat. General Electric Co., Inc. Electric furnaces. (262,796.)

*6107 (1927). Dupire. Apparatus for electrolysing alkali chlorides etc. (267,912.)

XII.—Application

Soc. Anon. Anc. Etabl. Pellerin. Apparatus for melting fatty substances. 8082. Mar. 24. (Fr., 22.4.26.)

XII.—Complete Specification

*7164 (1927). Sorensen. Treating crystallised margarine mass. (267,928.)

XIII.—Complete Specifications

32,304 (1925). Whatmough. Manufacture of carbon black pigments. (267,625.)

32,456 (1925). Bloxam (I.-G. Farbenind.). Manufacture of writing-inks. (267,033.)

11,107 (1926). Marks (Bakehte Corp.). Potentially reactive liquid coating-compositions. (267,736.)

19,501 (1926). Marks (Irwin and Monk). Titanium pigments. (267,788.)

*5171 (1927). Kunstharzfabr. Pollak. Manufacture of phenol-formaldehyde condensation products. (267,901.)

XIV.—Applications

Chem. Fabr. Kalk, and Oehme. Vulcanisation of rubber. 7700. Mar. 21. (Ger., 21.6.26.)

Hayes, Klein, McKay, Szegvári, and Trobridge. Production of rubber articles from aqueous dispersions of vegetable resins. 8399. Mar. 26.

XIV.—Complete Specifications

21,798 (1926). Carpmacel (I.-G. Farbenind.). Removal of liquid polymers from synthetic rubber. (267,808.)

22,526 (1926). Naugatuck Chem. Co. Vulcanisation accelerators. (259,933.)

XV.—Applications

Arnot. Manufacture of adhesives. 8375. Mar. 26.

Baxter, Bruce, and Cox, Ltd. 8378. *See* I.

Ehrenreich. Treatment of shark skins etc. 8190 I. Mar. 24. (Belg., 24 and 25.1.27.) Preparatory treatment of fish skins. 8192. Mar. 24. (Belg., 26.1.27.) Process for obtaining glue. 8193. Mar. 24. (Belg., 31.1.27.)

Roberts. Leather manufacture. 7788. Mar. 21.

Weber. Mineral tanning etc. 7783. Mar. 21.

XIX.—Application

Peyton. Preservation of meat. 8381. Mar. 26.

XIX.—Complete Specification

*7164 (1927). Sorensen. *See* XII.

XX.—Applications

Carpmacel (I.-G. Farbenind.). Obtaining perfumes. 7784-5. Mar. 21. Manufacture of elastic preparations of pharmaceutical products. 8299. Mar. 25.

May & Baker, Ltd., and Newbery. Manufacture of oxyacetic acid derivatives of arylarsenic compounds. 8017. Mar. 23.

XX.—Complete Specifications

15,398 (1926). Johnson (I.-G. Farbenind.). Manufacture of concentrated solutions of formaldehyde or paraformaldehyde. (267,768.)

21,196 (1926). Consort. f. Elektrochem. Ind. Manufacture of acetals. (257,622.)

26,407 (1926). Soc. Chem. Ind. in Basle. Manufacture of aldehyde condensation products. (260,288.)

*1766 (1927). Naef et Cie. Increasing the yield in civetone from civet. (267,893.)

*7061 (1927). I.-G. Farbenind. Production of aldehydes. (267,925.)

*7460 (1927). Rupe. Manufacture of unsaturated aldehydes. (267,954.)

XXI.—Applications

Bawtree. Photographic image. 8391. Mar. 26.

Chem. Fabr. van der Grinten, and Grinten. Manufacture of photographic sensitive layers. 8071. Mar. 23. (Holland, 11.12.26.)

XXIII.—Application

Calder. Treating water, oil, etc. 7789. Mar. 22.

XXIII.—Complete Specifications

*24,731 (1926). California Fruit Growers' Exchange. Insecticides and fungicides. (267,878.)

*7595 (1927). Du Pont de Nemours & Co. Disinfectants. (267,968.)

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number. *Brazil*: Tinplate, galvanised iron sheets, structural iron and steel (339). *British India*: Steel rails, electro copper wire bars (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Structural Steel* (Directors of the South Indian Railway Company, 91, Petty France, Westminster, S.W.1). *Czechoslovakia*: Lead and antimony (A.X. 4459). *Egypt*: Liquid asphalt (B.X. 3375). *France*: Tinplate,terne plates (328). *Holland*: Galvanised hollow-ware and sheets (333). *New Zealand*: Aluminium hardware (321). *South Africa*: Copper pipes (A.X. 4474). Charcoal iron or anti-corrosive steel boiler tubes (A.X. 4471); Hides (B.X. 3390); Cast-iron pipes (A.X. 4470 and A.X. 4467).

Safeguarding of Key Industries

The Board of Trade give notice that representations have been made to them under Section 10 (5) of the Finance Act, 1926, regarding the following articles: Dial (acid di-allyl barbituric); Elbon (cinnamoyl para-oxyphenylurea); Integrators (planimeter type); R Lead acetate; Liponodin (ethyl di-iodo brassidate); Phytin (calcium magnesium inositol hexaphosphate); Planimeters.

Section 10 (5) of the Finance Act, 1926, is as follows:

"The Treasury may by order exempt from the duty imposed by section one of the Safeguarding of Industries Act, 1921, as amended by this Act, for such period as may be specified in the order, any article in respect of which the Board of Trade are satisfied on a representation made by a consumer of that article that the article is not made in any part of His Majesty's Dominions in quantities which are substantial having regard to the consumption of that article for the time being in the United Kingdom, and that there is no reasonable probability that the article will within a reasonable period be made in His Majesty's Dominions in such substantial quantities."

Any person desiring to communicate with the Board of Trade with respect to these applications should write to the Principal Assistant Secretary, Industries and Manufactures Department, Board of Trade, Great George Street, S.W.1, within two months from the date of this notice. (March 30, 1927.)

Merchandise Marks Act, 1926. (Applications for Marking of Goods: Reference to Standing Committee)

In accordance with the provisions of Sub-section 4 of Section 2 of the Merchandise Marks Act, 1926, the Board of Trade announce that in pursuance of appli-

cations received by them for the making of Orders in Council to require imported goods of certain classes and descriptions to bear an indication of origin, they have made a reference to the Standing Committee appointed by the Board under the Act in respect of the following classes and descriptions of goods:—(1) (a) The following descriptions of steel:—Plates, rails, joists, angles, channels, sectional material of all descriptions, castings, forgings, rounds, squares, flats, hexagons, hoops, hot and cold rolled strip. (b) The following descriptions of wrought iron:—Bars, hoops, sections, plates and sheets. (2) Silk and cotton woven labels; and (3) Gold and silver leaf. The Standing Committee will begin their inquiry with regard to the classes and descriptions of goods specified above at 2 p.m., on Monday, April 25, in Room 74A (First Floor), New Public Offices, Great George Street, London, S.W.1. Further meetings of the Committee will be held at the same place on April 26 and 27. The Secretary of the Committee is Mr. E. W. Reardon, New Public Offices, Great George Street, S.W.1.

EDITORIAL

China

CHINA is so great a country and our trade with it so varied that the present chaotic conditions fill the more timid of us with disappointment and alarm. When, however, we consider the essential facts, there are found sundry features which help to restore our equanimity. China is a country which is comparable in size with Europe rather than with Britain; it has a population of about four hundred and fifty millions of people, including some twenty thousand, or less, foreigners congregated in comparatively few places. The foreigners have come into contact with very few of the Chinese, probably not more than a fraction of 1% of them. On the whole, the Chinese who have come into contact with the foreigners have been friendly, trusting, and trusted. There has been no ill-will, no suspicion; on the other hand, there are probably four hundred and forty millions of Chinese who know nothing of the foreigners, care little about them, and are comparatively easily incited to dislike them. A small proportion of these—a very small proportion—is now completely out of hand. The civil wars which have distracted China during recent years have, fortunately, not involved the whole number of men of military age; it is doubtful if at the present time one-tenth of 1% of the population is under arms. Much has been written and said about the efforts made by the foreigners to protect the settlement at Shanghai, a property about the size of Hyde Park. Whether these efforts are wise, necessary, futile or provocative, is not the concern of this JOURNAL. We are justified in calling attention to the fact that only a small proportion of the population has departed from its customary industry, and only an insignificant acreage, a mere field in a continent, is troubled by the armed forces of the foreigner. In these circumstances we are not surprised to learn that the trade of China has so far remained steady, that the factories, on the whole, maintain their normal output, and that no great diminution in exports and imports is yet manifest.

The American Institute of Chemistry

So there is to be an American Institute of Chemistry, but not, let us hasten to explain, with the scope and functions of the British Institute. The idea, sponsored by the American Chemical Society, appears broadly to consist in affording American chemists an annual grand opportunity of combining pleasure and profit under the most agreeable of conditions. The first session is to be held this year at the Pennsylvania State College, the funds being provided by the latter and the Chemical Foundation. The North Western University will hold itself responsible for the second annual session of the Institute, and there appears to be little doubt that the Institute will be backed in succeeding years. During each session a series of morning and evening lectures and demonstrations is to be arranged, whilst the afternoons will be given over to recreation. It is truly said by our contemporary, the *Journal of Industrial and Engineering Chemistry*, that in these days of extreme specialisation many chemists find no opportunity of keeping abreast of modern developments, and that lectures given by those best qualified to speak will be of great benefit. We claim no right to interfere in the family matters of the American Chemical Society, especially as we are confident that the plan has been evolved with a full knowledge of American temperament, but we conceive that a similar organisation would find little favour in this country. We take our pleasures sadly, maybe, but we do take them, and as the Englishman's home is his castle, so is his holiday his very own. Now that April is here, both poet and chemist revel in the glory of England, and during the few days' break at Eastertide, just as during the summer holiday, we shall go pleasure hunting with ne'er a thought of chemistry. Our American friends are not entirely to take a busman's holiday all the same, for in the agreeable climate of the Pennsylvania hills much enjoyment will be possible to the angler, the motorist, the "hiker" and to all manner of men.

At the same time we cannot think that the average chemist—we have writ much of the average chemist these latter days, but we hope we are not overworking the term—would take kindly to a holiday “with just enough serious work thrown in to keep the time from dragging.” Have we, after all, spoken critically of the American Institute of Chemistry? The temperament of the American is quite different from that of his English cousin, who could never bring himself happily to instal a dictaphone in his bedroom, but there is much else behind our remarks. Chemical organisations in this country have much to learn from the American Chemical Society, which, representing nearly 20,000 chemists, speaks with authority in matters national. Our efforts for many years must be in the direction of bringing about consolidation within the ranks of British chemists. American chemists have the American Chemical Society and may smile contentedly upon the new Institute. We have not yet got Chemistry House.

The Utility of the Electron

One evening recently an enterprising gentleman walked into the editorial sanctum—why it is called a sanctum, we do not know—and placed a polished case upon the editorial table. After a few words of explanation, the young gentleman proceeded to turn a few knobs and, behold, to our surprise, a voice issued from the case and informed us that it was Daventry calling, to be replaced after a few minutes by the guttural warning “Achtung,” evidently from Berlin, and, a little later, by a Parisian who told us what it was that we “came from hearing.” We had previously conceived wireless reception as an operation usually carried on amidst a tangle of wires, but the Rees-Mace Manufacturing Company, who were responsible for the demonstration which had charmed our ears, place everything that is required in a neat case which can be carried about with ease. An inspection of the interior of the apparatus suggested that some nice problems had been solved in the disposition of the components and reminded us that broadcasting owes more to chemistry than it has yet acknowledged. Pure copper wires and other products of the metallurgist, insulating materials such as ebonite, bakelite and so on, colloidal compositions of high electrical resistance, special magnetic materials, and, of course, the thermionic valve, all these are primarily due to the applications of chemistry. The thermionic valve or “tube,” as it is known in the United States, presents interesting possibilities for the measurement of the conductivity of electrolytes, for electrometric titrations, the analysis of gases and similar physico-chemical applications. We do not know if such applications of the valve are common practice; perhaps one of our readers will write and tell us about them. It is an amazing thing to be able, by means of a small box without external connexions of any kind, to hear people speaking and pleasant music from great distances. It has been described as unprofitable to gain the whole world and lose one's own soul. But the offer of access to a goodly part of Europe, simply by expending thirty-five guineas on a Rees-Mace set, is a very strong temptation.

NITROCELLULOSE LACQUERS AND ENAMELS

By HARVEY S. GARLICK

By the treatment of cellulose-containing material with nitric acid in the presence of sulphuric acid, a substance containing from 10 to 13% of nitrogen can be obtained. That containing from 11.2 to 12.4% nitrogen is characterised by high solubility in numerous organic solvents, and is known as pyroxylin. It forms the basis for most of the so-called “cellulose” lacquers and enamels now appearing on the market. Gun cotton is a nitrocellulose of from 12.4 to 13.0% nitrogen content, and is much less soluble. Nitrocellulose containing 10.2 to 11.2% nitrogen is also less soluble than pyroxylin, but is, however, soluble in anhydrous ethyl alcohol.

A solution of nitrocellulose on evaporation leaves a hard, transparent and lustrous film, which, however, is somewhat brittle, though by the incorporation of certain “plasticisers” this difficulty is overcome. The film so obtained does not possess the high sheen of a spirit or oil varnish, but this defect may be remedied by dissolving in the nitrocellulose solution one or more gums or resins. Such a solution yields a film which is equal in finish to that obtained from the highest class of spirit or oil varnish, but is much harder and more resistant to water and wear. Clear transparent solutions of nitrocellulose are called lacquers. By the incorporation of finely-ground pigments, opaque enamels are made which are now rivalling, and in many cases replacing, the older paints and enamels made up in an oil medium.

The foundations of this industry were laid in 1881, when Stevens introduced amyl acetate as a solvent for nitrocellulose. Previous solvents, such as ether-alcohol mixtures and wood spirit, gave, on evaporation, distorted and often cloudy films. By the use of amyl acetate these initial difficulties were overcome, but the rapid growth of the industry led to a shortage of this solvent, and search was made for other and cheaper solvents. Further mention will be made of these later.

The nitrocellulose manufactured until a very short time ago was such that only a few ounces could be dissolved in a gallon of solvent if the solution was not to be too viscous for use. Films from such solutions were very thin, and to obtain a reasonable protective coating a considerable number of applications was necessary. This led to their use only as tarnish preventatives on silver and brass. Research has led, however, to the production, within the last few years, of “low-viscosity cottons,” that is, of nitrocellulose which will dissolve in large quantities and still give solutions fluid enough to apply.

The great advantage possessed by the nitrocellulose products is the rapidity with which they dry, each coat taking, on an average, about half an hour. Once the solvent has evaporated, a stable film remains, as there is no chemical action to set in such as occurs with the older paints employing drying oils and turpentine. Apart from this, it has been demonstrated that far fewer applications are necessary. A high-grade automobile is reputed to be given some twenty or more coats of enamel before reaching a satisfactory condition. A maximum of six coats of a nitrocellulose enamel would produce a

finish the equal of the other in gloss, and superior in resistance to weathering, scratching, or action of petrol. It will also be found that washing and cleaning actually increase the lustre.

Nitrocellulose products are being used by the automobile industry and by furniture makers, both for wood and metal, whilst a third field is now being cultivated in interior decoration and home use.

INGREDIENTS

Nitrocellulose

Cotton fibre, too short to use for spinning or other mill waste, carefully cleaned, is the raw material for the production of nitrocellulose. This is treated with mixed nitric and sulphuric acids under carefully controlled conditions, the properties of the resultant product being particularly dependant on acid concentration and the time and temperature of reaction.

The nitrated cotton, still resembling the original material in appearance, is thoroughly washed till free from all acid, pulped, lightly centrifuged or pressed, and the remaining water removed by displacement with alcohol. The nitrocellulose is usually marketed containing 30% of alcohol, but there is a tendency for the actual lacquer manufacturers to order their material already dissolved in a specified solvent.

Until comparatively recently the nitrocellulose manufactured was that known as "high viscosity cotton"; that is to say, only a small amount could be dissolved without producing a solution too viscous to use. Recent research has shown that treatment with certain compounds or heating under pressure will remove this objection, and solutions are now made containing as much as 30 oz. of nitrocellulose per gallon, as compared with a maximum of 6 oz. of the older type of product. This permits films of good thickness to be deposited at each application.

It is usual to judge the solubility of nitrocellulose by its viscosity in a specified solvent. Acetone is the solvent usually chosen as standard, although solutions in this liquid are apt to give viscosities much lower than those obtained in commercial practice.

Several means of determining viscosities are available, but the simplest and most widely used is the falling sphere method. In this method the viscosity is judged by the time taken for a standard steel ball to fall through a definite column of the solution. Commercial nitrocelluloses vary in viscosity between fairly wide limits, depending entirely upon the conditions of their manufacture. High-grade enamels and wood lacquers require a nitrocellulose of the lowest viscosity. For cheaper products a higher viscosity material suffices, whilst a bronzing liquid must contain a nitrocellulose of high viscosity in order to keep the bronze powder in suspension.

Solvents and diluents

A nitrocellulose film is formed simply by deposition from solution as the solvent evaporates. No oxidation or polymerisation has to take place in order that it may be produced. The time taken to obtain such a film, therefore, depends upon the rate of evaporation of the solution. Thus, in general, the lower the boiling point

the more quickly the surface coated will be in a condition for use. This is not strictly true, because rate of evaporation does not depend only upon the boiling-point of a liquid, although the boiling-point can usually fairly accurately be taken as an indication thereof.

Although it would seem advantageous to use as low boiling a solvent as possible, difficulties are introduced here, because, owing to rapid evaporation, the temperature of the surrounding atmosphere is lowered to such an extent that the dew-point is reached, and moisture is deposited upon the film. This causes "blushing"—that is, precipitation of the nitrocellulose, with the consequent formation of a film lacking in hardness and adherence. To a low-boiling solvent is therefore added a high-boiling solvent to slow down the rate of evaporation sufficiently to prevent the occurrence of blushing.

Solvents for nitrocellulose are comparatively expensive, and it is practically impossible under the varied conditions of use to attempt to recover them. They are therefore almost invariably diluted with certain non-solvents. A diluent must be perfectly miscible with the solvents employed, and must not cause precipitation of the nitrocellulose, either on addition or at any stage during the evaporation of the solution. Only three non-solvents have found any extensive use in the industry—namely, benzene, toluene, and light petroleum spirit. Low-boiling solvents are diluted with benzene and high-boiling solvents with toluene. If a low-boiling solvent were diluted with a high-boiling non-solvent, the former would evaporate more quickly and "solvent blush" would occur—that is, precipitation of nitrocellulose through excess of non-solvent.

No one solvent has been found ideal in its boiling-point, rate of evaporation, solvent power and so on; it is therefore almost invariably the rule to use a mixture of liquids. Experience has shown that the smoother the distillation curve of such a mixture the better the film obtained therefrom. A light, suitably cut petroleum spirit is therefore an excellent non-solvent to use in order to obtain the correct boiling range. Technical solvents, however, usually contain at least traces of water, or are liable to absorb water, and when using a petroleum spirit great care has to be exercised in order not to obtain a turbidity.

One other point that should be mentioned is that in any series of liquids that may be solvents—such as ketones or esters—the lowest members are always the best solvents. Increase in molecular weight decreases the solvent power.

Since nitrocellulose does not form a true solution, it is impossible to obtain any saturation point by which to compare various solvents. Addition of more nitrocellulose merely increases the viscosity of a solution. It is therefore usual to compare the solvent power of liquids by dissolving in 100 c.c. of each 5 grams of the same nitrocellulose, at a temperature of 20° or 25° C., and noting the amount of a particular non-solvent required just to produce precipitation.

Of the many liquids proposed as nitrocellulose solvents, those used to any great extent by the industry are ethyl, butyl and amyl acetates, acetone, methyl ethyl ketone, wood spirit, and ethyl lactate. Butyl propionate,

diacetone alcohol, and hexalin acetate are also used, but to a smaller extent. Alcohols also always find a place in lacquer formulæ. Whilst not true solvents, since the pure substances only cause gelatinisation of nitrocellulose, the alcohols cannot be classed as inert diluents, since the presence of small quantities of other bodies will convert them into powerful solvents.

Methyl alcohol in the form of wood spirit was one of the solvents first used for nitrocellulose lacquers, and it owed its solvent properties to its content of acetone and other impurities. Ethyl alcohol, as already mentioned, is used for dehydrating nitrocellulose, which is often marketed containing 30% of this body. Anhydrous ethyl alcohol has recently been experimented with in the United States in conjunction with a nitrocellulose of slightly lower nitrogen content. Excellent results are reported to have been obtained. Several solvent mixtures are also on the market there, consisting of anhydrous ethyl alcohol plus a small percentage of an ester. Butyl alcohol is now produced in large quantities by a fermentation process, and has largely replaced amyl alcohol in lacquers. It is an excellent blending agent, and forms a constant boiling mixture with water distilling at 92° C. Fusel oil or pure amyl alcohol is also often included in lacquer formulae. The presence of a higher boiling alcohol promotes the formation of a nitrocellulose solution of good flowing properties, giving a smooth and lustrous film. The alcohols, too, are the best solvents for many of the gums and resins used, and are often included for that reason.

One remarkable feature about the nitrocellulose lacquer industry is the fact that the search for suitable solvents and plasticisers has led to the commercial production of numerous compounds previously regarded as purely laboratory curiosities.

Some of the cheaper lacquers employ scrap celluloid as the nitrocellulose base in solutions containing acetone as the principal solvent. Such lacquers do not produce as satisfactory films as those obtained when a high-class low-viscosity nitrocellulose is used. The reason is the variability of the raw material. This always contains camphor also, which slowly volatilises from the dry film and leaves it porous. Solutions containing large amounts of acetone also tend to give matte surfaces, and are more prone to absorb moisture than is desirable. The best films are obtained by the use of anhydrous materials.

Plasticisers

A film of nitrocellulose alone is inclined to be brittle, and when subjected to strain is apt to arch away from its support. This defect is overcome by the addition of a "plasticiser" to the lacquer. The film thus obtained is flexible and adhesive.

The first compound used of any importance in this respect was camphor. It was fairly effective, but in time it evaporated from the film and left it porous and brittle. Castor oil and linseed oils—both raw and boiled—replaced camphor, and still find considerable use, more especially in the cheaper lacquers and enamels. Castor oil is almost invariably a constituent of leather dopes, and aeroplane dopes usually contain it too.

Linseed oil is not popular as a plasticiser, owing to its

drying qualities, whilst the smell and property of tending to make the film too soft are against castor oil. High-class lacquers and enamels utilise for this purpose high-boiling solvents, almost always an ester, the most useful of which are triphenyl and tricresyl phosphates, butyl stearate, butyl tartarate, dibutyl phthalate, and triacetin. Benzyl alcohol is also occasionally used, more especially in this country.

Gums and resins

Practically all nitrocellulose lacquers and enamels now made contain some resin. The reason is twofold. The resin increases the gloss and adhesion of the coating, and secondly, since the addition of resin to the nitrocellulose solution does not appreciably raise the viscosity, it allows the production of a solution of greater total solid content.

The gums and resins used are often not completely soluble in the solvents of the lacquers. It is usual, therefore, to dissolve as much as possible in a particular liquid, separating the clear liquor, and either adding that to the nitrocellulose solution, or else evaporating to obtain the resin and redissolving that with the nitrocellulose.

The gums and resins utilised are usually those used in the spirit varnish trade, but in order to obtain a transparent film, hard and durable, and of high and permanent gloss, it is invariably necessary to use a mixture of two or more. The most widely-used resins are shellac, mastic, dammar, copal and sandarac. Synthetic resins, such as ester gum—made by esterifying rosin with glycerin and albertol—a product of the bakelite type—have also found favour.

Pigments and dyes

Of the innumerable pigments and dyes available, only those of the highest tone and maximum covering power have been used. Pigments must be extremely finely ground in order that they may remain in suspension. Some lacquers contain low-viscosity nitrocellulose, in order to obtain the maximum total solid content, blended with a small quantity of higher viscosity nitrocellulose in order to obtain sufficient body to support the pigment and keep it in suspension.

Application

Until quite recently the only method in use for the application of nitrocellulose lacquers and enamels was spraying. Recent improvements, however, have led to the production of these materials in a condition perfectly suitable for brushing. The solvents used in this case must be such that, whilst sufficient time is allowed for the brush marks to smooth out, they must not be so rapid in their action of dissolving nitrocellulose that they cut through previously applied coats.

Whilst the consumption of nitrocellulose lacquers and enamels in this country is still small compared with that in the United States, there is no reason, now they have obtained a good footing, why they should not as rapidly increase in popularity. Such being the case, enormous quantities of solvents will be required, and will lead to the growth of a new branch of the chemical industry in this country.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

ANNUAL GENERAL MEETING, JULY 4 to 8, 1927

In accordance with the provisions of By-law 68, notice is hereby given that the Annual General Meeting of the Society of Chemical Industry will be held in the Debating Hall, The Union, University of Edinburgh, on Tuesday, July 5, 1927, at 10 a.m.

A preliminary programme appeared on page 265 of CHEMISTRY AND INDUSTRY, for March 25, 1927, but a more detailed programme will be issued shortly.

In accordance with the provisions of By-law 23, notice is hereby given that the following members of Council retire from their respective offices at the forthcoming Annual General Meeting:—

Mr. Francis H. Carr, C.B.E., *President*; Dr. E. Frankland Armstrong, F.R.S., Professor J. W. Hinchley, Professor J. C. Philip, F.R.S., and Sir Richard Threlfall, K.B.E., F.R.S., *Vice-Presidents*; Mr. W. A. S. Calder, Mr. W. H. Coleman, Dr. William Cullen, and Mr. J. Arthur Reavell, *Ordinary Members*.

Mr. Francis H. Carr, C.B.E., has been nominated for re-election to the office of President under By-law 19, Mr. E. V. Evans, Mr. C. S. Garland, Dr. H. Levinstein, and The Right Hon. Sir Alfred Mond, Bart., M.P., have been nominated Vice-Presidents under By-law 20.

Dr. E. W. Smith has been elected Hon. Treasurer, and Dr. E. Frankland Armstrong has been elected Hon. Foreign Secretary.

Members are requested to nominate on or before May 13 next fit and proper persons to fill the four vacancies among the Ordinary Members of Council. Forms for this purpose can be obtained from the General Secretary of the Society.
